

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

REVIEW OF NEW BOOKS.  
WOOD ENGRAVING IN FRANCE.

*Histoire de Gil Blas de Santillane, par Le Sage. Vignettes par Jean Gigoux.* (Gil Blas, with Woodcuts from designs by Gigoux.) One large vol. 8vo. Paris, 1836. Paulin.

*Œuvres de Molière, précédées d'une Notice sur sa Vie et ses Ouvrages par M. Sainte Beuve. Vignettes par Tony Johannot.* (Works of Molière, with Woodcuts from designs by Tony Johannot.) 2 vols. large 8vo. Paris, 1836. Paulin.

*L'Ingénieux Hidalgo Don Quichotte de la Manche, par Miguel de Cervantès Saavedra, traduit et annoté par Louis Viardot. Vignettes de Tony Johannot.* (Don Quixote, with Woodcuts from designs by Tony Johannot.) 2 vols. large 8vo. Paris, 1838. Paulin.

*Paul et Virginie, par Bernardin de Saint Pierre.* (Illustrated edition of Paul and Virginia.) Large 8vo. Paris, 1838. Curmer.

In France, the number of illustrated publications is much greater than in England, and, generally speaking, they are executed in a superior style. A few of them are already well known in this country, and none more so than the four books of which the titles stand at the head of the present article. Of some of them, various London publishers, having obtained casts of the woodcuts, have issued English editions, with English texts. But the greater number of those which are now in the course of publication are scarcely known here; and we think we cannot begin the new year more appropriately than by bringing them before the reader. We also have obtained a series of casts of the engravings themselves, by means of which we hope to give a better idea of these truly splendid works.

In the earlier ages of the art, the French wood engravers attained no great excellence or eminence; they produced nothing that could be compared with the works of the German artists, and little even that deserves comparison with the spirited vignettes which are common in books printed in Italy during the sixteenth century. The successive invention of the different methods of engraving on copper, and the many advantages with which they were then attended, when engraving on wood was accompanied with more difficulties than it is at present, caused the latter to fall into neglect throughout Europe about the earlier part of the seventeenth century. During nearly two centuries it was a despised art; the development of which it might be made capable was not understood; and it was exercised only by the clumsiest and most ignorant workmen, who laboured to produce head-pieces for the ballads that were hawked about the streets, or rude initial letters and other ornaments for the more ordinary books. During this long period we do, it is true, meet with one or two artists, who deserve, by their comparative skill, to be distinguished from the common herd. But, until the appearance of our own countryman, Bewick, at the end of the last century, for whom the persons we have just mentioned prepared the way, very little was done towards reviving this art.

So much has been said of Bewick of late years, that it is quite unnecessary to give any account of him on the present occasion. He enjoyed the great advantage of engraving his own designs; as a delineator of rural life, he was extremely clever and original; but, when we take him simply as a woodcutter, we do not hesitate in stating as our opinion that his works have been much overpraised.

Bewick introduced a method of working which was altogether contrary to the first principles of the art; he rejected the use of bold outlines, which ought always, in designs such as he chiefly committed to the block, to have distinguished engravings on wood, and in their place he adopted a mode of producing indefinite shades, which, in many instances, produced the worst effect possible, because not bounded by outlines at all. It is thus that sometimes we cannot easily determine whether a man has a hat upon his head, or merely a bundle of straw, which has taken somewhat the form of a hat. His designs of rural life and scenery are often admirably conceived, but in most cases he has failed to carry out his own design in the process of engraving, because he was not master of his tools—at least by no means so much so as the engravers of the present day; or, perhaps, because he had fallen upon a bad style of working. Bewick is praised for having first given something of detail to the trees in woodcuts; but it must be confessed that, in a great number of instances, his success is far from complete: the trees in his distances, if it were not sometimes for the shape of the mass, might be taken for haystacks, and the detail of the foliage of trees which are more in the foreground is too often disproportionate to the trees themselves, and to the rest of the picture, and gives them too much the appearance of bushes. Bewick's undefined shading was effective only in producing the soft plumage of birds, and the hair and fur of animals; and it was in these, particularly the former, that he excelled. There can be no stronger proof of the injudiciousness of his style of wood-engraving than the circumstance that none of the modern engravers have followed him in it. Even modern engravings of birds and animals are, in our opinion, far superior to those which were executed by Bewick: although none of those which have been attempted to be engraved in imitation of his peculiar style. It may be observed that most of Bewick's ardent admirers praise his execution for what really belongs to his design alone, and what, probably, would have been far more effective in a drawing than it is in his engraving.

In spite, however, of all this, Bewick deserves a high place in the history of wood-engraving; first, because he struck out a new and original path, and so brought the art into reputation; and, secondly, because his influence led the way to the introduction of that more minute detail and that rich finish which characterise the style of the English engravers of our day. Bewick may be considered as the first of the modern wood-engravers who had a characteristic style: and he brought into regular practice some operations which had pre-

viously been adopted or rejected capriciously, or used only on occasions. It has been stated that he was the first who caused the surface of his blocks to be cut perpendicularly to the grain, his predecessors in the same line having had the surface of their wood smoothed in a direction parallel to the grain, so that they were obliged to cut across it; and he is also considered generally as the person who brought into general use the practice of *lowering* the wood for the lighter parts. But, we believe, there can be no doubt of both these methods having been in use among some of the older workmen.

For a long time after Bewick had brought wood-engraving into repute, it advanced slowly, and received no great improvement. There arose many engravers who worked better than he did in the mechanical practice of the art; but their pictures were deficient in effect; and even till within the last sixteen or eighteen years, the generality of the woodcuts which were executed in England were exceedingly flat and inefficient. In France, much less had been done towards perfecting this art than in England; and it did not become popular there until it was carried over by English artists. Charles Thompson, a skilful engraver on wood, who was formed in Bewick's school, settled at Paris in the earlier years of the restoration.

The success which attended Thompson's labours at Paris encouraged a number of native artists to emulate each other in their efforts to bring wood-engraving to perfection. The French engravers adopted a style which is quite their own—one which was altogether contrary to that so much in favour among the English artists. They took up the strong characteristic outlines which Bewick had thrown away; their models were to a certain degree the works of Albert Durer, and of some of the old masters. The turn of imagination and art in France made them choose scenes from life, rather than scenes from nature to work upon. While the wood-engravers in England were aiming at delicate workmanship, the French produced cuts which resembled the finest pen-and-ink sketches; and by bringing into general use the bold cross-hatching of the old artists in their darker shades, they have given to their pictures an admirable effect. The English engravers have been too much in the habit of representing darker shades by leaving the surface of the wood untouched, which, therefore, when properly printed, gave a solid and uniform black. But, not to speak of the difficulty of printing such work, an uniform shade of black must always produce more or less the effect of a flat surface, which is a great defect in the picture where it is used.

Among the first who distinguished themselves much in France in the art of wood engraving, and who have scarcely been equalled by any of those whom they have taught, were Brévière, Godard, Andrew Beut and Leloir, and Purret. L. H. Brévière deservedly stands at the head of the French artists in this line. He first distinguished himself as a painter, having been a pupil of J. B. Descamps, of

Rouen. After having practised in *taille-douce* for several years, he turned his attention to engraving in wood, in which he made some attempts as early as 1819. Most of the cuts which he executed previous to 1830 were designed for the works of his friend, E. H. Langlois. In that year he was elected a member of the Académie des Sciences, Belles Lettres, et Arts, of Rouen; and he engraved, after designs by Aimé Chenavard, most of the plates of the Album of the Imprimerie Royale destined for the King and Queen of Naples. In 1832, he was appointed to execute the border illustrations of the magnificent series of Oriental publications, undertaken also by the Imprimerie Royale, of which some volumes have since appeared. In 1834, Brévière fixed his residence in Paris; and in the same year he obtained the gold medal given at the annual exhibition of arts at Rouen, and which has since been frequently confirmed to him. It was about this time that the taste for the works illustrated with woodcuts, to which we are now calling the attention of our readers, arose in France. Scarcely a work of this kind has since appeared to which Brévière, as well as the other artists mentioned above, did not contribute more or less. The increasing demand for such works has brought into notice a number of younger artists, some of whom have almost, if not quite, equalled their teachers. Among them we may mention the names of Chaussefoin, Piaud, Roussel, and Lavoignat. We might add many other distinguished names to this list.

However, this great multitude of illustrated works is also producing its evil; it has a powerful tendency to lower the art, by making it a trade rather than a profession. The skilful engravers are no longer able to produce cuts in sufficient abundance, or with sufficient rapidity, to satisfy the calls of the booksellers; they have been obliged to establish large workshops, filled with apprentices and scholars, who now do much of the work; and the names of the best engravers, sometimes even that of Brévière himself, are seen attached to engravings which are quite unworthy of them, and to which, at best, they have only given two or three strokes of the graver to finish them off. What is still worse, the apprentices take advantage of the laxity with which the laws relating to them are administered in France, and seldom serve out the period for which they are indentured; after a few months they leave their masters, and set up in business for themselves, before they have been entirely perfected in their profession; they also take apprentices, who, in their turn, desert, and become master engravers. So that by this means, and from the disposition of the booksellers to employ cheap workmen, Paris will soon be deluged with wood-cutters, who possess little skill or talent; and able hands will find no encouragement to cultivate the art, which must therefore naturally degenerate.

The first, and still the best, of the French illustrated publications was the *Gil Blas*, with designs by Gigoux. We are disposed to find one fault in most of these illustrated works; the immense number of engravings which they contain takes off much from the individual effect of each. When we run our eye in succession over several hundred pictures,—when the same costume, the same characters, and similar ideas, perpetually recur, we perceive a certain uniformity about them which seldom fails to become tiresome. This effect is most strongly perceptible in the illustrated editions of “*The Arabian Nights*.” In *Gil Blas* it strikes us least, because the story presents a

great variety of characters and incidents which afford a larger field to the genius of the designer. In the thousand vignettes which are lavishly scattered over the pages of *Don Quixote*, this sameness is more apparent; and we feel it very disagreeably in the illustrations of Molière, arising out of the stage attitudes which are given to most of the figures. But, taken individually, the French illustrations are far more judicious than the designs which adorn most of the publications of a similar description that have appeared in England. The object which the French artist always has in view is to embody in a picture the spirit and meaning of his author; the back-ground is but an accessory, which is only introduced so far and in such cases as it is necessary, or adds to the effect of the whole: but it is the actors who form the prominent portion of the design. On the contrary, most of our English artists are intent only on making a beautiful landscape, or on giving scope to display the engraver's delicate workmanship; and the real subject of the piece is too often embodied in a group of minute figures, possessing neither action nor expression, which require to be sought before we are aware of their presence. This is a fault which is frequently committed in Knight's

editions of “*Shakspeare*” and the “*Arabian Nights*.” Perhaps the French artists are rather too constant in their style in this respect; for it tends to increase in large volumes the disagreeable air of uniformity to which we have alluded above; a landscape here and there would give somewhat more of variety to the whole. The French artists, however, are far inferior to our countrymen in designing and engraving landscapes, which seem to be contrary to their taste. There are not more than one or two sketches of landscapes in *Gil Blas*; we may point out as the best the vignettes at pp. 361 and 956, both of which appear to be the works of English engravers. The beautiful sketches in *Paul and Virginia* (the model on which Wordsworth's “*Greece*” has since been formed) were nearly all engraved in England; the best of them by Orrin Smith. One or two very beautiful engravings in this book bear the mark of Mary Ann Williams.

The first cut is from the graver of Godard. We give it as a specimen of the numerous portraits which illustrate the pages of *Le Sage*; though not perhaps the best portrait in the book, it is a bold design. It represents *Gil Blas*' last master, the minister Olivares.

This portrait may be compared with one of an entirely different character, which we extract from Paulin's *Don Quixote*. It represents the sage writer of the pretended history of the

adventures of the Knight of La Mancha, Cid Hamet Ben-Engeli, the Moor. We shall return to *Don Quixote* in our next article.

Paulin's edition of *Gil Blas* is full of choice. The following cut has all the freedom spirited sketches. It is difficult to make a of an etching.

It represents the dinner-party in the palace of the Archbishop of Grenada, which Le Sage has described with so much humour. The

figures of the ecclesiastics are full of character. We have seen few woodcuts where the cross-hatching was introduced with equal effect.

1. *Chapters of the Modern History of British India*. By Edward Thornton, Esq. author of "India, its State and Prospects." 8vo. pp. 644. London, 1840. Allen and Co.
2. *Continental India: Travelling Sketches and Historical Recollections, illustrating the Antiquity, Religion, and Manners, of the Hindoos; the Extent of British Conquests; and the Progress of Missionary Operations*. By J. W. Massie, M. R. I. A. 2 vols. 8vo. London, 1839. Ward and Co.

INDIA, always of vast and still increasing importance, is presented to us in two different ways in these works. Mr. Thornton, well known for the information and ability he brings to any subject connected with that extraordinary empire, has here entered into a distinct view of its concerns during the present century, and lays before us his opinions thereon. The mutiny at Vellore, the appointment of a governor-general in 1806, the affairs of Travancore, the conquest of Bourbon and Mauritius, and the Dutch settlements, the renewal of the charter in 1813, the Nepal war, the disputes with the Peishwa and the Guicowar, the events at Poona and Nagpore, the Pindarries, the disturbances at Bareilly, the Burmese war, the siege of Bhurtpore, and the great change in 1833, are all treated in a very lucid and striking manner. Mr. Thornton is a warm advocate for the Company, its policy and its government; and we cannot illustrate his volume more effectually, than by summing up some of his arguments most applicable to the present condition of things:—

"The history of the East India Company from its commencement has been extraordinary; and the suspension of its commerce, the sole purpose for which it was formed, is not the least extraordinary part of that history. There was some plausibility in the principal objection taken to the continuance of the Company's trade with India, that the characters of merchant and sovereign were incompatible; but that objection did not apply to its trade with China, the sacrifice of which was a tribute to ignorant and interested clamour. The Company's exclusive privileges were eminently useful in extending and maintaining our commercial relations with a country with which it is difficult to maintain intercourse at all, and those privileges were so carefully guarded that they could not be abused. No impartial person, whatever his opinions on freedom of trade, can read the evidence on the China trade given before the parliamentary committees, without feeling convinced that the Company's exclusive rights ought to have been maintained. Government determined otherwise, and the reproach of having thus determined is not peculiar to the party which happened to be then in power. Whig and Tory were alike ready to surrender the trade of the Company to those who clamoured for its destruction. No rights, however well established, no interests, however important, are safe, where statesmen, abandoning their true position, are content to follow, instead of leading, the public voice. The China trade of the Company was a positive benefit to India, that country being relieved thereby to the extent of the surplus profits of the trade. It was determined that India should no longer enjoy this benefit, but that the profit (or the loss, as the case might be) should be allotted to England. It is remarkable that the interests of India should be invariably sacrificed whenever they are the subject of British legislation. India has sustained pecuniary loss by the withdrawal of the China trade from the Company. The Company sus-

tained some diminution of influence, and various classes of their servants were deprived of employment, which they had calculated would continue as long as they were able to follow it. Amidst this mass of loss and inconvenience, who has gained? It is very doubtful whether either the successors of the Company in the China trade, or their customers, the purchasers and consumers of tea, can give a satisfactory answer to the question. Next to the abolition of the Company's China trade, the most objectionable parts of the new measure appear to be the refusal of the rule of publicity, and the transfer of so large a portion of the power formerly enjoyed by the subordinate governments, to the governor-general. As to the first, it is certain that both individuals and bodies of men may conscientiously differ, and that their differences may be irreconcilable; but in such cases no ground for concealment seems to exist. Neither party need feel shame in avowing opinions which are the result of honest conviction. With regard to the second, it cannot but excite surprise that it should have been deemed either necessary or prudent to concentrate nearly all power in the chief government. The motives to this course were never adequately explained. Although deprived of some advantages which they had previously enjoyed under the Company's rule, the people of India had reason to rejoice that the Company was still preserved as an instrument for the government of their country. That portion of the people of England, who do not desire to see the combatants for political power every thing and the rest of the people nothing, have equal reason to be satisfied with this result. That the Company agreed to accept the important trust, under conditions to which strong objections were entertained, may be attributed to the recommendation of the majority of the directors, headed by Mr. Astell, a gentleman, whose experience, sound judgment, and high character, were eminently calculated to inspire confidence in his views, and give weight to his advice. Happily this advice was successful, and India has yet to boast of being incomparably the best governed of the dependent possessions of Great Britain. It does not fall within the limits of this work to speak of the events which have followed the changes now related; but it may be observed, in closing this chapter, that, during the few years that have since elapsed, the British dominion in India has lost nothing of its grandeur or solidity, but that both have been maintained with spirit and success."

With regard to Mr. Massie's publication, readers will see from the title-page that it is of a very miscellaneous character. Strong religious feelings predominate throughout, and the cause and proceedings of the missionaries are cordially maintained, whilst the superstitions of the natives are severely condemned. In his historical notices the author has written impartially and clearly; and has bestowed diligence and re-search upon his task. But the chief novelty to be found in his pages is in the account of his personal travels through various parts of the country; and from this we choose the few specimens for which we can afford room. At Mysore,—

"The parade and sports in the palace-yard were frivolous and servile in the most abject degree;—wrestlers striving for prizes; gettee fighters contending for victory; sparring and boxing were the most manly amusements which I witnessed; and these were for the rajah's pleasure. The combatants were shaven, and the upper parts of their body entirely naked: the boxers were armed upon one fist

with weapons made from buffalo-horn. The tradesmen appeared in procession, and did obeisance, prostrating themselves to the ground, acknowledging the benignity of their ruler. Thousands of people were gathered within the court-area with slavish adulation, ready to raise their admiring voices. Buffaloes to fight with each other, trained and prepared by shaving for the conflict; elephants, to contend with the buffaloes, or still fiercer tigers, or to dance among fire-works; were then brought upon the stage. A tiger had been caught in the jungle a few days before, by men whose business it was to take him in his lair; he had been kept for the feast, and fed on short allowance, at the same time to lessen his strength, and add to his ferocity when let loose: when led into the area to contend with an elephant, his keepers slipped their noose, and let him free. I did not see the result, but was told that he declined the combat, leaped over the fence, and cleared a way for himself through the avenues of the court. This afforded unexpected sport to our European guests, and the tiger-hunt in the streets of Mysore assumed all the animation, but more of the hazard, of a forest scene. No one knew, or at least, no one repeated injuries inflicted on the people, whether any were killed or not, but the tiger was not allowed to escape: the gun and aim of the sportsman were too much for him in a region where he was a stranger. The tiger is never a match for a trained elephant. I do not know if they be natural enemies, and contend when they meet in the jungle. The claws and teeth of the tiger can make no impression on the scaly hide of the elephant, whose only weak point is his proboscis. This he generally turns to its highest possible curve; and then he contrives to bring his adversary between his hind and fore-leg, to kick him forward and backward, and then, when down, to tread him under foot: for the tiger, in such a state, death is certain. The scenes of merriment in which the Mohammedans delight, when unawed by the presence of Europeans, indicate their degree of refinement and their ambition. Representations painted on pasteboard are carried about, followed by crowds of pleasure-seeking Moslems: these are amused by tumblers and dancers, whose movements are all rendered sonorous by the ornaments and bells fastened on their limbs; masks are used by others; and the form of tigers, led in chains, creeping on all fours, or roaring and springing about among the crowd, is assumed by the performers. The combats of negroes are assimilated by others, painted as African blacks, and armed with short staves. The myriads who saunter forth adorn themselves with the gayest clothing, turbans of every colour—green the most sacred, but red, brown, and purple; blue, rose, and pink, vary their aspect; sailing onward with wide silk trousers, and flowing shawls over their shoulders, they gather round the dancing girls; groups of whom, covered with tinsel toys, dressed in soft muslins and gay silks, and carrying on their heads plates of gold, employ themselves to fascinate or receive the wages of degradation. Torches, fire-works of all kinds, horsemen on their prancing and neighing steeds, and squires, with all the delusive assumptions of religious hypocrisy, diversify their occupations. Jugglers, and performances on the magic lantern, elicit the merry shout, or perplex the more inquisitive idlers who wander through the streets. Among the curiosities of the capital was an elephant-carriage, which had been constructed under the direction of the rajah, and in which his high-

ness occasionally took an airing. It was sometimes used for the gratification of visitors at the residency. Six elephants were yoked and harnessed in this vehicle: their trappings and harness would be a load to a common horse; each elephant carried his mahout, or driver, behind his ears upon his neck. They moved at the pace which seemed for them only a smart walk, but so swift was their progress along the road that gentlemen mounted on horseback could only keep up with the carriage by making their horses gallop. The carriage had been built by a French coachmaker from Pondicherry, and was only remarkable for its dimensions, which were sufficient to contain ninety persons. A musnud, or elevated seat, like an ottoman, was placed in the centre, to be occupied by the rajah and his personal friends; seats were ranged round the margin with the faces inward, and the shape of the carriage was an oblong. They tell a story of a general, some of whose early days were spent in confinement at the fortress of Seringapatam, that on a visit to the rajah at Mysore, about the time of my sojourn here, he went out by invitation with the prince in this gigantic carriage: it was a royal pastime, and the rajah had given the hint to his servants to put the elephants to their quickest pace; but the effect of the velocity was such upon the nerves of the old warrior, that he implored the interposition of his highness to stop the carriage, or let him out. What would the old man have done in a railway steam-coach? I visited the stables of this prince: the most attractive object to my mind was an ass from the jungles of Persia, a present from the ruler of that country to the rajah. It was truly a noble animal, symmetrical, and of cream-coloured whiteness, so high of blood and spirit that he required two keepers in constant attendance; he stood fourteen hands high, the size of a common Arab horse. If the asses on which the judges and rulers of ancient Israel used to ride when they went forth out of their gates were of this species, their appearance and attitude would be quite corresponding with their station: this, too, reminds us how much the animal creation has deteriorated under the cruel and unwise usage of passionate and oppressive man. The society and intercourse at the residency was not always subject to the forms and trammels of ceremony and state. The first hour of dinner was usually enlivened, at least attended, by the music of the residency band, which had been trained to play some European pieces with great taste. Irish melodies were no strangers among their performances; Erin go Bragh was the signet in most frequent use: but these strains were soon superseded by general conversation, and local or national anecdote and story. Whatever was Irish was relished, yet not so as to offend other peculiarities. As a great rarity in those far eastern climes, the butler was one day ordered to bring from his store a bottle of Irish whisky. The cork was drawn, and the bottle and a liqueur-glass sent round the party. Each one sipped, and, as they tasted, recalled memorials or associated fancies with their father-land, the Emerald Isle: all praised and rejoiced that they had once more been brought into such proximity with the produce of their native country. The bottle, however, came a second time to the host, and he seemed to have some doubts: his confidence was shaken. He called the servant, examined whence the bottle had been taken, and it was well ascertained that the Irish whisky was nothing more than country arrack, but, perhaps, just as good for the country; and

the less taken of either the better for the constitution. The conversation had turned to the reputation for wit and drollery of the Irish peasantry, when it was mentioned as a good story, and quite a pardonable blunder in an Irish soldier, who had been ordered to compare the time-piece with the sun-dial, and to settle the matter with his master, had raised the dial from its pedestal, and brought it into the room that both might be compared together. On another occasion a party of natives approached the residency, carrying some sacred or important deposit. They laid down before the company a snake taken in the jungles, more than six feet in length, and as thick as a man's thigh. It was a monster-specimen of jungle snakes, and attracted the curiosity of all present. The natives offered it for sale; but either none were inclined to purchase, or no one would pay so much as the captors had expected, and they deliberately lifted the somnolent but loathsome reptile, and conveyed it back to the jungles: such is their horror of destroying a serpent's life, and their veneration for that deified brute—whose shape is an emblem of many mysteries in their religion—that they will suffer the most noxious serpents to escape, though they do not scruple to place them at the mercy of European travellers."

High up in the province of Wynaad there is an English hill fort, and we are told:—

"The situation of Manantoddy is solitary to the two or three officers whose duty requires continued residence. But to one disposed to converse with nature, or to study natural history, to gaze upon and explore the monumental antiquities of creation, or the fragments of remote convulsions, such a station must prove more attractive than the ruins of civic greatness, or the mounds and strongholds cast up by warrior conflict. I was received by the officer in command with prompt and cordial hospitality, and spent a short time under his bungalow-roof with great pleasure. He has since given to the world, in two lively volumes, the notes and reminiscences of a thirty years' residence in eastern countries. Major B—— was then a keen sportsman, and was sometimes drawn into the jungle further than a sober consideration for his own safety would have warranted. He shewed me the tusks of a boar which he had encountered and killed, but which had nearly overpowered and rendered him a martyr to the wild sports of the East. The ferocious beast had turned on his assailant, and attempted to gore him in the stomach. Major B—— was only saved by a strong belt which he had girt round his loins. The tusks of the boar passed through and rent his other clothes, and partially tore, but did not penetrate, the belt. The combat was short and critical, but ended in my host's triumph. Birds of every plumage fluttered and dwelt around, giving animation to the solitudes of the forest. The peacock was here in flocks, and supplied the table with a constant dish. Game was abundant. Elephants roamed on the contiguous mountains; their tracks, where they had made paths for themselves, were visible from the door of the bungalows. Among the phenomena of animated nature, a rare species of a kind of monkey-sloth was caught by one of my friends here. The natives of the country appeared never to have seen such a little man of the woods. The creature was discovered, with one of its young, to appearance almost tame, and inclined to become domesticated; so much so that they were allowed to move about without restraint. The parent might be about ten or twelve inches in height, and the young one

about eight inches. They walked upright on their hind-legs, and, besides their erect form, had much the appearance of human beings; the countenance of the old one being like the face of an elderly female. For some time the parent seemed fond and attentive to its young one; they both fed without any reluctance. Latterly, however, the elder animal became morose and reserved, refused food for a day or two, and excited fears of its approaching end. My friend was, however, surprised shortly afterwards to discover the body of the young one beheaded, and the trunk left carelessly by the mother. So far as could be traced, the parent had committed infanticide; and what added to the wonder, the little murderer seemed afterward quite relieved of its melancholy, and was inclined to indulge its appetite as before. I am not naturalist enough to determine the rank in the animal tribes which such a monster should occupy. My friend was persuaded by an officer of superior rank to give to him the survivor, to enrich his museum. I hope Major W—— was able to preserve the creature alive, or, at least, to bring her bones and hairy skin to Europe, and to determine, either by his own observation, or the assistance of some friend, to what species this inhuman murderer belonged. If so, I do not fear that the matter is lost to science."

From these brief examples a slight idea may be formed of Mr. Massie's work, which contains much of interest on many Indian subjects.

*The Tower of London, an Historical Romance.*

By W. Harrison Ainsworth. Illustrated by George Cruikshank. Part I. 8vo. pp. 32. London, 1840. Bentley.

THE very cover prejudices us in favour of this work, and we go to the *Tower* in spite of its armed guardians, with great expectations of enjoyment to the eye and mind. And as far as we can judge from a first specimen, neither are we likely to meet with disappointment. Three engravings on steel (besides woodcuts) in every Part, would lug the shillings out of the pocket of the veriest miser that ever existed: John Elwes himself would have bought a considerable number of copies as an agreeable solace and safe speculation. Queen Jane Grey's entrance into the Tower with all the pomp gathered round her by the arrogant Northumberland; her nightly vision of the axe in St. John's Chapel; and, far above them both, the scene in the Stone Kitchen with the illegitimate giant race of Harry Tudor, Og, Gog, and Magog (we wonder such great men did not in these days of disputed succession aspire to the crown—a triple crown, like the pope's, it should have been for such a triumvirate), and their faithful follower, the dwarf Xit, together with other characters belonging to the historical romance, are a perfect treasury of embellishment. Then come we to the text, which opens with much spirit and interest. The royal procession on the Thames from Durham House to the Tower is most graphic in description; the characters and incidents which prepare us for the fictitious portion of the tale are happily conceived; and the historical events, such as the meeting of the privy council, with the plots and counterplots therein involved, are related with so perfect an air of reality and truth that you feel as if an eye and ear-witness were telling you what happened and what he saw done. It is in this kind of moving panorama of life that the author's main strength lies. Nothing can be more stirring than his narrative, and if he can only carry on to the end of his thirteen announced Parts, a story or

stories of this kind without much flagging, he will have accomplished a performance not to be excelled by many, if by any, of its class in our national literature, and well worthy to be the companion of Cruikshank's inimitable conceptions and representations of the olden times. To say more at present would be superfluous: we have simply to do, as we have done, brief justice to the *début* of *The Tower of London*, laden as it is with vivid and extraordinary memories.

*Austria.* By Peter Evan Turnbull, Esq. F.R.S. F.S.A. 2 vols. 8vo. London, 1840. Murray.

WE last week traversed, in other company, another portion of the Austrian Empire; and as it is not easy to have too much authentic information respecting a country so important, we now, with pleasure, address ourselves to a notice of the volumes before us, though we must, at the same time, confess that our review takes up its least weighty matter and leaves the most weighty altogether untouched. The truth is, that the first volume consists of the personal travels of the author through Bohemia, Styria, and Upper Austria, his stay at several famous watering-places and Vienna, and his retreat *via* Trieste, with a trip into Iatria, with which we can sufficiently cope; but the second volume contains elaborate disquisitions on the social and political condition of Austria, her principles of government, finances, trade, laws of property, landed tenures, religion, education, jurisprudence, police, army, and policy foreign and domestic, each one of which to be handled properly would require one of our Literary sheets,—and our readers, being well aware that we cannot afford so much space, will excuse us for referring those whom it may concern to Mr. Turnbull's treatment of these interesting subjects. Turning, therefore, to his first *volume*, we halt at Carlsbad; though, in truth, many of his statements and remarks about this and similar places of resort have been anticipated by Dr. Granville and other writers. The mention, however, induces some observations on Poland which deserve extract:—

"A kind of second season commences at Carlsbad in the beginning of September, and is sometimes prolonged till the middle of October; at which time the cold, damp air of the valley causes physicians and patients alike to take their departure. It is in this second season that the Poles (such as can obtain the requisite passports) principally resort to the waters, and form there a society among themselves. In this particular year, the disinclination of very many among them to congregate in a place wherein a Russian Grand Duke was the principal personage, may have formed an especial motive for the lateness of their arrival: but it has usually occurred that pecuniary circumstances, the want of credit for loans, and the necessity of selling or engaging a portion of the agricultural produce of the year, in order to raise the means for travelling, have formed a necessary impediment to their earlier movements. Were it not for the disadvantage of climate, no season would probably be so agreeable at Carlsbad as that wherein the families of this unfortunate nation form its principal society. Whatever be their political faults and follies, and however fatal to themselves and their country may have been the corrupt intrigues of the chiefs, and the factious, concocted turbulence of the subordinates, no people, perhaps, so happily combine as the superior class of the Poles that cultivation of mind, and that sort of ingenuous frankness of character,

which constitute together the principal charm of social life. A few of them there were among the visitants even during our sojourn at the baths; and among these were some of our most agreeable, I may say, most delightful associates. Poland, their dearly cherished country, would be a frequent theme of their conversation; but, while they grieved for its sad degradation, the wiser among them would admit the internal vices and corruptions by which that degradation was occasioned. From their communications I am led to the opinion, that in Prussian Poland much individual liberty is enjoyed; the public administration wise and impartial; and the condition of the country flourishing and improving; but the taxation is heavy. In Galicia, that portion of the Polish spoils which has fallen to the Austrian sceptre, the condition of the people is very inferior. The taxation is felt to be oppressive; as the principal element of Austrian finance, the land-tax, is now extended equally to it as to the other provinces of the empire, and is made to bear alike on the nobles and on the peasants. It is complained of, consequently, as a galling impost, by a poor and thriftless nobility, whose lands under the old Polish aristocracy were wholly exempt from charge; while, on the other hand, as the government has not ventured to adopt more than very gradual improvements for the abatement of feudalism, there is less encouragement to industry than in the more anciently annexed districts, and hence the non-noble classes are poor and discontented. In the Russian portion, which does, or did, constitute the kingdom of Poland under a viceroy from St. Petersburg, there is no individual liberty or political right;\* but the taxation is easy, and the general condition is again beginning to thrive. Before the late revolution, it was pre-eminently prosperous. Agriculture and manufactures had improved most rapidly; and, for elegance and luxury, Warsaw was scarcely inferior to any city in Europe. All this public welfare was blasted for a time by the internal war. The superior classes were involved in ruin, and their inferiors necessarily partook of the general misery; while the government, now rendered suspicious and distrustful, became arbitrary, oppressive, and vexatious."

The operations of the celebrated minister, Prince Metternich, on his estates near Marienbad, also tempt us to select the account of them:—

"The largest proprietor in this part of Bohemia is the Prince de Metternich; and his château of Königswart, distant a few miles from Marienbad, has a rich store of interest for the curious visitor. Here are collected a variety of remarkable objects connected with local and general history; and, in the formation of museums illustrative of the arts and the mineralogy of the country, the prince has conferred a useful service to science: but it is on higher grounds than these that the value of this eminent statesman, as a large and influential landlord, must be regarded and appreciated. On his Bohemian estates, which have of late years been augmented by very extensive purchases, he has established experimental farms. He

has introduced from other lands a better system of agriculture and of rural economy. He has erected villages, established schools, and, exerting the powers of his wealth, his influence, and his intellect, for the improvement primarily of his own land and of the cultivators on it, he is contributing secondarily, but most importantly, to the benefit of the kingdom at large. Among the peculiar characteristics of this highly-gifted statesman, none are more striking than the facility with which his mind can discriminate the smallest details, while grasping the mightiest objects; and that quick perception and commanding decision of character, which render him almost a man of leisure, while personally directing the whole government of the empire. He is never hurried nor embarrassed. From the cabinet of state at Vienna he can give directions for the management of his farm-yard in Bohemia; and, after dictating those instructions on which depends the policy of Austria in every country of Europe, he can find time to pass hours together in familiar conversation with the passing stranger, whose introductions may have rendered him the object of his notice."

At Teplitz our countryman had an opportunity of seeing the exiled Royalty of France, and their abode; and, especially as he tells us something of the Duc de Bordeaux, at present exciting more than usual public attention, we shall copy out some of his description:—

"In answer to the inquiries which I addressed in the proper quarter, it was now communicated to me that the royal family would return on a certain day from Teplitz; not indeed to Prague, but to the château of Puschtiérad (about thirteen English miles from that city), which they had taken as a country residence; and where, in order to cause me as little detention as possible, they would receive my visit on the morning after their arrival. Puschtiérad is a valuable domain belonging to the Grand Duke of Tuscany, but its value consists in the abundance of its products, not in its natural beauty or artificial decoration. The country around is cheerless and bare of trees. The rude shrubberies immediately near it can hardly be dignified with the name of pleasure-grounds; and the château itself is a large long building of two stories in height, generally of one room only in depth, with all the windows fronting the north, and the doors opening into corridors which on the southern side run along the whole extent of the façade. On arriving there, I found on the doors of each room along the corridors, except those immediately occupied by the royal personages, cards affixed with the names of their respective tenants. No attendant appeared about the passages, or the rooms within, or the courts without—all was still and silent, and gave the idea of a monastery rather than a palace. In this gloomy and cheerless dwelling, which seemed to harmonise too faithfully with the fortunes of its present inhabitants, were now assembled the old King Charles X., the Duke and Duchess d'Angoulême, Mademoiselle, and the Duke de Bordeaux; together with a few attached adherents, who still followed the fortunes, and formed the little court, of him whom they regarded as their lawful sovereign. The Cardinal de Latil had lately taken his departure for Rome. The Baron de Damas and the Duchess de Gontaut who had directed the education of the prince and princess, had been compelled by circumstances of a peculiar and painful nature to quit their charge, and had retired into France. Some others who were properly members of the establishment were

absent in other parts; and those now at Puschtiérad were the Duke de Blacas, the Duke de Polignac, the Count O'Hegerty, the Abbé Fraissinous, M. de Barante, the Countess d'Agoult, and one or two other ladies in attendance on the Duchess d'Angoulême and Mademoiselle. My first visit was to the young duke, who was now in his fifteenth year. When I had seen him at Paris, and afterwards immediately on his arrival at Lulworth, he was of slim and delicate form, full of vivacity, but, in appearance at least, of rather doubtful health. I now found him a fine, stout, healthy youth, with the Bourbon features strongly marked, and a clear ruddy complexion. He was by no means tall for his age; but his figure was broad and thick-set, and gave indications that, in this respect, he would rather resemble his father than his grandfather. On his intellectual powers, our interview was too short and too constrained to allow me to form any accurate judgment; for that frank and free communication which I might have expected under the high authority of M. de Damas, was not permitted by the gentleman now acting as his tutor, who remained by his side during the whole of my visit, and to whom I was personally a perfect stranger. The young prince expressed pleasure at seeing me, although it is not very probable that at his age he would have remembered, with any distinctness, the smaller circumstances which had occurred several years before; but it appeared to me, from some indications, that he felt a painful consciousness of the change of his condition, and of the altered circumstances under which he was now placed.\* Be this as it may, the tutor seemed decidedly desirous to repress rather than to encourage his observations, by interfering to assume the conversation to himself; and thus leaving me little more than the opportunity of forming a general opinion, that he was altogether a fine and promising boy. In the Duchess d'Angoulême, to whose apartments I next proceeded, I saw little change. She was suffering from a severe cold, but otherwise her health was good; and to say that her general tone was melancholy and dejected is only to say that she was, in the exile of Puschtiérad, what she had been in her brightest hours at Paris. She spoke much of her nephew, of his clearness of intellect, and his close application to his studies—but without the expression of any sanguine expectations of the future; and, indeed, the sad retrospect of her own past life would afford little encouragement for the illusions of hope.

"Strongly contrasted with the appearance and demeanour of this unhappy princess, were those of the aged monarch. I was introduced into his apartment by the Duke de Blacas, and was honoured with a very long and agreeable interview. His tall thin figure looked even more lank than in former days, owing to the long brown frock, or rather great coat, in which he was arrayed, which closed tight round his slender form, and descended to his heels. He stooped much, but otherwise, although now in his seventy-eighth year, he

\* "We were acquainted at Carlsbad with a Polish gentleman, whom we hope some day to visit at his château in Volhynia. The territorial arrangements of the Congress of Vienna had rendered him a Russian subject, and his brother a Prussian. The latter had free liberty of locomotion; but our friend had been for years applying for a passport to come to Carlsbad; the refusal having been usually accompanied with the intimation that, if he required warm springs for the recovery of his health, he might repair to the Caucasus, where such were to be found!"

\* "During the residence at Edinburgh, he accompanied the Baron de Damas in a tour through some parts of Scotland, visiting, as ordinary travellers, the various objects of interest. At some noble mansion, I think at Taymouth, a book was laid before them, ruled with two columns, in the first of which strangers were requested to write their names, and in the second their stations or professions. The Prince wrote only 'Henri de Bourbon.' The Baron, in joke, said he ought to fill up the other column. He took up the pen and immediately added the word 'Vagabond.'"

showed little marks of age, and his countenance and manner were lively and animated. Charles X. was still, as he had ever been, a fine specimen of the old French gentleman—kind and familiar in his address, polished but easy in his manner, and gay in the midst of adversity. With him was neither restraint nor melancholy; and as he chatted familiarly of France, and Spain, and England, of the events of his own past life, and of the fortunes which he trusted might hereafter beam upon his house, I am willing to hope that he may have derived a momentary satisfaction from the visit of disinterested respect thus paid to him by one who, however comparatively lowly in station, and however discordant from him in many important points of opinion, still retained a grateful remembrance of the kindnesses and hospitalities received within the walls of his palace during the days of his royal domination. The French volatility with which he passed rapidly from subject to subject, was sometimes tempered with a feeling, not mournful but pensive, with which he alluded to his own advanced age, and the doubtful expectations he entertained (for he seemed not wholly bereft of hope) of another restoration for himself. His anticipations in favour of his grandson were expressed in more sanguine terms. He spoke of him with much affection; and said that the great object of himself and his family was to render the young prince worthy of any destinies that might await him. His favourable reception in England, and the attentions shewn to him in Scotland, were subjects on which he evidently liked to enlarge, for he resorted to them more than once. He was full of anecdote as to the events of his residence at Holyrood, in the first emigration, and some of them were singular enough: but the circumstances on which he dwelt with most evident satisfaction were those of his favourable reception at Poole and other parts of Dorsetshire, on his last arrival from France; in all of which he had been made to apprehend that he would have met with insult and outrage."

The poor banished court was hotly divided into two parties of the question, whether the abdication of the king in favour of the Duc de Bordeaux was complete and perpetual, or otherwise: it was of little matter *then*, and is of less *now*; but we close the details of this visit:—

"Charles is numbered with the dead. The Duke d'Angoulême has long since ceased to be of any political or even personal importance. Somewhat of greater interest may attach to the Duke of Bordeaux—and I regret my inability to form correct ideas of the influence which circumstances may have had in the formation of his character. At Paris his education, under the government of M. de Damas, was in my opinion ably and judiciously directed.\* M. de Damas remained with his royal charge during the residence at Lulworth and Edinburgh, and for some time afterwards at Prague. On his resignation, the post was accepted by the Marquis de Latour Maubourg, a high and distinguished officer and excellent man; but he held it only for a few months. M. de

Chateaubriand next arrived at Prague with a view of succeeding to the vacant post, but, upon ascertaining its nature on the spot, he, as was understood, declined to act; and M. de Saint Chamas, the nominal governor when we were at Puschierad, was then absent, and it was very doubtful if he would return. Of the real circumstances attendant on these repeated changes, I received no certain information, and am unwilling to offer my own conjectures. I know that the high feeling of the Baron de Damas struggled long against great opposing difficulties (whatsoever those difficulties might be), before he would admit to himself the necessity of his withdrawal from duties which, with satisfaction to himself, he could not perform; and, from the manner in which the Duchess d'Angoulême spoke to me of him, I rejoice at any rate that he still retains the respectful esteem of those who may have long reason to lament his departure. I greatly fear that a system of education may have been insisted on, too confined and monastic in character to meet the views of those able men who would have wished to train him in a different manner. At Prague, which was, until the death of Charles, the usual residence of the family, they kept up courtly etiquettes which were cumbrous to themselves, and disagreeable to the noble Bohemian residents, who thus abstained, with one or two exceptions, from visiting at the palace. They lived in a strict retirement, of which the Duke de Bordeaux was the victim. Royal and religious usages prevented his intermixing in society with those who might enlarge his mind; and for him to enter into the common amusements of the world, would, as it was told, have been deemed an impropriety. He rode on horseback daily with Count O'Hegerty; but he had no young companions; none of those social excitements which are proper to the season of youth; and which sharpen the intellect, excite the animal spirits, and give tone and vigour to the character. Many considerations were alleged as palliations for this system of seclusion; and among others was one of a painful nature—the justly founded fear of attempts at assassination; but, as the prince has now advanced toward manhood, it may be hoped and believed, that, before it were too late, he will have been thrown more into the world around him, and have received a fuller development of those talents which, judging from what I knew of him in earlier years, I believe him to possess."

Altogether the condition of the Austrian people is contented and happy, and the government is administered throughout in a parental manner. Patriarchal rule is nowhere on earth so widely extended over a vast region and a numerous population. But we must leave these points to the political reviewer, and just dip into the library at Vienna as more consistent with our plan and purposes. Among the rarer treasures stored up here, Mr. Turnbull mentions:—

"'Psalmorum Liber' Fust and Schoeffer de Gernshelm. Mayence, 1457. Folio, on vellum, with very large gothic characters, about a third of an inch in length. This is the earliest book printed with an inch. \* \* \* 'The Fifth Decad of Livy.' A handsome MS. in un-

cial letters, well preserved and clearly written. It is unique, and from it alone has the Fifth Decad been printed. Original Manuscripts of Tasso's 'Gierusalemme,' full of alterations and corrections. 'Tabule Peutingerianæ.' This (says our author) was to me the most interesting object of the whole collection; for, although facsimiles of it have long ago been published in the works of Montfaucon and others, still there is a peculiar satisfaction in viewing the original of remarkable objects. It is a Roman geographical military map on vellum, made apparently in the time of Septimius Severus, in the fourth century, and copied out, as we now see it, in the thirteenth. It is about a foot broad, and of great length. In it appears to be comprised the whole of the Roman world, but so compressed (it being intended to serve merely as a road-guide for military movements) that the Mediterranean and Adriatic are made to run parallel to each other. All the towns and stations are marked with the distances in Roman miles between each. The first sheet of it, containing the westernmost part, being Spain and part of Britain, is wanting; but Professor Wittenbach, of Treves, has recently discovered a portion of it in the binding of an incunabulum of the library of that city."

At Grätz, the Archduke John more than emulates the example of Prince Metternich (already quoted) in his systematic and liberal exertions to improve the condition of the people:—

"The pride of Grätz and of Styria, the great intellectual resource for the inhabitants and for strangers, is the Johanneum; one of the most valuable establishments of the kind in Europe. It owes its origin to the Archduke John, from whose name it takes its appellation. In the year 1811, this enlightened and patriotic prince obtained from the Stände, or provincial parliament of Styria, the grant of a spacious public edifice for the formation of a national scientific and literary establishment, together with the vote of certain annual funds for its support; which grant was subsequently confirmed in perpetuity by an imperial charter. These primary arrangements having been completed, the archduke presented to it the whole of his own very extensive and valuable collections—of books, of natural history in its several branches, of antiquities, of industrial models and specimens, and of miscellaneous objects of interest. To these each year witnesses important additions, procured for the institution by the funds and the researches of its founder and patron. A munificent bequest from Count Brigido, in the year 1817, enabled the trustees to make large additions to the building, to which is now attached an extensive botanical garden; and the salaries of eminent professors, who give gratuitous courses of lectures on mineralogy and geology, botany, chemistry, agriculture, and the useful arts, are defrayed by the Stände. At the period of our arrival, the archduke happened to be himself at Grätz, having come over for a few days from his usual residence at Vordenberg, to preside at an agricultural meeting. We availed ourselves of this opportunity to present our introductions to his imperial highness, whose reception was most kind, and who, at a subsequent term, attended by Professor Anker, the learned custos of the museums, graciously conducted us himself over every part of the Johanneum: explaining the various objects as we went along, and conversing freely and most instructively on a variety of incidental topics. We first went through the rich collections of natural history, which in all its departments occupy thirteen rooms, some very spacious. The geological and mineralogical departments contain, first, complete and very interesting specimens of all the rocks and minerals of Styria; and, next, a rich general collection from all the other parts of the world. The specimens are mostly fine, and, as usual in Austria, admirably arranged for inspection and reference. In the zoological room were some specimens, stuffed and otherwise preserved, both native and foreign,

\* "Four hours of the forenoon, with breaks of a quarter of an hour each, were devoted to instruction in history, languages ancient and modern, arithmetic, and other matters, which, as far as possible, was conveyed by oral precept without the use of books; and, seated on a high chair at the table, with a broad black board before him, whereon were traced such delineations as would tend to elucidate the oral explanations, he often evinced an acuteness and precocity of mind and memory, which I should not have expected from a boy at his years. His various teachers were of course the most able that Paris

including some immense birds of the falco tribe killed in Styria, and an enormous bear, an animal which abounds in these regions. The botanical rooms contain a *hortus sicus* of more than fifteen thousand plants, in about a hundred large thick folio volumes; and also a hundred and forty volumes of trees, arranged in the manner of those in the monastery of Admont. Of one plant, the *Panicum sanguinalis*, hopes were expressed that it might be rendered a source of great public benefit; being capable of cultivation on the poorest soils, and bearing a grain from which nutritious bread could be made; but how far these hopes are likely to be realised, I have not of late had the opportunity of learning. Practical utility and improvement have been the objects always present in the mind of the archduke, in the primary foundation and endowments, as well as in the subsequent conduct, of the Johanneum. Accordingly, we find here in one part a complete collection of all the indigenous products of Styria, which can by labour be converted to the use of man; together with the same in their several prepared or manufactured forms. In another part we see united all agricultural and mechanical implements now used in Styria; and beside them specimens or models of the principal instruments and machines of all kinds adopted for similar purposes in foreign countries, from the examination and mutual comparison of which his imperial highness seeks to improve the native practice. One room is devoted to antiquities, among which is a pretty large number of Roman, and a good collection of Styrian and other modern coins, together with several Persian and Babylonian objects of high value, cylinders, amulets, rings, &c., many of them sent to the archduke by Mr. Rich and Sir Gore Ouseley. Near this room is a fire-proof apartment for the custody of records, in which all private families and municipal bodies may deposit their documents, or copies of them, for secure preservation, and which now form an interesting collection of local history and antiquities," &c. &c.

Might not nations which boast much, take a leaf out of this book by way of an example? But we have not space for further illustration, and far less for lecturing, and so take our leave of Austrian affairs, only observing that he gives some curious particulars of the *Proteus Anguinus*,\* which he found at the caverns of

\* He tells us, "Our three guides stationed themselves at various points, and, brandishing their large torches aloft, shewed well this solemn cavern, with its huge pillars and dark dull waters; rendered the more interesting to the fanciful mind, as being the habitation of that mysterious animal the *Proteus Anguinus*, which, except in one other spot, also in Carniola, near Sittich, has been found nowhere else. This creature appears to be bred in some much lower subterranean lake, and to be borne up into these comparatively upper regions when the waters swell. We were told that during a considerable part of the year there is no water whatever in the cave of the Magdalena. In the winter and spring it rises through crevices from below, and even then is the *Proteus* only occasionally discovered. It is found in the Poik (if the water to the right of the entrance be the Poik) in this cavern, but never in that of St. Catherine, nor in any other part of the river: neither is any other fish or living creature said to be found in the Poik after its first entrance below the earth. It is found also in the water which I have mentioned to the left of the entrance, supplied probably to them both from the same reservoir or river beneath. To this water on the left we partially descended, but the drippings had rendered the soil muddy and unsafe. One of the guides, however, stationed at the bottom with his torch and hand-net, endeavoured to capture two or three of the protei, but on his attempting to take them they escaped under the rock. On our return to the inn at Adelsberg, I saw some of these creatures alive in a decanter of water, where, by changing the water every day, and without any other food, they had lived (as they owner told us) more than a twelvemonth. They were about seven inches long, and perhaps half an inch, or somewhat less, in diameter; the form of body somewhat like an eel, but with four legs regularly jointed

Adelsberg, and also of his excursions to Fiume, Istria, &c., and inspection of the ruins of Pola.

*Hermesianactis Poeta Elegiaci Colophonii Fragmentum; Notis et Glossario et Versionibus, Lat. et Angl., instruxit Jacobus Bailey, A. M. e Coll. Trin. Cant. Appendicis loco subjunctum Archilochi ac Pratinæ Fragmenta duo, similiter instructa. Accedit Georgiesii Burgesii Epistola Critica. 8vo. pp. 176. London, 1839. Whittaker and Co.*

A BEAUTIFUL reprint of three Greek fragments by Hermesianax, Archilochus, and Pratinas, edited from the text of Dindorf. To those who are desirous of seeing what can be done in the way of annotating, explaining, emending, reviewing, translating, indexing, &c. &c., we recommend a glance at this volume, in which they will find a text of some 120 lines (i.e. in all the three fragments) supplied with critical apparatus, occupying nearly 200 pages! Great pains have evidently been taken with the book, and much credit it reflects on its learned editor; but as we also are nothing unless we be critical, we beg to say, that we cannot assent to all his assertions: *ex. gr.* at p. 25, on *δix* he says, "*vox lexicis adjicienda.*" Now, although it may be true enough that *δix* cannot be found in the ordinary school lexicons, yet if we look beyond these to such lexicons as may be supposed suitable for persons far enough advanced in Greek to read Hermesianax and his annotators, we shall find *δix*, in common with other instances of two prepositions compounded into one. We need only name Passow's "*Handwörterbuch der Griechischen Sprache*" (Leipzig, 1831), where *δix*, and all other similar compounds, may be seen. But there is one thought to which the book has given rise; were every fragmentary portion of ancient writing that has survived illustrated with the same fullness as these three fragments, *οὐδὲ ἀντὶς ὄμαι τὸν κόσμον χαρῆσαι τὰ γραφόμενα βιβλία* would cease to be hyperbole, and that without mankind being greatly benefited.

#### MISCELLANEOUS.

*Mrs. Loudon's Ladies' Flower Garden of Ornamental Annuals. No. XIII. London, 1840. Smith.*

THIS very beautiful, and consequently interesting publication, makes us like it better every successive number. The sweet and ele-

like quadrupeds; the two fore-feet having three toes, the two hinder two only; the legs about an inch long, and the hinder ones at a great distance from the fore; colour a grayish white; head very large, with a large broad mouth; two very small eyes; and behind the ears the gills of a fish. They have a double apparatus for breathing, and form a mixture or link of connexion between the fish and the quadruped. Doomed, apparently, to live in eternal darkness in the abyss of an Illyrian mountain (for their upheaving into the caves must be considered as an exception), it might seem strange that the creature should be provided with eyes. Some imaginative writers have deemed that they had formerly a higher locality, and that amid the various convulsions of the globe some retirement of the waters may have carried the relic of a nearly destroyed race to its present asylum. It may be more philosophical to suppose, that the small portion of light accompanying air through the crevices of the mountains, although imperceptible to our organs, may suffice to direct the course of these more delicate creatures. It is evident from the length of time that they have lived in the bottle, that the light and air of this upper world is not destructive of their vitality. Those which we saw were moving about with activity over each other, and climbing with a sort of reptile motion along the sides of the glass. Whether their propagation has been attempted in other places, I know not. Some were transported to the St. Catherine cave, and placed therein, mostly in the river, but partly also in small standing pools. Those in the former may still exist: the water is too deep and dark to allow the fact to be ascertained with certainty; but none have been seen or caught. Those in the pools have disappeared—stolen, it is supposed, by the strangers on Whitmonday."

gant blossoms which adorn this wintry fasciculus, are *Amethystea*, *Salvia*, *Entoca*, *Nemophila*, *Phacelia*, *Cerinthe*, *Echium*, and other charming varieties from several distant parts of the earth; now all collected together, to give every change of form and shade of colour to our English gardens.

*The Colonial Magazine, and Commercial-Maritime Journal.* Edited by R. Montgomery Martin. No. 1. London, 1840. Fisher and Co.

As we expected, this is a solid and able publication, which will be of infinite value both to the mother country, and to those wonderfully extensive colonies which are changing the face of the habitable globe, and carrying the English language and civilisation from pole to pole. The prodigious interest attached to the subject at the present era renders such a periodical peculiarly acceptable; and there can be no doubt of its great circulation, wherever the vast concerns involved render it expedient to have the best and latest information. Our existing position and future prospects, ancient and modern colonisation, our maritime and steam resources, Canada, the opium trade and its stoppage, reviews of new works, colonial intelligence, biography, &c. &c., are the contents of the opening number, and furnish much matter for grave consideration.

*The Maiden Monarch; or, Island Queen.* 2 vols. London, 1840. Hastings.

A SORT of political vision in which our young Queen is made a great reformer to the end that *redeunt Saturnia regna*, and we become the best and happiest people that never lived. Equal laws, all moral and religious, plenty to eat, plenty to drink, little work, and plenty of pleasure!

*Australia as she is, and as she may be.* By T. Potter Macqueen, Esq. Pp. 60. London, 1840. Cross; Simpkin and Marshall.

A PAMPHLET which unfolds the actual condition of this vast territory, and points out the means by which its rising destinies may be hastened and promoted. The vision presents us with another quarter of the earth as large as Europe, richly peopled and cultivated, and offering resources for millions of human beings yet unborn, for whom the old over-populous world could afford no refuge.

*Memoirs of the Life of Sir Walter Scott* (Vol. X.), which completes this popular edition, and is embellished with a view of the library at Abbotsford, rendered immortal as the scene of much of the living labours of Sir Walter Scott, and another of his burial-place in Dryburgh Abbey, round which a universal interest is shed.

*How to Rise in the Church*, by the Rev. John Crow. Pp. 24. (London, Wilson.)—A Radical pamphlet against clergymen of the Church of England, with such attacks as are rather rife in the democratic press of the day.

#### ARTS AND SCIENCES.

##### GEOLOGICAL SOCIETY.

DECEMBER 18th. The Rev. Dr. Buckland, President, in the chair.—A paper 'On the Fossil Remains of a Mammal, a Bird, and a Serpent, from the London Clay,' by Mr. Owen, was first read. Until a few months since, the highest organised animal remains known to exist in the London clay, were those of reptiles and fishes; but, during the last summer, there were discovered in the collections of Mr. W. Colchester, of Ipswich, and the Rev. Edward Moore, of Bealings, near Woodbridge, teeth of a quadrumanous animal, of cheiroptera, plantigrade and digitigrade carnivora, and of a species, probably, belonging to the marsupial order, all of which were obtained from the London clay of Suffolk.\* To this important

\* See Mr. Lyell and Mr. Owen's papers, "*Annals, Nat. Hist.*" November, 1839.

list, Mr. Owen is now enabled to add the remains of a new and extinct genus of pachydermatous mammals, of a bird, and a serpent. The first of these curious fossil relics was discovered in the cliffs of Studd Hill, near Herne Bay, by Mr. W. Richardson, and consists of a small mutilated cranium, about the size of that of a hare, containing the molar teeth of the upper jaw nearly perfect, and the sockets of the canines. The molares are seven in number on each side, and resemble more nearly those of the *Chæropotamus* than of any other known genus of existing and extinct mammalia. They present three strongly marked modifications of the grinding surface, increasing in complexity from before backwards. The first and second spurious molars have simple sub-compressed crowns, surmounted by a single, median, conical cusp with a small anterior and posterior tubercle at the outer side, and a ridge along the inner side of its base. They are separated by an interspace nearly equal to the antero-posterior diameter of the first molar, which is somewhat less than the second. The third and fourth false molars present a sudden increase of size and change of form. The plane of the crown is triangular, with the base outwards, and the posterior and inner side convex. It supports three principal cusps, two on the outer and one on the inner side; there are also two smaller elevations, with a depression on the summit of each, situated in the middle of the crown; the whole being surrounded with a ridge, which is developed into a small cusp at the anterior and external angle of the tooth. It is these teeth which form the principal difference between the dentition of the present genus and that of the *Chæropotamus*. The two molars are three in number on each side, and closely correspond in structure with those of the *Chæropotamus*. The sockets of the canines, or tusks, indicate that these teeth were relatively as large as in the peccari. Mr. Owen then describes the other portions of the head, preserved in the specimen; and he says the general form of the skull partakes of a character intermediate between that of the hog and the hyrax; but the large size of the eye must have given to the physiognomy of the living animal, a resemblance to that of the rodentia. Mr. Owen has adopted for this new extinct genus the name of *Hyatherium*, suggested by Mr. Richardson. The remains of fossil birds included in the second part of the paper, consist of two specimens, a sternum with other bones, and a sacrum, both obtained from the London clay at Sheppey. The sternum forms part of the collection of fossils made by the celebrated John Hunter, and is described in this memoir by permission of the Museum Committee of the College of Surgeons. The sacrum is in Mr. Bowerbank's rich cabinet of Sheppey fossils. The Hunterian specimen includes the sternum nearly entire, the proximal end of the coracoid bones, a dorsal vertebra, the distal end of the left femur, the proximal end of the corresponding tibia, and a few fragments of ribs. In approximating, in the first instance, to which of the three great primary groups of birds, aquatic, terrestrial, or aerial, the fossil can be referred, Mr. Owen shews, that the length of the sternum, and the remains of the primary intermuscular crest or keel, forbid its being placed among the struthions, or strictly terrestrial birds; but do not decidedly prove that the fossil must have belonged to a bird of flight, as the penguins and other brachyptera, have need of great muscular power to work the wing under water. In the present fossil, however, Mr. Owen proves from

the lateral extent and convexity of the sternal plate, the presence and course of the secondary intermuscular ridges, the commencement of the keel a little behind the anterior margin of the sternum, that the fossil has no affinity with the brachypterous family. The coracoid bones, or posterior clavicles, he also shews, are less available in this primary approximation, as they relate much more closely to the respiratory actions than to the movements of the wings, and are strongly developed even in the apterix. There remained consequently for comparison, the ordinary birds of flight, and of these our native species, which resemble the fossil in size, first claimed Mr. Owen's attention. Though the sternum is not complete, a sufficient portion is preserved to have enabled him to set aside the gallinaceous, and grallatorial, and passerine birds, which have deeply incised sternums, and thus to restrict the field of comparison to such species as have the sternum either entire or with shallow posterior emarginations. In this part of his paper, Mr. Owen enters into a minute investigation of those minor details and modifications, which are necessary to establish his inferences, yet cannot be abridged for our columns; but it may be stated, that after pursuing the comparison from the sea-gulls and other aquatic species upwards through the grallatorial and passerine orders, he at length found the greatest number of correspondences in the skeletons of the accipitrine species. The resemblance is not, however, sufficiently close to admit of the fossil being referred to any of the native genera of raptorial birds: and it is with the vultures that he has found the closest agreement. The fossil, however, indicates a smaller species than is known to exist at the present day, and belongs, probably, to a distinct subgenus. The professed ornithologist, Mr. Owen remarks, may receive, with reasonable reluctance, a determination of the family affinities of an ornithic fossil arrived at in the absence of the usual characters deduced from the beak and feet; but during the course of a long series of close comparisons he has met with so many more characters, both appreciable and available in the present problem than he anticipated, that he is emboldened confidently to expect, should more perfect specimens be found, that his present conclusion with respect to the Sheppey ornitholite will prove to be correct; and that it belongs to the group of accipitrine scavengers, so abundant in the warmer latitudes of the present world. Mr. Bowerbank's specimen consists of ten sacral vertebrae ankylosed together, as is usual in birds with a continuous keel-like, spinal ridge, and in five of which there is a resemblance to the corresponding part in vultures in the non-development of the inferior transverse processes. This character, however, Mr. Owen states, is not peculiar to the vulturidæ. Though the specimen does not admit of an extended inquiry, yet it presents no characters which affect the determination of the Hunterian ornitholite, but rather supports that conclusion. One of the specimens of the extinct species of serpent, described in this paper, forms likewise part of the collection of fossils left by John Hunter, and consists of about thirty vertebrae; the others, one of which presents a series of twenty-eight vertebrae, are in the cabinet of Mr. Bowerbank. The author considers that all the specimens are referable to the same species; and they were all obtained at Sheppey. The vertebrae belong to the dorsal or costal series, and are equal in size to those of a boa-constrictor ten feet long. They differ, however, from the vertebrae of

both boa and python in their superior length as compared with their breadth and height, the ridge continued from the anterior to the posterior oblique processes on each side is less developed; the oblique processes themselves do not extend so far outwards, and the spinous process is narrower in its antero-posterior extent but longer. In the two first of the above differences the fossil agrees with the Linnean coluber, and its subgenera, but differs from the crotalus, and in the remaining points it differs from crotalus, coluber, naja, and trigonophalus. The long and comparatively narrow spine, the outward prolongation of the upper angle of the posterior oblique processes, the uniform convexity of the costal protuberance, the uneven or finely wrinkled external surface of the superior arch of the vertebrae, are characters which distinguish these ophiidian vertebrae from those of any other genus of the order with which Mr. Owen has been able to compare it; and he, therefore, proposes to designate the fossil provisionally as *Paleoophis Toliapicus*. The ribs are hollow as in all land serpents. From the agreement in some points with the boa and pythons, and the absence of all those which might have prevented the living animal from entrapping its prey: and from the length which it may be inferred the creature attained, Mr. Owen concludes that the fossil was not provided with poison-fangs. Serpents of similar dimensions exist in the present day only in tropical regions, and their food consists of cold as well as of warm-blooded animals; he, therefore, in conclusion states, that had there been obtained no evidence of birds and mammals in the London clay, he would have felt persuaded that they must have coexisted with the *Paleoophis Toliapicus*.—A paper was likewise read 'On the Locality of the Hyatherium,' by W. Richardson, Esq. After alluding to the state in 1829 of the cliffs extending from Whitstable to Herne Bay, the changes which they have since undergone, and their present condition, Mr. Richardson proceeds to describe more particularly that portion called Studd Hill. In 1829 it, as well as the whole of the coast, consisted of a capping of diluvial matter, underlaid by a thick mass of a dark brown incoherent clay, abounding in septaria, selenite, marine organic remains, characteristic of the London clay and pyritous wood; since that period it has changed, not only by the extensive undermining of the cliff by the sea, but in its mineral constitution and organic contents. The incoherent brown clay has been removed and a dark blue stiff clay has been exposed, while the marine remains have gradually become so scarce that, in the autumn of this year Mr. Richardson found only a few crinoidal fragments. Terrestrial remains, however, have become so abundant, that he has obtained at different periods about 500 fossil cones, fruits, and seed vessels; and he adds, that they may be procured by bushels: fragments of pyritous wood also occur in so great quantities, that barge loads have been removed for economical purposes. These terrestrial remains exhibit no marks of having been drifted. Neither land nor fresh-water shells have been noticed. From the abundance of vegetables, and the knowledge that nature ever directs her means, as well in number as in fitness, to particular ends. Mr. Richardson inferred that remains, either of quadrupeds or birds, would be found in Studd Hill, and though his search was long: unsuccessful, it was rewarded in September last by the discovery of the *hyatherium*.

## PHYSICAL SOCIETY.

DECEMBER 14th. Mr. Gaselee in the chair. —Sir Anthony Carlisle read a paper, in which the means of reparation of animal structures were physiologically explained, and shewn to be strictly analogous to certain effects observable in inanimate nature, each being governed by the same physical laws. The author commenced by describing the structure of parasitical animals, shewing the gradual transition from the lowest to the more highly organised grades, and the corresponding presence or absence of tubular vessels; those more particularly described being *acephalocystis hydatidis*, *tænia*, and *fasciola hepatica*. A series of experiments were then exhibited, to demonstrate that the physical law under which arborescing fibres in vegetables, ramifying vessels in animal structures, and dendritic figures in minerals, are produced, is the same as that which operates in the highest orders of animal formation,—a conclusion to which the author had been conducted by observing the remarkable dendritic figures seen in the Mocha stone, and which are now imitated in the potteries under the name of Mocha ware, these figures being produced by touching the surface of common potter's clay, reduced by the addition of water to about the consistency of thick cream, with a pencil which has been previously dipped into a coloured fluid containing an essential oil, when very beautiful dendritic figures are instantly produced, in form and direction exactly corresponding to the ramifications of vegetable fibres, and tubular vessels in animal structures; the clay, indeed, presenting the appearance of minute injection. From these, and many other observations, Sir A. Carlisle had been induced to believe that the organisation of the effused matter which becomes poured out in cases of injury to, or loss of substance in, animal tissues, was governed by the same physical laws; that in each of the facts alluded to two agents existed, the one passive, whilst the other exerted an active agency: and that the effused matter in the case of wounds, and the potter's clay in the manufacture of the Mocha ware, were referable to the former, whilst the volatile colouring matter appertained to the latter; and which, indeed, was but an imitation of the manner in which blood sent to those parts becomes diffused, the same dispersive property being common to both fluids; whilst the same means which would be sufficient to destroy the dispersive property in the one would also be capable of effecting it in the other: thus the addition of a very small quantity of fatty matter would quite prevent the formation of the dendritic figures on the potter's clay, just, indeed, as the double revolutions of granules of camphor in water become arrested on allowing a drop of oil to fall upon the surface of the fluid in which they float; whilst, on the other hand, modern surgery had proved how much sooner the reparation of wounds in animal tissues might be obtained when, instead of the application of greasy dressing, simple water is employed. Numerous other illustrations were adduced, especially that of the incubated egg, in which the gradual formation of tubular vessels, and the consequent establishment of vascularity, could be accurately traced, all of which tended to support the position originally assumed by the author; and he then concluded by presenting the collection of specimens which had been exhibited, consisting of dendritic limestone, marble, preparations of animal and vegetable tubular vessels, diagrams, &c., to the museum of the hospital. The thanks of the Society were by acclamation given to Sir A. Carlisle

for his highly valuable communication, and the meeting adjourned until the present month, when the subject will be again introduced.

## ZOOLOGICAL SOCIETY.

At the usual monthly meeting, held on Thursday afternoon, very little business was done. The Report stated that upwards of 3000 persons visited the Gardens and Museum during December, and that 350*l.* 15*s.* 7*d.* was carried to the credit of the Society on the 1st of January.

## COMMITTEE OF THE BRITISH ASSOCIATION.

A MEETING of the General Local Committee of the British Association was held on the 7th of December, the Lord Provost in the chair. The meeting was numerously attended, and, amongst others, by Sir W. Hooker, Charles Forbes, Esq., Dr. James Watson (President of the Faculty of Physicians and Surgeons), Dr. Thomas Thomson, Dr. James Thomson, Dean of the Faculty of Procurators, G. Macintosh, Esq., L. Hill, Esq. of Barlanark, J. Alston, Esq. of Rosemount, W. Hussey, Esq., A. McLellan, Esq., A. Hastie, Esq., Captain Huish, Dr. Perry, Dr. J. Cooper, W. Hussey, jun. Esq., T. Edington, Esq., &c. &c.

The minutes of the former meeting were read by Mr. Strang; and Mr. Liddell detailed, as an encouraging circumstance, that out of the numerous Local Committee which had been appointed at the public meeting last week, only six or seven gentlemen had withdrawn; and the reasons given by five of those were, that their places of residence were out of Glasgow. At the same time, fourteen additional gentlemen had been enrolled, who had expressed their willingness to act.

Professor Nicol said, the first committee which he would propose was, perhaps, the most important of all; at all events, it was one without which they could not hope to carry out their arrangements with any reasonable degree of success—the Committee on Finance. It was hardly necessary to state this much, but, lest there might be any doubt on the subject, he would beg it to be understood that there was only one paid officer connected with the British Association. With the exception of Professor Phillips, the general secretary, every other gentleman gave his services gratuitously. The fund now to be raised, therefore, was simply to provide the means of proper reception for the learned men who might visit Glasgow on that occasion; and it would also be applied in fitting up the room, and providing the other necessary local arrangements. The fund was quite distinct from the other funds of the Association, which were realised from the annual subscriptions of the members, and were expended in the publication of their records, and in grants for the advancement of scientific purposes. Our fund, however (said the learned gentleman), will be applied to the furtherance of the local arrangements, and the nature of these will entirely depend upon the amount of the sum that will be raised. We anticipate that we shall be able to realise the sum of 2000*l.*; and, if so, it will enable us to effect our objects upon the most complete scale. Professor N. then read the names of the Finance Committee, which were unanimously approved of by the meeting. The other committees appointed were one to make the sectional arrangements, providing a large room for the evening meetings, suitable ordinaries, and also to take care that lodgings be provided for the strangers, and that they are put to no inconvenience or difficulty in this respect. Other questions

would also come before it; such as the best mode of arranging those lighter description of meetings which the ladies might attend, and which would partake of science and amusement. The next, the Committee on Models, was an important part in the business of the Association. At Newcastle and Birmingham many very interesting models were exhibited, and they proposed that here the exhibition will be as complete as possible. They might not be able to come up to Birmingham in this respect, but still expected a very large and important assortment. The learned Professor then said, The last committee which I will propose to be named is also a very important one, and it perhaps may be required to expend more actual trouble than any of the others—the Committee on the Museum to be formed of Minerals found in the West of Scotland. Attention to this important subject has always been recommended by the Association; and, at every place where it has met, large and important collections have been formed of the minerals of the district. We hope the collection at the Glasgow meeting will be an extremely interesting one, and we have reason to believe that many gentlemen in the city and neighbourhood are willing to lend us their services for this object. This committee was also agreed to. Thomas Edington, Esq. is Convener; William Murray, Esq. of Monkland, Sub-convener; and Dr. William Couper, Curator and Secretary.

Mr. Edington said that a museum had been for some time in progress at his own expense, and he had little doubt the collection to be brought before the meeting would be one of the most interesting and extensive which had ever been seen in Scotland.

It was agreed that three should be the quorum of each committee; and all of them have power to add to their number.

Mr. Liddell said, it should be understood that though Professor Nicol, Mr. Strang, and himself, had been appointed local secretaries by the British Association, if they were to continue, it would be necessary that they should be now sanctioned.

The appointment was sanctioned most cordially, and these gentlemen were empowered to act *ex-officio* as secretaries of all the committees. It was explained that the Common Hall in the College would in all likelihood be recommended for the geological section; and a room better qualified for the purpose could not be conceived, as it would afford sitting-room for 1400 persons.

Mr. Liddell said, We will be able to get apartments for every thing within the walls of the College, and accommodation of this description has never been obtained before. All we want is a large room for the evening meetings.

Mr. Strang read the names of several distinguished foreigners whom it was proposed to invite. In all there were one hundred and ten. It was resolved that the letters to these learned gentlemen should be sent through the foreign office to the different embassies. On the proposition of the Lord Provost, Lord Brougham was added to the Honorary Committee, in the hope of inducing his lordship to attend the meeting. After requiring the various committees to meet and report from time to time, the meeting adjourned.—*From the Glasgow Herald.*

## NEW PUBLICATIONS.

*Transactions of the Royal Medico-Botanical Society of London.* Vol. I. Part 4. Edited by W. H. Judd, Esq. Senior Secretary. CONVINCED, as every man must be, that many of the various plants, fruits, and flowers

so lavishly scattered by the hand of Nature beside our summer path, have their utility as well as beauty, we were among the first to hail the formation of the Medico-Botanical Society. The object of this Society is to cultivate and experimentalise upon all those plants to which any medicinal properties have been attributed, whether in times past or present; and the result has been most favourable to the cause of medical science. The contents of the present part consist of papers on the Piper Cubeba; Extractum Cubebæ; Sarsaparilla; Aconitum Ferox of India; Opium; Essential Oil of Turpentine; Cuichunchulli; Chimaphila corymbosa; Halowa amyris Ambrosiaca; Ulmus campestris; Fucus amylaceus; the species of Ionidium which produces the Cuichunchulli, &c., from the pens of W. H. Judd, Esq.; John Toller; M. A. Richard; J. Pelletier; Mr. John Foote; Sir Robert Ker Porter; Drs. Haneock, Sigmond, O'Shaughnessy, and Farre. The volume, which is neatly printed, contains a good lithograph of the Ionidium parviflorum Cuichunchulli, and does credit to the gentleman by whose zeal it has been edited, not less than to the Society under whose auspices it has been published.

#### LITERARY AND LEARNED. MERCHANTS' MARKS.

AT the first meeting for the season of the *Hull Literary and Philosophical Society*, a short time since, the President, Mr. Charles Frost, F.S.A., read an interesting paper on an antiquarian subject, which does not seem to have hitherto received the attention it merits, especially in a mercantile country like ours, and which was peculiarly appropriate to a town like Hull, which (as we see from this) so advantageously combines calm intellectual with busy commercial pursuits. On the subject of *Merchants' Marks*, Mr. Frost referred to some previous observations by Mr. Samuel Woodward, and then stated his own views in the essay he was about to read as follows:—

"My object is to investigate the causes to which may be attributed the respect paid to merchants' marks during the fourteenth, fifteenth, and sixteenth centuries, when they were considered to be of sufficient importance to be worthy of a place not only in the fronts of houses, but in painted glass, upon tombstones, and on monumental brasses."

In the middle ages, he observes, "in addition to their being common at this period, the historical facts connected with them, and the estimation in which they were held, render them worthy of more consideration than to be dismissed with the brief reflection that they once had existence. Mr. Jackson,\* after drawing a comparison between the merchants' marks of the middle ages and the ancient Runic monograms, from which he supposes them to have been derived, says, 'The English trader was accustomed to place his mark as his 'sign' in his shop-front in the same manner as the Spaniard did his monogram: if he was a wooldapler, he stamped it on his packs; or if a fish-curer, it was branded on the end of his casks. If he built himself a new house, his mark was frequently placed between his initials over the principal doorway, or over the fireplace of the hall; if he made a gift to a church or a chapel, his mark was emblazoned on the windows, beside the knight's or the nobleman's shield of arms; and, when he died, his mark was cut upon his tomb.' It is in reference to

the facts stated in the latter part of this extract that I have felt anxious to promote an inquiry into the history and application of merchants' marks, in the hope that it may lead to a satisfactory solution of some such queries as the following, which evidently arise out of the subject; viz. Were merchants' marks used exclusively for commercial purposes; or did they, under certain circumstances, become indicative of rank in the bearer? and, if the latter, were they used as substitutes for armorial bearings, or might they consistently be placed upon the same memorial with heraldic shields? But supposing that, under any circumstances, the mark of the merchant could be used in such a manner as to indicate his rank in society, or his importance in the commercial world, why, it may be asked, should not the printers' marks, which were equally exclusive, and which have given rise to much ingenious learning and speculation, and the marks adopted by various other traders, have been also recorded in testimony of the celebrity of those who had acquired good report in their immediate callings, in the exercise of which the use of peculiar symbols had become necessary? The latter question may at once be answered, so far as regards monumental records, if the observation of Mr. Dawson Turner, in his Introductory Essay prefixed to 'Cotman's Engravings of Sepulchral Brasses in Norfolk and Suffolk,' be correct. According to that antiquary, merchants or burgesses were probably the only class of laymen represented on monuments except the military. 'These,' says he, 'are chiefly to be found in borough towns or the parochial churches of large commercial counties, where the woollen manufacture flourished.' (Introduct. xxii.) It may be inferred that a similar preference prevailed in France, in favour of merchants and burgesses, in allowing their marks only to be represented in the painted windows of churches, where they were frequently placed, from the singular circumstance of the mark of Thielman Kerver, a printer in Paris, being omitted in a window given by him in 1525 to the Church of St. Bennett, which contains simply his initials on an escutcheon supported by unicorns, while the same initials are associated with his printers' mark, in a work printed by him on vellum in 1497, which Dr. Pegge, of antiquarian celebrity, ascribes to the circumstance of the mark relating merely to Kerver's trade. ('Gent. Mag.' vol. xxiv. p. 471.) In England the marks of merchants are yet frequently to be found, not only on tombstones, but on the stained glass of church windows, and occasionally along with heraldic bearings, in religious houses, as we learn from 'Pierce Ploughman's Creed,' where in the following description is given of a richly decorated window in a Dominican convent:—

'Wide windows y-wrought, y-written full thick,  
Shining with shapen shields, to shewen about,  
With Marks of Merchants y-meddled between;  
More than twenty and two, twice y-numbered;  
There is none herald that hath half swiche a roll.'

Ellis, in a note upon this passage, in his 'Early English Poets,' without expressing any doubt that by the association of these merchants' marks with the 'shapen shields,' it was intended to treat the former as ensigns of rank, still seems to consider that their introduction into such society was solely owing to the circumstance of those by whom they were assumed having no coats of arms."

"Shin mark," it appears, was synonymous with "merchants' mark;" and like these were the sort of armorial bearings of trade, sometimes in unison with actual monetary

armorial bearings, but oftener as distinct insignia. Mr. Frost adduces examples from ancient churches and buildings in Newcastle, Coventry, Hull, &c. &c. and adds, "The facts I have adduced must, I conceive, have fully established the position that merchants' marks were not merely employed for the convenience of trade, but that they acquired character, and became entitled to attention and respect, in proportion as those by whom they were adopted accumulated wealth, and obtained rank in society." Nor can we be surprised to find the prosperous merchant desirous of transmitting to future ages, along with his name, the device he had chosen to be associated with it, through good report and evil report, in his various commercial transactions. "They were probably," he concludes, "confined to merchants who traded with foreign countries, and were, most probably, derived from the Flemings." We have greatly abridged this curious inquiry from the "Hull Packet," and have only to notice a typographical error in the excellent account it gives of it,—where the date 1432 is printed for 1342.—*Ed. L. G.*

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

Monday.—Entomological, 8 P.M.; British Architects, 8 P.M.  
Tuesday.—Electrical, 8 P.M.  
Wednesday.—Society of Arts, 7½ P.M.; Geological, 8½ P.M.; London Institution, 7 P.M.; Medico-Botanical, 8 P.M.; Graphic, 8 P.M.; Literary Fund, 3 P.M.  
Thursday.—Royal, 8½ P.M.; Antiquaries, 8 P.M.; Royal Society of Literature, 4 P.M.  
Friday.—Astronomical, 8 P.M.  
Saturday.—Westminster Medical, 8 P.M.; Mathematical, 8 P.M.; Physical, 8 P.M.

#### ORIGINAL POETRY.

##### MISS LEE IN PANTOMIME.

[The following playful lines were the extemporaneous effusion of the late James Smith, and are given to the public (beyond the private circle where they were produced), not on account of their poetical merit, but simply as a sample of that ready humour with which he was in the habit of enlivening those friendly parties which enjoyed his society. The slight story is told in the verse just as it happened. Duverny wanted the assistance described, and was well pleased to procure it in the manner related from the good nature of a graceful actress, who had nothing to do with ballet action. One of the allusions points, we fancy, too directly to be mistaken, to a Lady who adorned the stage, and has since her elevation ever been the kind friend of the amiable and most deserving heroine of the poem, and thus locates it (as news-writers would say) not a hundred miles from Whitehall.]

I'll sing you a song,  
It won't take me long,  
The tune in my throat like glue sticks:  
A piece at New Drury  
Is running like fury,  
They call it *The Devil on Two Sticks*.

John Poole who wrote *Pry*,  
At rehearsal stood nigh  
The great female dancer from Paris,  
Who all hearts entangles,  
With a leg at right angles,  
And a high jump that never miscarries.

Quoth the Dancer to Poole,  
"By line and by rule,  
I'll grant you a power of attorney  
To find me a Girl,  
As fair as a pearl,  
To act with me, Madame Duverny."

Poole points to Miss Lee—  
"Then bring her to me"  
(Quoth Madame); "Quick hither conduct her:  
If she's willing to start  
In a pantomime part,  
I'm willing myself to instruct her."

\* Author of the late work on wood-engraving. (See *Literary Gazette*, No. 1199.)

Miss Lee is a girl  
Known to you and the Earl,  
As one who will do what she's bid-O ;  
So she pleases the Town  
In a black velvet gown,  
In the pantomime part of the Widow.  
Some folks move to music,  
And make me and you sick,—  
So awkward, they never grow better :  
We never *encore* 'em,  
But grace and decorum  
Attend on the fair Henrietta.  
Renowned Mr. Wieland  
Turns round on his heel, and  
In pantomime shrugs up his shoulders ;  
Lame Devil acts he :  
But pretty Miss Lee  
Plays the devil with the hearts of beholders !  
January 14th, 1837.

### BIOGRAPHY.

WILLIAM HILTON, ESQ. R.A.

THE apprehensions for some time felt by Mr. Hilton's friends in consequence of his declining health, have, we are much concerned to say, been but too fatally realised. He died on Monday last, the 30th of December, 1839, at the house of his brother-in-law, Peter De Wint, Esq., the able and well-known member of the Society of Painters in Water-colours. Mr. Hilton was, we believe, a native of Lincoln. In their youth, he and Mr. De Wint were placed with Mr. John Raphael Smith, the mezzotint engraver and crayon-painter (then residing in King Street, Covent Garden) ; a man, in every respect, of extraordinary talent, and admirably qualified to imbue a pupil with a true artist's feeling. Young Hilton also diligently attended the schools of the Royal Academy, studied anatomy, and rendered himself completely master of the human figure. The effect of all this preparation was abundantly manifest in his subsequent works, which were distinguished by their correctness as well as by their beauty. Of the numerous productions of his pencil, that which remains most strongly impressed on our memory was "The Triumphal Entry of the Duke of Wellington into Madrid." It was a most animated and charming performance, worthy of Rubens, of whose gorgeous and affluent style it instantly reminded the spectator. His "Comus," and his "Jupiter and Europa," were likewise remarkably fine compositions. Scriptural subjects, however, seemed to be Mr. Hilton's favourites. Perhaps his masterpiece in that department of the art was "The Angel Releasing Saint Peter from Prison ;" and it did little credit to the taste, judgment, piety,—ay, we will add justice and gratitude, of the country, that, although it was admired by every body who saw it, this noble and powerful picture, at the close of the exhibition of which it was the greatest ornament, instead of being transferred to the altar of one of our cathedrals, or to the gallery of one of our noble or opulent connoisseurs, was allowed to return to the artist's own studio !

Mr. Hilton, who had previously been made an Associate, and a Royal Academician, succeeded Mr. Fuseli as the Keeper of the Royal Academy. One of the principal duties of the keeper is to superintend and direct the students in what is called the Antique Academy ; and so satisfactorily did Mr. Hilton perform the functions of his office, that, about four years ago, the students subscribed for a handsome piece of plate, and presented it to him as a mark of their respect and affection. Indeed

no man could be more amiable or more honourable. There was an expression in his pale and pensive countenance which always struck us as peculiarly interesting. At the time of his death he was only fifty-three years of age. With his highly-gifted and highly-cultivated mind, what might he not have done, had he been blessed with good health, and had his life been prolonged to the average period of human existence !

### SKETCHES.

#### CHRISTMAS REVELS.

"*Sicut letud festum meritis is for to make.*"

Old MS. *Reliquie Antiquae.*

A TASTE for the revival of ancient sports and pastimes seems to be making progress throughout the country. For years the admiration of the Tudor style of architecture, so admirably recommended by the publications and practice of the late Mr. Thomas Hunt ; and of the conventional style in public edifices, so beautifully exemplified in the Blind Asylum, St. George's Fields, the design of Mr. Newman ; the adoption of antique furniture of various ages ; and, more recently, the spirited and magnificent resuscitation of the almost forgotten Tournament, have all borne testimony to the fact that the renewal of ancestral habits and customs is gratifying to the human mind, and pleasing to the imagination. These remarks are drawn from us in consequence of having witnessed, on Monday last, a Christmas Revel after the good old fashion, at the Prior's Bank, the mansion of Messrs. Baylis and Whitmore, on the banks of the Thames, at Fulham. The house, with its gorgeous Gothic suites of rooms and baronial-looking gallery, is just the place for such a scene. Its rich oaken rooms, splendid armory, and appurtenances and ornaments of every kind, reminded the spectator of those abodes which are described as the seats of similar festivities long centuries ago, and imparted a reality and zest to the sports which must have been lost in any modern residence. The gallery to which we have alluded was fitted up as a theatre, and a genuine holyday masque was performed to the great entertainment of an audience of some two hundred friends. In this figured appropriately ; Father Thames ; Jacky Frost ; Egomet, an elfin spirit ; and Thaw, the opponent of Frost. The burlesque was most amusingly kept up, and all the scenic accessories were fitly ludicrous. Another short masque followed, in which the parts were assigned to a Comus, a Motley, an Astrologer, a Paul Pry, one of the Children of Israel, and a Friar of Orders Gray. This being read was not so effective as the first, but the fun of a mock tournament, which closed the stage affairs, made ample amends for every deficiency in the court of laughter. Knights on wicker warsteeds, dames of most elaborate ruffles and embroidery, giants, giantesses, dwarfs, and other mummers, made up as merry a pastime as Old Christmas ever saw. Soon after it was finished, the brave boar's head and magnanimous party were marched in grand procession to the supper-room, followed by old Father Christmas, admirably dressed, and attended by servitors, heralds, and musicians, in ancient costume. The old Oxford glee of

"The boar's head in hand bear I  
Decked with bays and rosemary,"

which we understand was arranged for this occasion by Lady Whitmore, was most delightfully sung by her ladyship, the Honourable Mrs. Stopford, Mrs. Nugent, and Miss Whitmore ; and the repeat partook

of all the festive enjoyments of the season. Song and dance concluded the whole, the latter being much enlivened by the makers in their quaint garbs, and by the mixture of other fancy characters in splendid dresses of other days—as when the bluff Henry, his potent daughter, or the gay Charles the Second, led off the brawls ; or in masquerade disguises of our own period. Among the most conspicuous revellers we recognised not a few grave signors of the Antiquarian Society ; but, in truth, every body present entered fully into the spirit of the party, contributed to and enjoyed the restoration of pastimes not unworthy of Old England's hospitable and merrie times. Benevolence, too, threw her charm into the cup, and the printed bills, masques, &c. though sold at low prices, produced a sum of which the Literary Fund will benefit. In short, there was but one feeling of delight and approbation from beginning to end of this treat ; and every member of the company left its varied pleasures with a grateful sense of the kindness and liberality to which they were indebted for a return to a species of entertainment on which Momus must smile, and Minerva could not frown.

### THE DRAMA.

WE have nothing this week of which to take a separate notice. At *Drury Lane* the Pantomime has been much improved, though the *Clown*, Mr. Jefferini—we name him—in spite of admonition, persists in making it a speaking part throughout ; and thereby, as far as he is concerned, spoiling the performance. Mr. Marshall's Diorama, however, does credit to his talents, and is nightly admired and applauded.—*Covent Garden* has gotten into an eligible and popular train. With excellent operas, and the revival of legitimate comedies of Colman, Sheridan, &c. in the best style, and with very strong casts, the house ought to fill (as it does) every night, independently of the Pantomime. But this has, in itself, become a very great attraction ; and indeed the introductory part alone, with Mr. Payne's admirable acting, is entertainment enough to satisfy the most voracious appetite. The curtainments in the Harlequinade are most judicious ; and Grieves' fine painting, with its charming accompaniment of music, adds a treat of another kind to those already more than sufficient. Our friend the Pig, we lament to observe, has retired from the stage.—At the *Adelphi*, Mr. Telbin's (not Jelbin, as we printed in our last) moving scene is equally beautiful and astonishing ; and the humorous tricks of the holyday-piece go glibly as quicksilver to shouts of laughter and applause. This theatre is also nightly crowded.—The *Haymarket*, eschewing pantomime, has, as per last season, given us *O'Flannagan and the Fairies*, in which Power is worth a Clown, Pantaloon, and Harlequin, in one. Miss P. Horton (his betrothed), of whom we regret to see so little at the *Haymarket*, plays *Mary* very sweetly, and sings a song to the air of "Nora Creena" charmingly. The whole goes off with the liveliest effect.—At the more distant houses we can only say, that they have endeavoured to beat one another in their race to please the public ; and we think that *Father Asop*, at *Sadler's Wells*, has distanced all his competitors ; and many of his changes are quite original.

### VARIETIES.

*Photographic Drawing.*—At a meeting of the Asiatic Society, October 2d, Dr. O'Shaugh-

nessy gave some details, accompanied by specimens, of a new kind of photographic drawing, by means of the sun's light, of which the principle wholly differs from that of Europe, where nitrate of silver is the colouring agent. Professor O'Shaughnessy uses, it seems, a solution of gold, and produces many various tints, from a light rose colour, through purple, down to a deep black; and, what is more extraordinary, a green! He also uses a lens, which expedites the process, and gives different shades.—*Asiatic Journal*.

**Descent of Spiders.**—A letter from Sukkur, on the Indus, dated 17th September, mentions the following phenomenon:—"I was taking a stroll into the fields, when I found myself suddenly covered with a whole host of small and large spiders. On looking about I observed that I was standing in the midst of a large cloud of these animals, who appeared descending in a filmy web of no small dimensions from the upper regions. Having extricated myself with some difficulty from their embraces, I took a position from whence I could see about me, without being annoyed by them, and to my astonishment I beheld descending, maze within maze, and fold within fold, an innumerable host of spiders, all suspended and dancing on their numberless tiny threads, which were at times seen to glance in every variety of shade, amid the beams of the rising sun. The morning was somewhat dark and lowering, and the stillness was now and then broken by some distant rumbling of thunder."—*Ibid*.

*Shakespearean Coincidences with Virgil, Terence, and Horace.*

*Virgil.*

Hamlet's father leaves him in a manner very similar to that in which the ghost of Anchises quits his son Æneas:—

"Fare thee well at once!  
The glow-worm shows the matins to be near,  
And 'gins to pale his uneffectual fire."

*Reed's edition, p. 87, v. 18.*

"Jamque vale! Torquet medius Nox humida curvus;  
Et me servus equis Oriens afflavit anhelis."

*Virgil's Æneid, lib. 3.*

*Terence.*

"Malcoha. Dispute it like a man.  
Machuff. I shall do so,  
But I must also feel it as a man."

This speech, which is invariably received with great applause, puts us in mind of the passage in Terence:—

"Homo sum, humani nil a me alienum puto."

*Horace.*

There is also a curious similarity between Horace and Shakspeare in their mode of expression in the following passage:—

"Who steals my purse steals trash; 'tis something, nothing;

'Twas mine; 'tis his; and has been slave to thousands."

"Novus incola venit;

Nam propria telluris herum natura; neque librum,  
Nec me, nec quemquam statuit."—*Satires, l. lib. 2.*

*E. W.*

**Exhibition of Indian Portraiture, &c.**—The "New York Commercial Advertiser," in a letter from Mr. George Catlin, of the 22d November, announces his immediate departure for London with his exhibition of pictorial representations of the Indians of North America. He says, "I reached forty-eight different tribes, containing in all some 250,000, and speaking some twenty-five or thirty different languages; and have portrayed them and their customs. My collection contains 320 portraits of distinguished personages in the different tribes—all painted from life in their own wigwags—and also two hundred land-

scapes and groups, descriptive of scenery, customs, &c. in the Indian country. If my life be spared (he adds), and I can procure the means of accomplishing it—of visiting all the tribes, which I have yet by no means done. The Lords of the Treasury, in Great Britain, have most generously resolved to admit my gallery free of the customary duties."

**Landlip in Devon.**—A considerable landlip has just taken place on the coast of Devon, by which several cottages have been destroyed and a quantity of the high coast precipitated into the sea.

**Literature, Science, and the Fine Arts in Italy.**—The Austrian government is about to establish an institution in Lombardy, and another in Venice, for the cultivation of literature, the sciences, and arts.

**Earthquake and Tempest in Jamaica.**—On the first Thursday in November, the shock of an earthquake, accompanied by the fall of a torrent of rain, was experienced in Jamaica. The waters overflowed, and much injury was done, besides the loss of several lives.

#### IMPROVITU.

##### *The Penny Postage.*

When I think of the act  
With tears my eye fills;  
For I never shall write  
Again to Frank M—  
The gay world is dead,  
I am left quite alone;  
O cursed be Reform,  
For the Franks are all gone! H. B.

#### EPIGRAM.

##### *On the New Postage Regulations.*

When our Parliament's powers are proclaimed,  
It is often omnipotent named;  
Nor unproved is its claim to the boast:  
Past and Present the same it has made,  
For in sanctioning letters prepaid,  
It has equalled the pre with the post. F. C. H.  
*Cassidy, December 29th, 1839.*

#### LITERARY NOVELTIES.

We are glad to see that Mr. Colburn has announced a new edition of Roby's "Traditions of Lancashire," &c. &c., in a popular form. These beautifully illustrated and interesting volumes have long been out of print, and another supply very generally called for.

We have received a prospectus from Brussels of an "Athenée Historique, ou Recueil de Mémoires, Traité, Dissertations, &c., sur l'Histoire, la Philologie, l'Archéologie, la Numismatique, la Paléographie, &c. Publié par une Société d'Hommes de Lettres." It promises articles of general interest, on the Wallon and Flemish languages, the Nabatheans, the Ommegeanck possessions, the past and present state of the Fauxbourg of Brussels, Celtic monuments, the occupation of Grenoble by the Saracens in the tenth century, &c. &c. &c. The subscription is moderate; and we look with hope to the appearance of the publication.

**Wiltshire.**—A Society of Topographers and Antiquaries has, we are assured, been formed in London, for the purpose of collecting materials for, and publishing accounts of, North Wiltshire; and a respectable committee of gentlemen connected with that portion of the county have issued a prospectus inviting the nobility, clergy, gentry, &c. to co-operate in the cause, so that there may be speedily produced historical accounts of some of the parishes, if they cannot embrace the whole district. Mr. Wyndham, of Salisbury, many years ago, addressed proposals to the Wiltshire gentry to combine their efforts in thus illustrating the history of the county; but without success. We believe the present age is more propitious towards such works.

#### In the Press.

Sorrow and Sympathy, a Tale, by Kennett Dixon, Esq.; together with The Falls of Tivoli, and other minor Poems.

#### LIST OF NEW BOOKS.

Poor Jack, by Captain Marryat, with Illustrations by Clarkson Stanfield, No. 1. 1s.—Dictionary of Practical Medicine, by J. CHARLES HENRY ADAMS.

#### TO CORRESPONDENTS.

*Regent's Park, January 2d, 1840.*

*To the Editor of the Literary Gazette.*

Sir,—In a recent notice of Captain Marryat's last volume on the United States of America, you extracted a passage, in which the author ascribes to Miss Martineau the criticism upon his former volumes in the "Edinburgh Review." Appended to this assertion are reports from the United States, and remarks by the author of the volume, which no one acquainted with Miss Martineau would think of answering. As to the assertion itself, I beg to state, upon incontestable authority, that Miss Martineau has never written a line in the "Edinburgh Review," that she has never seen Captain Marryat's book, or the "Edinburgh Review" of it.

I remain, Sir,

Your very obedient servant,  
JUSTITIA.\*

\* Many of our friends seem to have mistaken our meaning in the brief New Year's Address of our last week's Number. We were simply personae (I not We) when we said, "We must probably be nearing the close of these literary labours." At No. 1197 of a weekly periodical, its editor may properly think that he cannot get through another batch of 1197, *alias*, very near twenty-three years more. It is hoped that this explanation will allay a portion of the excessive national alarm caused by a misapprehension of our meaning.—*Ed. L. G.*

We have this week the pleasure to present our readers with some fine specimens of French wood-cutting, by which they will be enabled to compare the state of this very general and agreeable art in the two countries. We anticipate a continuation of similar examples in our three ensuing Nos. and so enrich our *Gazette* for the month of January.

M. J. cannot be accepted; and we must say the same to the sonnet of G. N. O., though some of the thought is good and well expressed. We are sorry we have not time for advice; but think well enough to say, Go on and prosper.

For the *New Monthly Belle Assemblée* (No I., New Series) we have to thank its Editor. With regard to the pretty lady figures and their pretty dresses, we can offer no opinion; but the letterpress from the pens of Lady Charlotte Bury ("Love and Duty," a Tale), Mrs. Baron Wilson, Mr. Leigh Cliffe, and other contributors, is well suited to the light and amusing character of such a publication.

We have to acknowledge Grant's *London Journal*, No. I. on a plan similar to "Chambers' Edinburgh Journal." It is various, and well selected for popular amusement and information.—*The Chemist*, No. I., is also among our receipts of new-year starting. It is a very useful addition to the communication of chemical facts and experiments, and does credit to the Editor—Mr. Watts, Lecturer on Chemistry, &c.

\* The writer having given us his name, we can vouch for the truth of this statement.—*Ed. L. G.*

In the press, beautifully illustrated, from original Drawings made expressly for this Work,

A NEW EDITION OF THE WORKS OF

**SIR E. L. BULWER, BART. M.P. M.A.**

IN MONTHLY VOLUMES, PRICE SIX SHILLINGS.

Various attempts at Collected Editions of the Works of SIR EDWARD LYTTON BULWER have been made, year after year, in different parts of the Continent, and, in spite of all the imperfections incident on foreign presses, a very extensive demand has rewarded the Publishers of such Editions, in France and Germany, as well as in the United States. Messrs. SAUNDERS and OTLEY beg now to announce the first Uniform Edition of the Works of this Author, printed in his own Country, and addressed to that Public in the hope of whose approval they were originally composed.

The Series will be published Monthly, and include not only all the acknowledged Works of SIR EDWARD LYTTON BULWER that have yet appeared (excepting only those already printed by Mr. COLBURN and Mr. BENTLEY, in their several Libraries of Fiction, and therefore already before the Public in the same popular size and form of Six-Shilling Volumes), but some not hitherto published. The whole will be carefully revised by the Author, and no pains spared to give to this Edition a new and distinctive value.

The Illustrations will be entirely original, from Designs by the first Artists, and engraved in the most finished style.

The First Volume, containing "RIENZI, OR THE LAST OF THE ROMAN TRIBUNES," beautifully illustrated from Drawings by M'CLINE and CRESWICK, will appear on the 1st of February, 1840. The succeeding Volumes will be published regularly on the First of every Month.

Orders are requested to be addressed to the Publishers, Messrs. SAUNDERS and OTLEY, Conduit Street, Hanover Square, London; to their Agents, Mr. J. CUMMING, Dublin, and Messrs. BELL and BRADFUTE, Edinburgh; or to the Booksellers in Town and Country.

THE FAMILY LIBRARY, Vols. 70 and 71.  
In 2 handsome vols. embellished with Eight Engravings, from Originals in the British Museum, price 10s. cloth boards,  
**THE RUINS OF CITIES.**  
By CHARLES BUCKE,  
Author of "The Harmonies and Sublimities of Nature;" forming Vols. 70 and 71 of the Family Library.  
The Family Library will be completed in Eighty Volumes. London: Printed for Thomas Tegg, 78 Chesapeake; and may be procured, by order, of all other Booksellers.

In fcap 8vo. with a Portrait, engraved on Steel by Robinson, a new edition, being the 14th, of  
**THE COURSE OF TIME; a Poem, in Ten Books.**  
By ROBERT POLLOCK, A.M.  
Price 7s. 6d. bound in cloth, or 12s. elegantly bound in morocco, gilt leaves.  
Edinburgh: William Blackwood and Sons. T. Cadell, London; and J. Cumming, Dublin.

Handsomely printed in 8vo. price 15s. each vol.  
**THE HISTORY OF EUROPE, from the Commencement of the French Revolution to the Restoration of the Bourbons.**  
By ARCHIBALD ALISON, F.R.S.E.  
Seven Volumes are published.  
The Eighth, which completes the Work, is in the press.  
"No work could have made such progress in national opinion without substantial qualities. Its vigour of research and its manliness of principle, its accurate knowledge and its animating style, have been the grounds of its remarkable public favour, as they are the guarantee for its permanent popularity."  
—Blackwood.  
"The History of Europe during the French Revolution is indispensable to all those who are forming collections on this subject. It is the completion of them all."—Preface to the French Translation, by M. Pagnis.  
"The History of Europe during the French Revolution is by far the most remarkable historical work of the last century."—Foreign Quarterly Review.  
William Blackwood and Sons, Edinburgh; Thomas Cadell, London; and John Cumming, Dublin.

In 7 vols. fcap 8vo. price 14. 15s. bound in cloth, with Portraits and Vignette Titles,  
**THE WORKS OF MRS. HEMANS.**  
With a Memoir by her Sister.  
The following are published separately, bound in cloth, lettered, with Vignette Titles, price 6s. each; or elegantly bound in morocco, gilt edges, 9s. 6d. each:  
1. Memoir of Mrs. Hemans—Wallace's Invocation to Bruce—England and Spain, or Valour and Patriotism.  
2. Tales and Heroic Scenes, with other Poems and Translations.  
3. The Sceptic—The Siege of Valencia—and other Poems.  
4. The Forest Sanctuary—De Chailion, or the Crusaders—with other Poems.  
5. The Vespers of Palermo; a Tragedy—Records of Woman—Miscellaneous Poems.  
6. Songs of the Affections—National Lyrics—Miscellaneous Poems.  
7. Songs and Lyrics—Scenes and Hymns of Life—with other Poems.  
William Blackwood and Sons, Edinburgh; Thomas Cadell, London; and John Cumming, Dublin.

Price 6s. boards,  
**P O E M S.**  
By the Rev. JOHN STERLING.  
In 6 vols. price 20s. cloth,  
**The Poetical Works of William Wordsworth.**  
Edward Moxon, Dover Street.

#### APPROVED SCHOOL BOOKS.

I.  
**MRS. MARKHAM'S HISTORY OF ENGLAND.**  
6th edition, 2 vols. 12mo. 18s.

II.  
**Mrs. Markham's History of France.**  
4th edition, 2 vols. 12mo. 12s.

III.  
**Mrs. Markham's Historical Conversations.**  
12mo. 6s.

IV.  
**Little Arthur's History of England.**  
By Lady Calcott.  
A new edition, 18mo. 2s.

V.

11th edition, 18mo. 2s. 6d.

VI.  
**Gospel Stories for Children.**  
A new edition, 18mo. 3s. 6d.

VII.  
**Progressive Geography.**  
By the Author of "Stories for Children."  
2d edition, 18mo. 2s.

VIII.  
**Conversations on Nature and Art.**  
By a Lady.  
2 vols. 12mo. 6s. 6d. each, bound.

IX.  
**Bertha's Journal while on a Visit to her Uncle.**  
3d edition, 12mo. 7s. 6d.  
John Murray, Albemarle Street.

DE FOE'S NOVELS AND MISCELLANEOUS WORKS.  
On Wednesday, the 1st of January, was published, printed uniformly with the Waverley Novels, Vol. III. (being the Life of Captain Singleton), price 5s. bound in cloth.  
**THE NOVELS AND MISCELLANEOUS WORKS OF DANIEL DE FOE.**  
This Work is printed by Mr. Talboys, of Oxford. The entire Collection will form 18 vols. Each Work of the Author may be purchased separately.  
Vol. IV. will be published on the 1st of February, and contain the Fortunes and Misfortunes of Moll Flanders.  
London: Printed for Thomas Tegg, 78 Chesapeake; and may be procured, by order, of all other Booksellers.

With Vignette Title, and numerous Woodcuts, Vol. 120 (to be completed in 135 vols.)  
**DR. LARDNER'S CABINET CYCLOPEDIA; being the Habits and Instincts of Animals.**  
By W. SWAINSON, Esq.  
Lately published, by the same Author, with numerous Illustrations, price 6s. each volume.  
Preliminary Discourse on Natural History. 1 vol.  
Geography and Classification of Animals. 1 vol.  
Natural History and Classification of Quadrupeds. 1 vol.  
Animals in Menageries. 1 vol.  
Natural History and Classification of Birds. 2 vols.  
Natural History of Fishes, Amphibians, and Reptiles. 2 vols.  
London: Longman, Orme, and Co.; and John Taylor.

SPLendid ANNUALS FOR 1840.  
Elegantly bound in morocco, 2l. 2s.  
**FINDENS' TABLEAUX. Prose, Poetry, and Art, for 1840. Embellished in a new and unique Style.**

Edited by MISS MITFORD.  
Imperial 4to. India Proofs, 2l. 2s.  
A few Copies, coloured after the original Drawings, 2l. 2s.  
"We know not in what terms to commend this magnificent work. It is the most splendid of all the Annuals. There is a novelty in the designs, the framework on which they are set being composed of smaller sketches from the story, prettily helping out the main idea."—*Athenaeum*.

II.  
Price One Guinea, in morocco elegant,  
**THE ORIENTAL ANNUAL; Tales, Legends, and Romances.**  
By THOMAS BACON, Esq.  
With Engravings by W. and E. Finden. A few India Proofs, royal 8vo. 2l. 12s. 6d.  
"The engravings are greatly superior to any thing we have met with in this work."—*U. S. Gazette*.  
"The embellishments are of the most exquisite kind."—*Herald*.  
"Mr. Bacon has introduced more of life and interest into the literature, and the illustrations are more varied than usual."—*Athenaeum*.  
Charles Tilt, Fleet Street.

Price 2s. 6d.  
**THE COMIC ALMANACK for 1840, with Twelve Plates by George Cruikshank, many Woodcuts, and a great variety of useful and entertaining matter.**  
"The whole series (six years) may be had in Two neat vols. cloth, gilt edges, 2s. 6d. each.  
Charles Tilt, Fleet Street.

**THE LIFE OF SIR WALTER SCOTT, uniform in 22 vols. small 8vo. 12s. Engravings.**  
1. Life, by Mr. Lockhart. 10 vols. 21 Engravings. Just completed.

### REVIEW OF NEW BOOKS.

*The Political Songs of England, from the Reign of John to that of Edward II.* Edited and Translated by Thomas Wright, Esq. M.A. F.S.A. &c. of Trinity College, Cambridge. 4to. pp. 408. London, 1839. Printed for the Camden Society.

MUCH as the Camden Society has already done to illustrate the circumstances, habits, and feelings, of other days, none of its previous publications contain so much of novel and curious information as the volume by Mr. Wright, which has just issued from the press. Heretofore a few specimens of early English political songs have appeared, mixed up with other ancient versification, in the compilations of Percy, Ritson, and others; and in Scotland there are some superb and much longer examples of the same species of composition, in which affairs of church and state are handled with a degree of freedom which, at this distance of time, and with our views of the condition of the people, seems altogether extraordinary. Mr. Wright, in his preface, informs us that "The quantity of such productions has generally varied with the character of the age. They were frequent from a very early period in other countries of Europe, as well as England. It would be easy to produce proofs that in our island they were very numerous in Saxon times,—a few specimens, indeed, have escaped that destruction which visits the monuments of popular and temporary feeling before all others; and for years after the Norman conquest the oppressed people continued to sing the songs of former days at their rustic festivals, or amid their everyday labours. As the feelings which caused them to be remembered died away gradually before the weight of a new political system, a new class of songs also arose. From the Conquest to the end of the twelfth century, the political songs of the Anglo-Normans were in a great measure confined, as far as we can judge from the few specimens that are left, to laudatory poems in Latin, or to funeral elegies on princes and great people. Yet we can hardly doubt that, with the turbulent barons of these troublous times, the harp of the minstrel must have resounded frequently to subjects of greater present excitement. With the beginning of the thirteenth century opened a new scene of political contention. It is amid the civil commotions of the reign of John, that our manuscripts first present traces of the songs in which popular opinion sought and found a vent, at the same time that the commons of England began to assume a more active part on the stage of history. The following reign was a period of constant excitement. The weak government of Henry the Third permitted every party to give free utterance to their opinions and intentions, and the songs of this period are remarkably bold and pointed. These effusions are interesting in other points of view besides their connexion with historical events; they illustrate in a remarkable manner the history of our language; they show us how Latin, Anglo-Norman, and English, were successively the favourite instruments by which the thoughts of our ancestors were

expressed; and collaterally they shew us how the clerk (or scholar) with his Latin, the courtier with his Anglo-Norman, and the people with their good old English, came forward in turns upon the scene. In our songs we see that, during the earlier part of the reign of the third Henry, the satirical pieces which inveighed against the corruptions of the state and demanded so loudly their amendment, are all in Latin; which is as much as to say, that they came from the scholastic part of the people, or those who had been bred in the universities, then no small or unimportant part of the community. They seem to have led the way as bold reformers; and the reformatory of the monastery, not less than the baronial hall, rang frequently with the outbursts of popular feeling. The remarkable and highly interesting declaration of the objects and sentiments of the barons, which was published after the battle of Lewes, is written in Latin. Amid the barons' wars was composed the first political song in English that has yet been found. It is remarkable that all the songs of this period which we know, whether in Latin, Anglo-Norman, or English, are on the popular side of the dispute—all with one accord agree in their praise and support of the great Simon de Montfort. The circumstance of our finding no songs in English of an earlier date does not, however, prove that they did not exist. On the contrary, it is probable that they were equally abundant with the others; but the Latin songs belonged to that particular party who were most in the habit of committing their productions to writing, and whose manuscripts also were longest preserved. It is probable that a very small portion of the earlier English popular poetry was ever entered in books—it was preserved in people's memory until, gradually forgotten, it ceased entirely to exist, except in a few instances, where, years after the period at which it was first composed, it was committed to writing by those who heard it recited. The English song on the battle of Lewes is found in a manuscript written in the reign of Edward II.; when, perhaps, the similar character of the time led people to give retrospective looks to the doings of Earl Simon and his confederate barons. They were sometimes written on small rolls of parchment, for the convenience of the minstrel, who thus carried them about with him from house to house, and chanted them at the will of his entertainers. From these rolls and loose scraps they were occasionally copied into books, long after they had ceased to possess any popular interest."

With regard to his design, Mr. Wright further states that "It was his original intention to continue the series of songs in the present volume to the deposition of Richard II. But having adopted the suggestion of giving a translation, with the hope of making them more popular, and finding that in consequence the volume was likely to extend to a much greater length than was at first calculated upon, it has been thought advisable to close the present collection with another convenient historical period, the deposition of his grandfather Edward II.; and it is his intention at some future period to form a

second volume, which will be continued to the fall of the house of York in the person of the crook-backed Richard III."

And he adds:—

"The wars of Edward III. produced many songs, both in Latin and in English, as did also the troubles which disturbed the reign of his successor. With the end of the reign of Edward II., however, we begin to lose sight of the Anglo-Norman language, which we shall not again meet with in these popular effusions. During the fifteenth century, political songs are less numerous and also less spirited. With it we are introduced to a dark period of literature and science. It was the interval between the breaking up of the old system, and the formation of the new one, which was to be built upon its ruins."

With this interesting explanation of, and, we may remark, very striking glance at, so peculiar a branch of national literary antiquities, we shall proceed to refer to such of them as have most attractions for the general reader, and exhibit the most applicable instances of the fact that our forefathers were very like ourselves, and that the nature of man is always the same, though it assumes various hues and shapes under different aspects and conditions. We begin with a sample of a Latin song very early in the twelfth century (reign of King John, 1199-1216), and thus introduced by Mr. Wright:—

"It was during these religious dimensions that arose up, or at least became strong, that powerful spirit of opposition to the papal tyranny, which produced during the whole of this century so much satirical poetry; much of it attributed, perhaps with little reason, to Walter Mapes. The following song is supposed to have been written during the interdict:—

"Roma capit singulos et res singulorum;  
Romanorum curia non est in forum.  
Ibi sunt venalis iura senatorum,  
Et solvit contraria copia numerorum.  
Hic in consistorio si quis causam regat  
Suam, vel alterius, hoc in primis legat,  
Nisi det pecuniam Roma totum negat,  
Qui plus dat pecunie melius allegat."

"Rome receives all, and the goods of all; the court of the Romans is but a market. There are offered for sale the rights of the senators, and abundance of money dissolves all differences of opinion.—Here, in the consistory, if any body plead a cause, be it his own or another's, let him first read this.—Unless he give money, Rome denies every thing; he who gives most money will come off the best."

"Solam avaritiam Roma novit parca,  
Parci danti munera, parco non est parca:  
Nummus est pro numine, et pro Marco marca.  
Et est minus celebris ara, quam albi arca.  
Cum ad papam veneris, habes pro constanti,  
Non est locus pauperi, soli faveat danti:  
Vel si munus prestitum non est aliquanti,  
Respondet hic tibi sic, Non est michi tanti.  
Papa, si rem tangimus, nomen habet a re,  
Quicquid habent alii, solus vult papae;  
Vel si verbum Gallicum vis apocopeare,  
Papa, Pape, dic li mot, al vis impetrare."

Papa querit, chartula querit, bulla querit,  
Porta querit, cardinalis querit, cursor querit,  
Omnes querunt: et si quod des uni deerit,  
Totum jus falsum est, tota causa perit."

"Penurious Rome claims acquaintance with nothing but avarice; she spares to him who brings gifts, but she spares not to him who is penurious: money stands in the place of God, and a marc for Mark, and the altar is less attended than the coffer.—When you come to the pope, take it as a rule, that there is no place for the poor, he favours only the giver; or if there is not a bribe of some value or another forthcoming, he answers you, 'I am not able.'—The pope, if we come to the truth of the matter, has his name from the fact, that, whatever others have, he alone will suck the pap; or if you like to apostrophize a French word, 'Pay, pay,' with the word, if you

wish to obtain anything.—The pope begs, the brief begs, the bull begs, the gate begs, the cardinal begs, the curser begs,—all beg! and if you have not wherewith to bribe them, all your right is wrong, and the whole cause comes to nothing."

This is bitter enough for a period when we are apt to consider the pope as being all-powerful. We have a playful song upon the tailors so early as the reign of Henry III.; and it is followed by some remarkable pieces relating to the Barons' wars. One long poem, of nearly 1000 lines, written after the battle of Lewes, is quite new to us, and seems to be of much importance in illustrating the political feeling of the time, and the history of the English constitution. We can only give the concluding lines:—

"Ex predictis omnibus poterit liquere,  
Quod regem magnatibus incumbit videre  
Que regni conveniant gubernationi;  
Et pacis expediant conservacioni;  
Et quod rex indigenas sibi laterales  
Habeat, non advenas, neque speciales,  
Vel consiliarios vel regni majores,  
Qui supplantant alios atque bonos mores.  
Nam talis discordia paci noveratur,  
Et inducit prelia, dolos machinatur.  
Nam sicut invitit diaboli mortem  
Induxit, sic odia separat cohortem.  
Incolas in ordine suo rex tenebit,  
Et hoc moderamine regnando gaudebit.  
Si vero studuerit suos degradare,  
Ordinem poverit, frustra queret quare  
Sibi non obtemperant ita perturbati;  
Immo si sic facerent essent insensati."

"From all that has been said, it may appear evident, that it becomes a king to see together with his nobles what things are convenient for the government of the kingdom, and what are expedient for the preservation of peace; and that the king have natives for his companions, not foreigners, nor favourites, for his councillors or for the great nobles of the kingdom, who supplant others and abolish good customs. For such discord is a step-mother to peace, and produces battles, and plots treason. For as the envy of the devil introduced death, so hatred separates the troop. The king shall hold the natives in their rank, and by this governance he will have joy in reigning. But if he study to degrade his own people, if he pervert their rank, it is in vain for him to ask why thus deranged they do not obey him: in fact, they would be fools if they did."

In a song against the King's Taxes in the time of Edward I., there is much extraordinary matter. *Es. gr.*

"Ore court en Engleterre de anno in annum  
Le quinquisme dener, pur fere sic commune dampnum.  
E fet avaler que soleyent sedere super scamnum;  
E vendre fet commune gent vaccas, vas, et pannum.  
Non placet ad summum quindenum sic dare nummum."

Une chose est cointre foy, unde gens gravatur,  
Que la meyté ne vient al roy, in regno quod levatur.  
Pur ce qu'il n'ad tot l'enter, prout sibi datur.  
Le pueple doit le plus doner, et sic sincopatut.  
Nam que taxantur, regi non omnia dantur.

Unquore plus greve a simple gent collectio lanarum,  
Que vendre fet communement divities earum.  
Ne puet estre que tiel conseil constet Deo carum,  
Icel destrure le poverail pondus per amarum,  
Non est lex sana, quod regi sit mea lana.

Unore est plus outre peis, ut testantur gentes,  
En le sac deus pers ou treis per vim retinentes.  
A qui remeindra cele leyne? quidam respondentes.  
Que ja n'avera roy ne regne, sed tantum colligentes.  
Pondus lanarum tam falsum constat amarum.

Depus que le roy vadera tam multum cepisse,  
Entre les riches si purra satis invenisse;  
E plus, a ce que m'est avys, et melius fecisse  
Des grants partie aver pris, et parvis peperisse.  
Qui capit argentum sine causa peccat egentium.

Homme ne doit a roy reter talem pravitatem,  
Mes al mavelis consiler per ferocitatem.  
Le roy est jeoveine bachiler, nec habet atatem,  
Nule malice empasseer, sed omnem probitatem.  
Consilium tale dampnum confert generale."

"Now goes in England from year to year—the fifteenth penny, to do thus a common harm.—And it makes them go down, who used to sit upon a bench;—and it obliges the common people to sell both cows, vessels, and clothes. It does not please thus to pay the fifteenth to the last penny. One thing is against faith, whereby the people is aggrieved,—that the half of what is raised in the kingdom does not come to the king.—Since he has not the whole, as it is given to him,—the people is obliged to give the more, and thus they are cut short.—For the taxes which are raised are not all given to the king. The collecting of the wool grieves the common people still more,—which drives them commonly to sell their property.—Such counsel cannot be acceptable to God,—thus to destroy the poor people by a hither barthen.—It

is not sound law, which gives my wool to the king. What is still more contrary to peace, as people witness,—they retain two or three parts in the sack.—To whom shall remain this wool? Some answer,—that neither king nor queen shall have it, but only the collectors.—Such a false weight of wool is manifestly a bitter thing. Since the king is determined to take so much,—he may find enough among the rich;—and he would get more and do better, as it appears to me,—to have taken a part from the great, and to have spared the little.—He sins who takes the money of the needy without cause. We ought not to lay such wickedness to the charge of the king,—but to the bad counsellor by his rapacity. The king is a young bachelor, and is not of an age—to compass any malice, but to do all probity.—Such counsel does general harm."

The law abuses of the age are also exposed, and in whimsical verse:—

"Sunt iustitiarum,  
Quos favor et denarii  
alliciunt a jure;  
Hii sunt nam bene recole,  
Quod censum dant diabolo,  
et serviunt hii pure.  
Nam jubet lex naturæ,  
Quod iudex in iudicio  
Nec prece nec pretio  
acceptor sit persona;  
quid, Jhesu ergo bone,  
Fiet de iudicibus,  
Qui prece vel muneribus  
cedunt a ratione?  
Revera tales iudices  
Nuncios multiplices  
habent;—audi quare.  
Si terram vis rogare,  
Accedet ad te nuncius,  
Et loquitur discretus,  
dicens, 'Amice care,  
vis tu placitare?  
Sum cum iustitiarum  
Qui te modo vario  
possum adjuvare;  
si vis impetrare  
Per suum subdolum,  
Da michi dimidium,  
et te volo juvare.'  
Ad pedes sedent clerici,  
Qui velut famelici  
sunt, donis inhiantes;  
et pro lege dantes,  
Quod hii qui nichil dederint,  
Quamvis cito venerint,  
crunt expectantes.  
Sed si quendam nobilis,  
Pulcra vel amabilis,  
cum capite comuto,  
auro circumvoluto,  
Accedet ad iudicium,  
Hæc expedit negotium  
ore suo muto.  
Si pauper muliercula,  
Non habens munuscula,  
formam neque genus,  
quam non pungit Venus,  
Infecit negotio  
Suo pergit hospitio,  
dolendo corde tenus."

"There are judges, whom partiality and bribes seduce from justice; these are they, I remember well, that pay toll to the devil, and they serve him alone. For the law of nature commands, that a judge in giving judgment should not be an acceptor of any body either for prayer or money; what therefore, O good Jesus, will be done with the judges, who for prayers or gifts recede from what is just? In fact such judges have numerous messengers;—listen for what purpose. If you wish to claim land, a messenger will come to you, and speaks in confidence, saying, 'Dear friend, do you wish to plead? I am one who can help you in various ways with the judge; if you wish to obtain any thing by his aid, give me half, and I will help you.' At his feet sit clerks, who are like people half-famished, gazing for gifts; and proclaiming it as law, that those who give nothing, although they come early, will have to wait. But if some noble lady, fair and lovely, with horns on her head, and that encircled with gold, come for judgment, such a one despatches her business without having to say a word. If the woman be poor, and has no gifts, neither beauty nor rich relationship, whom Venus does not stimulate, she goes home without effecting her business, sorrowful at heart."

There are some very curious songs about Peter de Gaveston; for instance:—

"Arbor mala succiditur,  
dum collo Petrus cæditur!—  
Sic benedicta frames  
que Petrum sic aggreditur!  
Bestia manius jugulans!  
beatus jubens jugulum!  
Bestium ferrem ferientem  
quem ferre nollet sæculum!"

"The bad tree is cut down, when Peter is struck on the neck;—Blessed be the weapon which thus approached Peter! Blessed be the hand which executed him!"

blessed the man who ordered the execution! blessed the steel which struck him whom the world would not bear any longer!"

But if these extracts shew that the work has retrieved much that is extremely valuable from strangely neglected sources of national literature, what shall we say to the Appendix, which alone would have been entirely satisfactory for such a publication? Of it the editor states:—

"The Appendix consists of extracts from the inedited metrical chronicle of Peter Langtoft, which are here introduced, because they contain fragments in what was then termed '*ryme coule*,' or tailed rhyme, which are apparently taken from songs of the time. The text is printed from a transcript made by the editor several years ago; and it contains many lines of the English songs which are not found in the manuscripts preserved at the British Museum. The editor introduces these extracts the more willingly, as it is not very probable that the chronicle itself will be published at present. As a monument of the Anglo-Norman language, it is far inferior to many others that remain still inedited; and, as a historical document, it is already well known through the English version of Robert de Brunne, which was printed by Thomas Hearne. The collations have been made chiefly with a philological view; the comparison of the different manuscripts shews us how entirely the grammatical forms of the Anglo-Norman language were at this time neglected. To these extracts, the editor has been enabled to add a very curious English poem from the Auchinleck MS. at Edinburgh, by the extreme kindness of David Laing, Esq., to whom the Camden Society owes the transcript and collation of the proofs of this poem."

This poem of Langtoft has never, we believe, been printed, though known in some measure, as mentioned, through the irregular kind of translation made some years after by Robert de Brunne, but in which the pith and spirit of the original seems often to be lost. The scraps of English song are particularly curious; but we can only pick out a few bits, almost at random, touching Edward's war with Scotland:—

"Escote soit maldit de la Mere Dé!  
E parfount a diable Gales enfouendré!  
En l'un ne en li autre fust unkes verité.  
Car si toust en Gales guere est comencé,  
Et de Aquitaine le covenant taillé  
Fu par le rai de France rumpu e refusé,  
E Edward e Philippe comencent medlé,  
Li fol rai de Escote, Jon Baillo nome,  
Que par le ray Edward al regne est aprouvé,  
Par l'entement de sun faus barne,  
Escoute sun homage e escoute sa fealté,  
Ad la court de Rome des engers maundé,  
A Celestine le pape, ke al houre tint le sé,  
Par suggestiun ad fausement demestré  
Ke le regne d'Escote ou la dignité  
Dait de li tenir par antiquité,  
Et li rai Edward par poer e posté  
Li fiat fere homage encourte volenté;  
E prie q'il seil assols e devolupé  
De la fay le ray, a ki il fu joré.  
La pape Celestine, trop deavysé,  
Assolt le rai d'Escote par lettre enbulé."

"May Scotland be accursed of the mother of God!—and may Wales be sunk down deep to the devil!—In neither of them was there ever truth.—For as soon as war was commenced in Wales,—and the covenant which had been cut out in Aquitaine—was broken and refused by the King of France,—and Edward and Philip began hostilities,—the foolish King of Scotland, named John Baillo,—who was brought to the kingdom by King Edward,—by the seductions of his false baronage,—against his homage and against his fealty,—sent messengers to the court of Rome—to Pope Celestine, who at the time held the see,—by a trick falsely shewed—that the kingdom of Scotland with the dignity—ought to hold of him by testimony of ancient times,—and that King Edward by force and might—made him do homage against his will;—and prays that he may be absolved and delivered—from his faith to the king, to whom he was sworn.—

Pope Celestin, too unadvised,—absolves the King of Scotland by his bull.\*

"Quant Berwike fu pris, [de] denz estalt trové  
Or e argent sauns nombre, des altes metals plente,  
Et toute la nobley ke apendait à cité.  
Ly Bailloill ad perdu li issue e l'entré  
De la plus noble ville que fust en sa poesté.  
Le rais Edward la tent conquis par l'espé,  
La fet environner de fosse large e lé,  
En restrovaunt l'Escote k'ad de li chaunté,  
E par mokerie en Englaiss rymaïé.  
Piket hym and diket him,  
On scorne saiden he,  
hu best hit mal be.  
He piket and he diket,  
On lengthe alle him likes,  
als hy mowe best y-se.  
Scattered heir the Scotte,  
Hodred in the hottes,  
never thal ne the:  
Riht if y rede,  
Thay toublem in Tweede  
that woned bi the se."

"When Berwick was taken, there was found within it—gold and silver without measure, and plenty of the other metals, and all the nobility which belonged to a city.—The Baili had lost the issue and entry—of the noblest town that was in his power.—King Edward holds it conquered by the sword.—causes it to be surrounded with a ditch large and broad,—in reproach of the Scot who had sung of him,—and made rhymes in English for mockery.—Let him pike and let him dike,—they said in scorn,—how it may best be.—He piket and he diket,—in length as he likes,—as they may best see.—Scattered are the Scots,—huddled in their huts,—they never thrive:—Right if I read,—they tumble in Tweed—who dwell by the sea."

Of our famous Wallace and his followers, the admirer of Edward speaks most disparagingly:—

"O! cum Deus est bons de draytelous guerdouns,  
Ke taunt sovent nous ad vengé de felouns!  
Novel avoms oy entre compaygnouns  
De William le Walays, mestre de larouns:  
Sire Jon de Meneteit li suist à talouns,  
Enprès de sa puteye li prist en tapisouns:  
A Loundres le menait en ferges et laceouns,  
Où juges esteit sur cels condicions:  
En primer a fourches fust traïne pur tresouns,  
Pendu pur robberyes et pur occisions,  
Et pur ceo k'il avait ennemy par avouns.  
Viles et egles et religions,  
Avaies est de fourche et overt les ventouns,  
Le quier et la bowel brulez en carbouns,  
Et copé la teste par tels mesprisouns,  
Pur ceo ke il avait par ces havylouns  
Maintenus la guerre, doné protecciouns,  
Seysye seignurie en ses subjecciouns  
De altri realme par ses entrusiouns.  
Cope il fust le cors en quatre porciouns,  
Chescun pende par say en meimor de ses nouns,  
En lu de sa banere cels sunt ces gunfanouns.  
Pur finir sa geste,  
A Loundres est sa teste,  
du cors est fet partye  
En .liiii. bones viles,  
Dout honorer les ylls  
ke sunt en Albanye.  
And tus may you here,  
A ladde to lere  
to bligen in pais.  
It fallis in his eghe,  
That hackes ovre heghes,  
wit at Walaya."

"O! how God is good in his just dealings,—who has so often revenged us of felons!—We have heard news among companions—of William Wallace, the master of the thieves!—Sir John de Meneteith followed him close at his heels,—and took him in bed beside his strumpet; he brought him to London in fetters and bonds,—where he was judged on the following conditions:—first to be drawn to the gallows for his treasons,—to be hung for robbery and for slaughter,—and because he had destroyed by burning—towns and churches and monasteries,—he is taken down from the gallows, and his belly opened,—the heart and bowels burnt to ashes,—and his head cut off for such faults,—because he had by these . . . maintained war, given protections,—seized lordship into his subjection—of the realm of another by his intrusions.—His body was cut into four parts,—each hung by itself in memory of his name,—instead of his banner these are his standards.—To finish his history,—at London is his head,—his body is divided—in four good towns,—whereby to honour the laies—that are in Albania.—And thus may you hear,—a lad to learn—to build in peace.—It falls in his eye,—who hacks too high,—with the Wallace."

We regret that we have come to the end of our limits, for there is much more to tempt us to extract. But we have only left ourselves room for an example of Mr. Wright's excellent and elucidatory notes:—

"The Song of the Barons.—The transcript of this curious fragment was communicated to me by Sir Frederick Madden. The original is written in a contemporary hand, on a roll twenty-two inches long, by three broad, and was evidently intended to be carried about by the minstrel who was to sing it. On the reverse had been written a curious interludic poem in English of a later period, entitled, 'Interludium de Clerico et Puella.' It was, in 1836, in the possession of the Rev. Dr. Richard Verburgh, Vicar of Sleaford, in Lincolnshire. Such rolls appear to have been in common use. A very curious vellum roll of the fifteenth century, containing chiefly religious songs with the music, and, among the rest, a copy of the well-known song on the battle of Agincourt, printed by Percy, has been recently deposited in the library of Trinity College, Cambridge. I am informed that another, of the thirteenth century, has been lately found among the archives of Sir John Hanmer, Bart., containing an Anglo-Norman romance previously unknown, on the adventures of Melors, son of Melians of Cornwall. Among the Sloane MSS. in the British Museum (No. 809), is an early copy of the curious poem of Walter de Bibbesworth, designed for the instruction of children in the French language, written in a similar manner on a roll of parchment, evidently for the purpose of being more easily used in a school."

*Correspondence of William Pitt, Earl of Chatham.* Edited by W. S. Taylor, Esq. and Capt. J. H. Pringle, &c. from original MSS. Vols. III and IV. London, 1839. Murray.

To render any thing like justice to a work of this importance requires more leisure than we have found it possible to devote to it this week. We cannot, however, permit even one Saturday to pass without announcing it to the public, and briefly saying that if the former volumes were full of national interest, these are not less so. Indeed, whether we view the whole of this correspondence as illustrating the characters of George III. and of Lord Chatham; the political concerns of England at home and abroad; the influence of a single mind upon the affairs of the world and the destinies of millions of mankind and of ages yet to come; the curious involutions of party in parliament, and the intrigues and disorganisation of cabinets; the conflicts of ambition and the waverings of principle between patriotism and selfishness; in short, the whole machinery of government and its application to governing, as lessons to be studied with deep attention at all times, and with every association of statesmen and ministers, this work must ever command the earnest consideration of the British people. In minor points, the throwing new light upon the authorship of "Junius," and bearing strongly upon constitutional questions, even now of singular interest, will also attract the reader; and we have only to repeat our regret that we can in the first instance offer so little to lead to the principal topics, or exemplify the extreme value of the whole. In the issue between Stockdale and the House of Commons, the following passage strikes us forcibly. On the 9th of May, 1769, seventy-two members getting up a decided opposition, dined together at the Thatched House Tavern, where the seventh toast was: "Mr. Cavendish's creed—I do from my soul detest and abjure that damnable doctrine and position, that a resolution of the House of Commons can make, alter, suspend, abrogate, or annihilate, the Law of the Land."

A letter from William Pitt's tutor (August 2d, 1766) marks the early promise of the gifted son of a gifted sire:—

"My Lord Pitt (he says) is much better, Lady Hester quite well, and Mr. William very near it. The last gentleman is not only contented in retaining his papa's name, but perfectly happy in it. Three months ago he told me, in a very serious conversation, 'he was glad he was not the eldest son, but that he could serve his country in the House of Commons like his papa.'"

Lord Chatham's opinion on the riots in

October, the same year, claims particular attention at this moment:—

"With regard to the riots (he writes to Lord Shelburne), Lord Chatham thinks it his duty most humbly to submit his advice, that a special commission for trying rioters, guilty of felony, in order to make one example in each county, appears highly proper, and even absolutely necessary, for the support of any reverence to law and government, and to strike a more immediate awe into offenders."

One short letter, in proof of the king's firmness, must have place:—

"The King to the Earl of Chatham.

St. James's, m. past eleven, P.M.

[December 2, 1768.]

"Lord Chatham,—On my return from the hall-room, I found your letter containing the Duke of Bedford's extravagant proposal. Indeed I expected, from his choosing to deliver his answer in person, that he meant to attempt obtaining an office or two in addition to those offered; but could not imagine that even the rapaciousness of his friends could presume to think of more than that. I know the uprightness of my cause, and that my principal ministers mean nothing but to aid in making my people happy; therefore, I cannot exceed the bounds you acquainted Lord Gower were the utmost that would be granted. This hour demands a due firmness; 't is that has already dismayed all the hopes of those just retired, and will, I am confident, shew the Bedfords of what little consequence they also are. A contrary conduct would at once overturn the very end proposed at the formation of the present administration; for to rout out the present method of parties banding together, can only be obtained by a withstanding their unjust demands, as well as the engaging able men, be their private connexions where they will. I shall be ready to receive you tomorrow at two o'clock at the Queen's house."

"GEORGE R."

In another letter his majesty writes:—

"I am strongly of opinion with the answer you sent the Duke of Grafton; but, by a note I have received from him, I fear I cannot keep him above a day, unless you would see him and give him encouragement. Your duty and affection for my person, your own honour, call on you to make an effort: five minutes' conversation with you would raise his spirits, for his heart is good; mine, I thank Heaven, want no rousing: my love to my country, as well as what I owe to my own character and to my family, prompt me not to yield to faction. Be firm, and you will find me amply ready to take as active a part as the hour seems to require. Though none of my ministers stand by me, I cannot truckle."

But we must conclude for the present, which we do with a remarkable epistle:—

"Junius" to the Earl of Chatham.

"(Private and secret: to be opened by Lord Chatham only.)

London, January 2, 1768.

"My Lord,—If I were to give way to the sentiments of respect and veneration which I have always entertained for your character, or to the warmth of my attachment to your person, I should write a longer letter than your lordship would have time or inclination to read. But the information which I am going to lay before you will, I hope, make a short one not unworthy your attention. I have an opportunity of knowing something, and you may depend on my veracity. During your absence

\* "This is the first of two private letters addressed to Lord Chatham by this distinguished writer. Facsimiles of the autographs of both are given in the fourth volume."

from administration, it is well known that not one of the ministers has either adhered to you with firmness, or supported, with any degree of steadiness, those principles on which you engaged in the king's service. From being their idol at first, their veneration for you has gradually diminished, until at last they have absolutely set you at defiance. The chancellor, on whom you had particular reasons to rely, has played a sort of fast and loose game, and spoken of your lordship with submission or indifference, according to the reports he heard of your health; nor has he altered his language until he found you were really returning to town. Many circumstances must have made it impossible for you to depend much upon Lord Shelburne or his friends; besides that, from his youth and want of knowledge, he was hardly of weight, by himself, to maintain any character in the cabinet. The best of him is, perhaps, that he has not acted with greater insincerity to your lordship than to former connexions. Lord Northington's conduct and character need no observation. A singularity of manners, added to a perpetual affectation of discontent, has given him an excuse for declining all share in the support of government, and at last conducted him to his great object, a very high title, considering the species of his merit, and an opulent retreat. Your lordship is best able to judge of what may be expected from this nobleman's gratitude. Mr. Conway, as your lordship knows by experience, is every thing to every body, as long as by such conduct he can maintain his ground. We have seen him in one day the humble prostrate admirer of Lord Chatham; the dearest friend of Rockingham and Richmond; fully sensible of the weight of the Duke of Bedford's party; no irreconcilable enemy to Lord Bute; and, at the same time, very ready to acknowledge Mr. Grenville's merit as a financier. Lord Hertford is a little more explicit than his brother, and has taken every opportunity of treating your lordship's name with indignity. But these are facts of little moment. The most considerable remains. It is understood by the public that the plan of introducing the Duke of Bedford's friends entirely belongs to the Duke of Grafton, with the secret concurrence, perhaps, of Lord Bute, but certainly without your lordship's consent, if not absolutely against your advice. It is also understood, that if you should exert your influence with the king to overturn this plan, the Duke of Grafton will be strong enough, with his new friends, to defeat any attempt of that kind; or if he should not, your lordship will easily judge to what quarter his grace will apply for assistance. My lord, the man who presumes to give your lordship these hints, admires your character without servility, and is convinced that, if this country can be saved, it must be saved by Lord Chatham's spirit, by Lord Chatham's abilities.\*

"To the Earl of Chatham, &c. &c. &c. &c.  
"at Hayes, near Bromley, Kent."

\* It may be remarked, that this panegyric on Lord Chatham adds considerable weight to an opinion entertained by many persons; namely, that some of the Miscellaneous Letters inserted in Woodfall's edition of "Junius" are erroneously attributed to that distinguished writer. The five letters written on the 28th of April, the 28th of May, the 24th of June, and the 19th of December, 1777, and that on the 16th of February, 1783, under the signatures of Poplicola, Anti-Sejanus Junior, Downright, &c., are conceived in a spirit of bitter animosity to that nobleman; and it is incredible, that the same individual should anonymously and privately address a minister in terms expressive of 'respect and veneration,' at the very time that he was endeavouring to destroy that minister's influence, by publicly ridiculing his infirmities, and giving to the world anonymous libels on his character and conduct."

*The Letter-Bag of the Great Western; or, Life in a Steamer.* By the Author of "The Sayings and Doings of Samuel Slick." 1 vol. 12mo. pp. 323. London, 1840. Bentley.

ACUTE, observant, shrewd, and humorous, it is impossible to have aught from the pen of "Sam Slick" which is not pungent and entertaining. In the present volume he seems to have elaborated his whimsicalities more than on former occasions, and to have wrought out his jokes and puns to the utmost possible extent. Upon such a performance criticism would be thrown away; and we shall be content to indicate the author's varieties, and allow him to be his own reviewer. We have only to premise, that the *Letter-Bag* purports to be a collection of the correspondence of a number of the passengers of both sexes, all ages, and sundry conditions of life, who went out with the illustrious "Slick" in the Great Western Steamer to America; and that it is introduced by a playful dedication to Lord John Russell, the commencement of which we quote as a fair sample of the writer:—

"My Lord,—Your lordship will, no doubt, be at a loss to understand how it is that you have had the honour of this dedication conferred upon you, which you have so little reason to expect, and (as you have never seen, and probably never heard of, the author) must be conscious have done so little to him to deserve; and it is but reasonable and just that I should explain the motives that actuated me. Dedications are mendacious effusions we all know, and honest men begin to be ashamed of them, as reflecting but little honour on the author or the patron; but in a work of humour an avowal of the truth may well find a place, and be classed among the best jokes it contains. I have selected your lordship, then, as my Mæneas, not on account of your quick perceptions of the ridiculous, or your powers of humour, but solely on account of the very extensive patronage at your disposal. Your lordship is a colonial minister, and I am a colonial author: the connexion between us, therefore, in this relation, is so natural, that this work has not only a claim to your protection, but a right to your support. All the world will say that it is in vain for the Whig ministry to make protestations of regard for the colonies, when the author of that lively work, *The Letter-Bag of the Great Western*, remains in obscurity in Nova Scotia, languishing for want of timely patronage; and posterity, that invariably does justice (although it is unfortunately rather too late always), will pronounce that you failed in your first duty, as protector of colonial literature, if you do not do the pretty upon this occasion. Great men are apt to have short memories; and it is a common subject of complaint with authors that they are materially injured by this defect in their organisation. Literary men, however, may ascribe much of this disappointment they experience to their own disingenuousness. They usually begin by expressing great diffidence of their own talents, and disparaging their own performances, and end by extolling the acquirements, the liberality, and discernment of their patrons; and they generally admit the truth of both these propositions, which is all that is required of them, and there the matter ends. I prefer the most straightforward course of telling the truth; and so far from detracting from the merits of the work, and undervaluing myself, I am bold to say it is quite as good a book, and as safe in its tendencies, as those of a certain fashionable author who found favour at the hands of your party, and is therefore eminently

entitled to your special regard. I have inscribed it to you, therefore, not for the purpose of paying a compliment to your lordship, but that you may have an opportunity of paying a very substantial compliment to me. Like an eastern present, it is expected that it should be acknowledged by one of still greater value; and in order that there may be no mistake, I beg your lordship to understand distinctly that its merits are very great, and that the return should be one suitable for your lordship to give and me to receive, and not such a one (as the Canadian rebels said to Lord Durham) 'as shall be unworthy of us both.'"

"Sam" now becomes more serious, and complains of want of patronage to the colonies, and especially at the coronation. He says,—

"We afford a wide field for the patronage of our more fortunate brethren at home, and governors, admirals, commissioners, and secretaries, are first promoted over us, and then rewarded with further promotion for the meritorious endurance of a five years' exile among the barbarians. Like a good shepherd, my lord, open the gates, and let down the bars, and permit us to crop some of our own pastures, that good food may thicken our fleeces and cover our ribs; for the moaning and bleating of the flock as they stretch their heads over the fence that excludes them, and regard with longing looks the rich herbage, is very touching, I assure you. It does not become me, my lord, to say what I do expect for myself; but if the office of distributor of honours and promotions among colonists is vacant, as there are no duties to perform, and the place is a sinecure, it would suit me uncommonly well, and afford me leisure to cultivate talents that are extremely rare among the race of officials. Such a step would confer great honour on your lordship, and do me justice."

We had intended to mark the "Journal of an Actress" for extracts, but accidentally took a wrong page, and so must give one from a Traveller before he had travelled, which is a laughable satire upon the scribbling class of Tourist-publishers. After a few preliminary words, the pseudo-traveller writes:—

"I am, therefore, off in the Great Western, and hope to scour the country in eight weeks, by starting at once, after my arrival, for the extreme points. I shall in a few days reach the prairies by means of railroads and canals, from whence I will dash on among the Pawnees, and kill a buffalo, and from the hunters I will get all I want to fill up the detail. I will then visit the scenes of recent disturbances in Canada, and obtain an interview with some of the rebel leaders, and, by thus dwelling on opposite points, give a magnificent idea of the extent of the ground I have gone over. I have had the book already written for some months past, at least all the laborious parts of it, and have nothing to fill in but the jests and the anecdotes. I have avoided the rambling mode adopted by Hall, Hamilton, and Marryat, and have given it an elaborate, scientific, and analytical division, as follows:—1st, Book embraces the geographical position, and natural resources, area, and population; 2d, Political statistics, including government revenue and expenditure, civil, military, and naval affairs; 3d, Moral statistics (that is a title that will please the Rads vastly), including religion and education; 4th, Medical statistics, including comparative mortality, &c.; 5th, Economical statistics, including agriculture, manufactures, navigation, trade, &c. All this is done, and, in my opinion, devilish well done, for a man who knows nothing about it;

but the United States almanacs, road manuals, newspapers, and guide-books, have furnished abundant, and, I am inclined to think, authentic information. It is but to hash up the cold collations of my predecessors. The deductions and theories from these facts I feel I can draw as well in London as in America. In this the publishers agree; but they say they want life—'verisimilitude' is their word, and 'striking incidents.' The politics are on the safe side—ultra-radical. I have applied a sledge-hammer to the church in the colonies, blown up the rectories and clergy reserves sky-high, gone the whole figure for responsible governments (though, between you and me and the post, I can't for the life of me understand the difference between that, in the sense demanded, and independence), for ballot, universal suffrage, and short parliaments, and illustrated these things by their practical working in the New States of America. As respects the House of Lords, that is a delicate subject. My friend — fell foul of it, and charged it with legislating in ignorance and inattention. This course may do for him, but, for obvious reasons, I think it imprudent in me. His section is the most aristocratic of the parties at present, and I doubt if it would serve my turn to follow his example. The church is a different thing; that is fair game; and I am, in this liberal age, backed by high authority for giving it no quarter. Besides, it is not a church militant. I have gone beyond Brougham in this, who swears it was the church was the cause of the rebellion in Canada. As respects the state of slavery in the States, I have gathered anecdotes on board from some travellers, that are capital; especially of Jefferson selling his own children, flogging others, and playing the very devil; of a descendant of Washington being a slave, and set up at auction; and of a white wife being compelled to wait upon the black mistress of her husband, and so on. Talking of slaves reminds me of the 'Barbadoes Globe,' of the 15th August, which I send you. Read the sermon of an abolition Captain Somebody: it is capital. I wish it served our views to insert it; if it did, I would do so, for it would make an excellent article, particularly where he points to one of their masters, and tells the negroes they must not kill him—must not hate him for his cruelties, and so on; like the old story of not ducking the pickpocket. It is magnificent. That fellow ought to head a commission. The Quakers should put him into parliament. Of Lynching I have got some choice stories, and will endeavour to pass through the State where they took place, to give them from the spot. Of the Bowie-knife, Arkansas's tooth-pick, and other stilettos in use among the settlers on the Indian borders, I imported a specimen when I began the work, and had drawings made in London. On waste lands in the colonies, some people we wot of have made capital speeches, I understand, as I have written my book, from official returns and fancy. I hear they are right in part, and in part wrong; the right part everybody knew, the wrong nobody ever heard of before. I will 'discourse most learnedly' on this matter. I can boast now that I am an eye-witness. '*Ego te intus, et in cute novi*;' which is more than either of them can say, at any rate. I have made out the following list of subjects for anecdotes, which, like a cork jacket, will make the body of the book float lightly. The appetite of the public is like that of the boa constrictor—it is not satisfied with less than the whole hog.

Lynching—spitting—gouging—steamboats blown up—slavery—sales and breeding of slaves—licentious manners of the south—slang expressions of the east and west—border doings in Canada—Clay—president—Webster—ignorance of the fine arts—bank frauds—land frauds—stabbing with knives—dinner toasts—flogging in the United States' navy—voluntary system—advantage of excluding clergymen from schools; instance, Gerard's College, &c.—cruelty to Indians—ravenous eating—vulgar familiarity—boarding-houses—list of names of drink—watering-places—legislative anomalies, and tricks of log rolling bills—anecdotes of Papineau—Sir John Colborne and Sir F. Head—and some few of women, perhaps the most attractive of all. These I can gather from travellers, and from party-men, who, in all countries, never spare their opponents, and from country journals, and the speeches of mob-orators. It will spice the work, afford passages for newspaper puffs and paragraphs, and season the whole dish. All this can be accomplished in eight weeks easily. The Americans live in steam-boats, rail-cars, and stage-coaches, and hotels; so that I shall see them at home while travelling, and of their domestic manners ask freely of any one I meet. It is not necessary to give dates; no one will know when I arrived, when I departed, or how long I was in the country. Dates are awkward boys; they are constantly getting between your legs and throwing you down. I will give the whole a dash of democracy of the new school, being both anti-church and anti-tory in my opinion. I will talk of general progression—of reform measures—of the folly of finality, and so on. It will take, my dear boy; it will do. I shall go down as soon as any ultra-liberal of the day. I think I see the notices of it already."

We finish with a letter from an old hand, and full of old hand worldly wisdom:—

"My dear James,—Just as I was embarking, I received your letter requesting me to give you a full account of my voyage, and such hints as might be useful to you when you shall make the passage yourself. The first is unnecessary, for there is nothing to tell. Every man is alike, every woman is alike (they are more alike than the men, too much of the devil in them), every ship is alike, especially steam-ships, and the incidents of one voyage are common to all—'*Facies non omnibus una, nec tamen diversa*.' The company usually consists of young officers joining regiments; talk, Gibraltar, Cape, Halifax, Horse Guards, promotion, and sporting—of naval men; talk, insults to flag, foreign stations, crack frigates, round sterns, old admiral—of speculators; talk, cotton, tobacco, flour—of provincials; talk, Durham, Head, Colbourne, Poulett Thomson—of travellers; talk, Mississippi, Niagara, Mahone Bay—of women; talk, headach, amusements, and nonsense about Byron—of Yankees; talk, Loco Foco's go-ahead, dollars—of manufacturers; talk, steam, factors, and machinery—of blockheads, who chatter like monkeys about every thing. The incidents are common to all; fall on the deck—wet through—very sick—bad wine—cold dinner—rough weather—sight a sea, and a tureen of soup—spoke to a ship, but could not hear—saw a whale, but so far off, only a black line—feel sulky. There is nothing, therefore, to tell you but what has been told a thousand times, and never was worth telling once; but there are a few maxims worth knowing. 1st. Call steward, inquire the number of your cabin;

he will tell you it is No. 1, perhaps. Ah, very true, steward; here is half a sovereign to begin with; don't forget it is No. 1. This is the beginning of the voyage, I shall not forget the end of it. He never does lose sight of No. 1, and you continue to be No. 1 ever after;—best dish at dinner, by accident, is always placed before you; best attendances behind you, and so on. You can never say with the poor devil that was hen-pecked, 'The first of the tea and the last of the coffee for poor Jerry-y.'—*I always do this.* 2d. If you are to have a chum, take a young one, and you can have your own way by breaking him in yourself.—*I always do.* 3d. If the berths are over each other, let the young fellow climb, and do you take the lowest one; it is better he should break his neck than you.—*I always do.* 4th. All the luggage not required for immediate use is marked 'below.' Don't mark yours at all, and you have it all in your own cabin, where you know where to find it when you want it. It is not then squeezed to death by a hundred tons of trunks. If you have not room in your cabin for it all, hint to your young chum he has too much baggage, and some of it must go 'below.'—*I always do.* 5th. Don't talk French, it brings all those chattering, grimacing fellows about you.—*I never do.* 6th. Make no acquaintance with women, on many accounts; first, they have no business on board; and, secondly, they are too troublesome.—*I never do.* 7th. Never speak to a child, or you can't get clear of the nasty little lapdog-thing ever afterwards.—*I never do.* 8th. Always judge your fellow passengers to be the opposite of what they strive to appear to be. For instance, a military man is not quarrelsome, for no man doubts his courage; a snob is. A clergyman is not over-straightlaced, for his piety is not questioned,—but a cheat is. A lawyer is not apt to be argumentative; but an actor is. A woman that is all smiles and graces is a vixen at heart; snakes fascinate. A stranger that is obsequious, and over civil without apparent cause, is treacherous; cats that purr are apt to bite and scratch like the devil. Pride is one thing, assumption is another; the latter must always get the cold shoulder, for whoever shows it is no gentleman; men never affect to be what they are, but what they are not. The only man who really is what he appears to, is—*I always judge thus.* 9th. Keep no money in your pockets; when your clothes are brushed in the morning, it is apt—ahem—to fall out.—*I never do.* 10th. At table see what wine the captain drinks; it is not the worst.—*I always do.* 11th. Never be 'at home' on any subject to stupid fellows, they won't 'call again.'—*I never am.* 12th. Never discuss religion or politics with those who hold opinions opposite to yours; they are subjects that heat in hand-ling until they burn your fingers. Never talk learnedly on topics you know; it makes people afraid of you. Never talk on subjects you don't know; it makes people despise you. Never argue; no man is worth the trouble of convincing; and the better you reason, the more obstinate people become. Never pun on a man's words; it is as bad as spitting in his face: in short, whenever practicable, let others perform, and do you look on. A seat in the dress-circle is preferable to a part in the play.—*This is my rule.* 13th. Be always civil, and no one will wish to be rude to you; be ceremonious, and people cannot if they would. Impertinence seldom honours you with a visit without an invitation; at least—*I always*

find it so. 14th. Never sit opposite a carving dish; there is not time for doing pretty.—*I never do.* 15th. Never take a place opposite a newly-married couple. It is a great many things—tiresome, tantalising, disgusting, and so on.—*I never do.* 16th. Never sit near a subordinate officer of the ship: they are always the worst served, and are too much at home to be agreeable.—*I never do.* 17th. Never play at cards. Some people know too little for your temper, and others too much for your pocket.—*I never do.* 18th. There is one person to whom you should be most attentive and obliging, and every anticipate his wants. His comfort should be made paramount to every other consideration, namely, yourself.—*I always do.* There are many other corollaries from these maxims, which a little reflection will suggest to you; but it is a rule never to write a long letter.—*I never do.* Yours always,

“JOHN STAGER.”

From these specimens the new humours of our old friend, “Sam Slick,” may be appreciated; and if we add, that he is bitter enough upon Lord Montague, and ridicules the penny-post scheme, as far as puns and jests can be carried, we have done what is sufficient to enable the public to know the time o’day with the Clock-maker—the Democritus of New Brunswick.

#### WOOD ENGRAVING IN FRANCE.

[Second Notice.]

*Œuvres de Molière; L'Ingénieur Hidalgo, Don Quichotte de la Manche; Revue Générale de l'Architecture et des Travaux Publics; Balzac Illustré; La Peau de Chagrin.*

BEFORE we continue our remarks on *Don Quixote* and *Molière*, we will take occasion to speak of some illustrations of a rather different kind, although in their character and application closely allied to the other. The bank-notes in France, as all our readers who have had much intercourse with that country will have observed, are printed from blocks; not, as in England, from plates. In the turbulent days of the great revolution, the *assignats*, or paper-money for small sums, were issued in vast numbers, and it became necessary to have a great number of blocks of the same design, in order to multiply the impressions, with sufficient rapidity. No sooner, however, were they in circulation, than the dishonesty and cupidity of many persons led to numerous forgeries, and it became necessary to appoint a commission to consider the means of preventing this fraud upon the public. But on the first examination, it was found that the government itself had been the author of the first counterfeits; that among so many blocks, which were all copies from each other, there could not be found two which did not present some slight variation; and that, since the genuine *assignats* offered so many varieties, it was impossible for the public to distinguish the false ones. Various attempts were made to obviate the evil, which was finally effected by making metal casts from plaster moulds, which had been formed from original blocks. This was the first application of stereotyping to woodcuts in France. Among other processes which sprung out of these attempts, was the practice of engraving on blocks of metal—copper, for instance—as though they were blocks of wood, that is, by cutting away the parts which in the impression are to be white.

The title-page of the *Revue Générale* of Mr. Daly is a fine specimen of this practice of wood-engraving (if we may be pardoned the bull) upon copper. The *Revue* itself, a jour-

nal devoted to all the branches of architecture, archaeology, and engineering, is one of the most superb publications of the kind which has ever been attempted. Under the able management of Mr. Daly, its connexions are so widely established, that it may be looked upon as the organ of all the distinguished men in these branches of science in Europe and America. Besides numerous engravings, it also is embellished with woodcuts by the first artists in Paris.

The illustrated edition of Balzac's *Peau de Chagrin* is published by a very worthy and enterprising bookseller of Paris, M. Delloye, and does great credit to his taste. The embellishments are not woodcuts, but etchings on steel, which are printed in with the letterpress in a manner and with an effect that are quite marvellous. It is a beautiful publication, but we fear, as a speculation, it has not been very successful; for the expenses were very great, and required too extensive a sale to repay them. We think, also, that it was a mistake to publish a modern author in this form, and particularly such an one as Balzac. The book is certainly a gem in its kind.

We said in our last article that London booksellers had obtained stereotype casts of some of the French woodcuts, and have published or are publishing English editions. Such, we believe, has been the case with *Gil Blas*; but nobody has attempted an English edition of the illustrated *Don Quichotte*, and we wonder much at it, for it could not fail to have a very great circulation. We omitted to say in our last, that the portrait of Cid Hamet Ben-Engeli was the work of Brévière; the first cut in the opposite page, which represents the last scene of the adventurous life of the famous “*hidalgo*” of *La Mancha*, is another specimen of the workmanship of this engraver.

At the foot of the bed are the niece of Don Quixote and the “*Governante*,” with his redoubtable squire, Sancho Panza, on his knees beside them. The other group represents the curate and notary, with the bachelor Samson Carrasco. This cut is a favourable specimen of Brévière's talents: the cross-hatching is introduced with great freedom and effect.

The illustrations of *Molière* are all very clever. In comparing them with the general run of English woodcuts, we are continually struck with the superior manner in which the French engravers preserve, in their work, the originality of the design, with the expression of the head, and the style of the designer. The second cut, by the same engraver as the last, is taken from the sixth scene of the second act of the *Médecin malgré lui*. It needs little explanation: the “*médecin*” is pretending to examine the feigned *maladie* of Lucinde, whilst her father on the other side is listening with enthusiasm to his unmeaning explanations.

The third specimen we give is a cut from the *atelier* of Andrew Best and Leloir; it is one of the illustrations of *L'Avare*, one of *Molière*'s best comedies, founded upon the *Aulularia* of Plautus.

Harpagon the Miser intends to marry a young wife, and is preparing for the nuptials. The cut represents the scene between the miser and Frosine, an intriguing woman, whose aim is to obtain money from him; and she flatters him with the enumerations of his charms and accomplishments, and their all-powerful effects upon his intended bride. The miser is full of self-satisfaction, and contempt for those of the fair sex who can be so absurd as to love young men. Says the miser:—

“*Harpagon.* Pour moi, je n'y en comprends point, et je ne sais pas comment il y a des femmes qui les aiment tant.”

*Frosine.* Il faut être folle bête. Trouver la jeunesse aimable, est-ce avoir le sens commun? Sont-ce des hommes que de jeunes blondins, et peut-on s'attacher à ces animaux-là?

*Harpagon.* C'est ce que je dis tous les jours: avec leur ten de poule laitee, leur trois petits brins de barbe relevés en barbe de chat, leurs perruques d'étoques, leurs hauts-de-chausses tombants, et leurs estomacs débailés!

*Frosine.* Hé! cela est bien bâti, auprès d'une personne comme vous! Voilà un homme, cela; il y a la de quoi satisfaire à la vue, et c'est ainsi qu'il faut être fait et vêtu pour donner de l'amour.

*Harpagon.* Tu me trouves bien?

*Frosine.* Comment! vous êtes à ravir, et votre figure est à peindre. Tournez-vous un peu, s'il vous plaît. Il ne se peut pas mieux. Que je vous voie marcher. Un corps taillé, libre et dégaîé comme il faut, et qui ne marque aucune incommodité.”

The woodcut represents the two characters in the midst of this dialogue.

*The Fright.* By the Author of “*The Heiress*,” “*Nan Darrell*,” &c. &c. 3 vols. 12mo. London, 1830. Boones.

THE talent displayed by this author (a lady, we presume) has frequently called forth our approbation; and not unmitigated by some drops of allaying criticism, such as we observe has not discouraged her from proceeding on her pleasing course. The present work is not inferior to those which made the same pen popular. *The Fright* need frighten no novel-reader from the task of perusing her ill-favoured features. On the contrary, she is a sort of higher-classed female Smike, with an infancy of oppressions, hardly less painful from not being accompanied by physical wants, and with a better fortune in the end. She is altogether a rather interesting heroine, especially as she possesses every good quality under heaven. A misanthropical head of her family, her grand-uncle, is, we think, overcharged with bile;—a monster whom we detest throughout the whole story. A beautiful and vain sister is a fair contrast, and most of the other principal characters are cleverly drawn. The selfish Mr. and Mrs. Gunning; the worthy agriculturist, Bradley, with his managing wife and disagreeable children; the hero, the father and mother, and sundry lords and ladies, do justice to the observation and skill of the writer. There is a fault, and the most common one in the present state of novel production, which we would fain point out to the authors of these works. They do not develop their plots, nor make their actors speak as is seen and heard in life. Their Villains and Villainesses talk as men and women do not talk in society. They are plain, outright babblers, who declare their evil propensities, and warn their victims how ill they are going to use them, and what they intend to do. Now, this is not nature. Ill-minded persons are hypocrites: they conceal their thoughts and purposes; and it is only from their actions that you discover their designs. Look at the great Authors of Fiction, and you will see how finely they manage such matters; how almost imperceptible are the traces by which their plots are unfolded, and how little the words and deeds of their characters (and they are characters of the world) agree. Mrs. Bradley is an instance of this broad marking, instead of the delineation and pencilling which would belong to such an individual in actual existence. Thomas Rolleston, the misanthrope, we need hardly say again, is too fiendish for humanity; and the repetition of his selfish cruelties upon the daughter, which he had previously exercised for the destruction of the father, revolts us, besides having the blemish to be a twice-told tale.

Having noticed these things generally, we

content ourselves with adding a specimen of the writer's ability; which, though not of the foremost order, is yet sufficient for our day. When Trevyllian is ruined, and obliged to go abroad, two relatives agree to take charge of his two children, the Beauty and the Fright, and the narrative runs as follows. Mr. Bradley *loquitur* :—

"Trevyllian is but my second cousin once removed, or third cousin, or whatever it may be, for I never can understand those round-about genealogies, and I have a rising family of my own; but still I am quite ready to contribute as far as bad crops and low prices will admit. He was a fine young man when I last saw him, and though, to be sure, it was not very prudent to marry a girl with only three thousand pounds in the teeth of his uncle, his wife was such a sweet, pretty creature, that one could scarcely blame him; and we must not expect great wisdom at one and twenty. It would have been much better if he had taken a farm as I proposed, offering to assist him with my advice; but he had more taste for books than ploughs—admired the 'Æneid' more than the 'Georgics,' so there is no use in saying more about it, though I could have told him what Downing would turn out. Why the fellow did not know a drill from a harrow.' 'All the blame of that choice must rest with me,' said Rawdon, anxious to clear his friend in the judgment of one, who, if not the possessor of splendid talents, appeared to have a feeling heart. 'I suppose it must, since you say so, Captain Rawdon; for few take blame to themselves, when they can by any possibility fix it on another; but if not a good adviser, you seem a zealous friend, and that is as rare, or more rare and valuable, than a wise counsellor,' replied Mr. Bradley, completely won by the frankness of the warm-hearted soldier. 'But we must prove to Trevyllian that you are not his only friend. Eh, Mr. Gunning! Suppose we put down three hundred a-piece if they all go; or fit out Mrs. Trevyllian, and take the girls between us if they leave them behind, which will be the best plan, for India is a bad place for children. What say you?' 'Why really, Mr. Bradley, you take me by surprise;—I will consult with my wife and let you know the result; but we had money in Pinder's bank, which will never pay more than three shillings in the pound,' replied Mr. Gunning, who, generally slow, scarcely moved at all in the cause of charity, except when that charity was to be blazoned forth—bartered for an answering quantity of praise; and who was overpowered by Bradley's generosity. 'Come, come Gunning! You had but two hundred pounds in Pinder's bank, as I know for certain; and will receive ten shillings in the pound at least: besides, you have no children as I have, and nothing to fear from Swing, the fly, or the smut. Consult with Mrs. Gunning at once, whilst Captain Rawdon and I go into the next room. We should save Trevyllian all needless anxiety;—his loss is severe enough without any aggravation.' Mr. Gunning did consult with his lady, and the result of their consultation was a proposal to take one of the children, and advance two hundred pounds to their parents with the full understanding that they were to have complete control over their *protégée*, and were not to be called on or expected to give more at any future time, let what would occur. 'Mind, we take the eldest,' whispered Mrs. Gunning to her husband. 'She bids fair to be a greater beauty than her mother, and may marry into the peerage;—the other is a fright—and though two hundred pounds is a

great deal, by advancing that sum we shall get them out of the country, and poor relations are the plague of your life; always expecting you to be delighted to see them, even when they pop in, which they are sure to do, at the most inconvenient moment: and then always teasing you to get in a boy here, or a girl there; or to contribute to a birth or a wedding.' 'Very well, then, I will take charge of the youngest, who shall be brought up with my own children, and share all their advantages,' observed Mr. Bradley, on hearing the result of Mr. Gunning's conference with his lady, but unaccompanied by that lady's reasons. 'So now, Captain Rawdon, you can go and set Trevyllian's mind at rest, since you say he is not averse to the plan; and tell him that I shall call in an hour's time.' 'Averse to the plan?—I should think not!—it is far better than he could have expected;—a most excellent thing!' remarked Mr. Gunning, as he bowed Rawdon a second time out of his splendid drawing-room, but with rather more politeness than before. 'An excellent thing to be banished from England for ten years! burnt yellow with the sun—dyed blue with the indigo—parted from wife and children—perhaps both—working all the time to pay off a debt incurred by another, and then to begin the world again! Ventures, indeed! Will Mr. Gunning advance the capital? I hate that plausible man, and his fashionable wife, who would ride to the moon on a broomstick to get a bow from a lord,' said Rawdon to himself, as he proceeded on his way to Trevyllian. 'That Bradley is an honest, warm-hearted man, and I hope he rules at home, not his fine lady partner, who from what I hear is twin-sister to Mrs. Gunning, though the genealogists have not made out the relationship. Now to tell Trevyllian and his devoted wife that the best I can do for them is banishment and separation! I could almost wish that I had cut out my tongue, as Mr. Rolleston recommended long ago. And to think that that stern, vindictive man, with his Mephistophiles smile, is revelling in wealth! It is clear that this is a world of trial, not of retribution; and as we all deserve eternal torment, we must not grumble at temporary punishment.' 'What news, Rawdon?' asked Trevyllian, after shaking hands with his friend. 'I see you are freighted with great intelligence; half good, half evil, I should judge from your countenance. I have served a sharp though short apprenticeship to sorrow, and could now become a master in the trade. Speak out! Have you failed in your expected arrangement with Mr. Wood?' 'No; but I am sad at my own success. You shall hear and decide for yourself; only remember that you are not pledged to this indigo agency, and that I am as ready as ever to exert all my powers to procure you something more desirable.' 'I must go, though feeling all the pain of such a decision,' replied Trevyllian, when Rawdon had related every particular. 'I have no words to thank you for your friendly zeal; you have begged for me what you would not have begged for yourself. May God reward you—for I cannot! The agency is more than I could have expected;—but this parting!—my poor Grace!' he continued, turning away with a quivering lip. If Rawdon's feeling heart was pained by this emotion in his friend, how much more deeply was it wrung when he marked Mrs. Trevyllian with a face as pale as a marble statue, in which agony had swallowed up every other expres-

sion, clasp her children to her bosom with a convulsive shudder, as if she feared they would be torn away. 'It shall not be, Mrs. Trevyllian! it shall not be! I will sell my commission, and we will set off to Van Dieman's Land and make our fortune. I will beg, steal, do any thing—only don't look in that unearthly way,' exclaimed poor Rawdon, so shocked and bewildered at the agony expressed in the mother's countenance, that he was half beside himself with pity, and knew not what he was saying. 'I will go directly,' he added, rushing towards the door; and there is no knowing in what wild scheme he might have engaged, had not Trevyllian detained him. That Mrs. Trevyllian felt most acutely the parting with her children, even after she had subdued her anguish at the first idea, might be clearly seen in her quivering lip and swimming eye, when she looked upon them; and the suddenness with which she would sometimes catch them to her heart; but no murmurs increased her husband's pangs, and his gentle soothing was ever met by an attempt to smile, though such attempts were frequently more distressing than the most passionate burst of tears. To be with her husband was, to the devoted wife, to be not only where duty, but inclination called her;—to be with him was to be happy!—yet the scarcely less devoted mother might have found it difficult to decide on leaving her children, had the decision rested with her, which it did not;—the point was decided by others. A medical friend gave it as his opinion that Grace could not live six months in a warm climate; and that even Julia, though more robust, could not endure the heat of India for more than a year; whilst the Gunnings plainly declared that they would permit no change in the plan proposed. To submit, therefore, to what she could not alter, was the duty of this devoted wife and mother; and so well did she perform the painful task, that she increased the admiration of Rawdon and the affection of her husband."

Take the contrast of Mrs. Bradley :—

"She was one of that very numerous class of persons who 'strain at a gnat and swallow a camel.' An act unfitting a lady would have shocked her—a feeling unfitting a Christian was as a mote in her eye, unperceived, unfelt; or if felt or perceived, unheeded, as long as it attracted not the notice of others. The approval and disapproval of her own conscience was nothing to her;—she lived only in the opinion of the public; a polished selfishness was her distinguishing characteristic, though that polish was not always as perfect as she desired, owing to a naturally bad taste and worse temper. Not without natural affections, her duties as a mother were better performed than those of any other relation of life; but even here was discernible the vanity of one who sought the applause of the multitude more than the happiness of the object of her regard. There are show-houses, that, despite their splendour, convey no idea of comfort or happiness, but strike a chill to the observer: Mrs. Bradley was a show-woman—an ornament to a ball-room, for she had a good complexion, good features, and a good figure; all the attributes of beauty except its brightest, a winning expression; but the observer was not attracted by that irresistible something which, springing from the heart, has charms a thousand-fold more powerful than all the allurements of mere form and colour. Many admired Mrs. Bradley—none, save her own children, loved her;—strangers liked her—real friends she had not;—calculating selfishness being incompatible with

sincere affection. She was very anxious that her daughters should be highly educated, or rather, according to her definition of the term, highly accomplished. She wished them to play, sing, draw, dance, to perfection; but the education of the mind and heart—the instilling a holy and abiding principle on which all actions should be based, she did not understand, and therefore did not attempt. She too, like other mothers, speculated on the future;—she desired, she sought splendid matches for her daughters, careless whether such matches would promote their happiness; or rather considering splendour and happiness synonymous. She desired the same for her sons; let them be rich and admired, she little cared what evil passions they indulged, or on what erroneous principles they acted. Gild the apple on the outside, and she cared not if within it was dust and ashes. She had married Mr. Bradley because she considered it a good match; and she thought herself an exemplary wife because she performed the honours of his house, and regulated his establishment to her own admiration, if not always to the admiration of her visitors and servants. She certainly did look very well at the head of his table, which she took care should always be well arranged; but deferring to his opinion, when it clashed with her own, or making his happiness her first earthly object, formed no item in her list of a wife's duties."

These are examples which will, as they ought, bespeak a fearless reception for *The Frigate*.

## MISCELLANEOUS.

*Captain Marryat's America.* Vol. III.

THIS volume contains an able Essay on the State of Canada, and an Account of the Florida War, where the Americans are endeavouring to exterminate the Indians. The latter is a dreadful tale. The "Edinburgh Review" article concludes the volume; touching which we beg to refer to our preceding Numbers,—one giving the paper entire, and another exculpating Miss Martineau from having any hand in the Review so smartly answered by Captain Marryat.

*Innisfoyle Abbey; a Tale of Modern Times.*

By Denis Ignatius Moriarty, Esq. author of "The Wife Hunter," &c. 3 vols. London, 1840. Dolman.

To those polemical amateurs who are of opinion that the struggle between Roman Catholicism and Protestantism is not sufficiently discussed in pulpits, parliamentary debates, religious meetings, societies' tracts, pitched-battle controversies, itinerant proselytism, and newspapers, this production may be acceptable; as it takes up the question and treats it in a Novel way. From the name of Ignatius, we need not particularise on which side the cat jumps.

*Milman's Poetical Works.* 3 vols. 12mo.

London, 1840. Murray.

A NEAT and compact edition of the works of a fine classical, moral, and religious poet, for which the public are much indebted to Mr. Murray; for it has long been a desideratum with every reader of taste and feeling. The embellishments consist of a Portrait of the Author, and Views of Jerusalem and Antioch. All Mr. Milman's poems are contained in these volumes, and they are accompanied by some prefatory remarks and notes. Having paid them all the attention in our power on their separate appearances, we shall not repeat ourselves beyond offering the meed of our sincere gratitude for much delight, and high admiration

of themes, at the same time the effusion of virtue and genius.

## ORIGINAL CORRESPONDENCE.

To the Editor of the Literary Gazette.

## THE BIRTH-PLACE OF COLUMBUS.

THIS interesting historical question has been one of much controversy, especially within the state of Genoa,—where claims to the honour of having been the place of his nativity have been set up, with various degrees of plausibility, from highly probable, to almost baseless conjecture.

So strong was the controversy, and so loudly were the claims of the states of Placentia and of Piedmont urged, that at length the Genoese were roused to institute a severe and scrupulous inquiry; and a committee of the Academy of Sciences and Letters of Genoa was formed, in 1812, to examine the pretensions of all the claimants, and try to settle the question; the three commissioners named were the Signors Serra, Carrega, and Piaggio.

The claims of Placentia had been made as early as 1662, by Pietro Maria Campe. In the ecclesiastical history of that place, he maintained that Columbus was a native of the village of Pradello in its vicinity. The only result of the inquiry in relation to Placentia was, that the grandfather of Columbus, Bertolino Colombo, had a small property in Pradello, the rent of which had been received by the father of the discoverer, Domenico Colombo of Genoa, and after him by his sons, Christopher and Bartholemew; but no proof was given that either had ever resided on the estate: on the contrary, the proofs were that they all resided at Genoa.

There was more probability in favour of Piedmont; for it was shewn that, at the time of Christopher Columbus's birth, one Domenico Colombo was owner of the castle of Cuccaro in Monterrat. It was asserted that Christopher was his son, and that he was born at Cuccaro; and a claim was afterwards made, and a lawsuit instituted, by Baltasar Colombo, a descendant of this Domenico Colombo, for the inheritance of the discoverer when his male line became extinct. But the Council of the Indies, before whom this question was tried, decided against him. It was proved that the father of Christopher was resident in Genoa, both before and after the death of the lord of Cuccaro, who bore the same name.

The commissioners, after a long and diligent investigation, gave a voluminous and circumstantial report in favour of Columbus being a Genoese. This is corroborated by Peter Martyr and Bartholemew Las Casas, the contemporaries and friends of Columbus, and Juan de Barros, the Portuguese historian, who all reported of him, that he was a native of the Genoese territories.

But though Christopher Columbus was thus brought back to the territory, it by no means followed that he was born in the city of Genoa. Finale, Oneglia, Savona, and Cogoleto, towns on the coast of Liguria, in the Genoese states, each asserted him as their own.

For Savona strong claims were made by Giovanni Battista Bellero, an advocate of that town, in an ingenious paper which appeared in 1826; he therein charged, as an admitted fact, that Domenico Colombo was for many years a resident and citizen of Savona, in which place one Christopher Columbus signed a document in 1472. The name of Columbus was given to a square in Savona; the name of the "Jurisdizione di Colombi" was bestowed also, in honour of Columbus, upon that district of Liguria;

the name of Savona was given by Columbus to a little island adjacent to Hispaniola;—these are all atoms in the scale of evidence in favour of Savona: but his grand argument was based upon the testimony of Francisco Spinola, as related by Filippo Alberto Pollero, who stated that he had seen the sepulchre of Christopher Columbus in the Cathedral of Seville, with the inscription, "*Hic jacet Christopherus Columbus, Savonensis*." But, unfortunately for the Savonese, Christopher Columbus was not buried in the Cathedral of Seville, nor was any monument ever erected to him in that edifice. His son, Fernando Columbus, was buried there, and he bequeathed a noble library to that city; but as he was born at Cordova, the term *Savonensis* is as unreal as the tomb of the discoverer of America.

As affecting the other Ligurian claims, the name was a common one in the country, and this fact alone has been the foundation of many of the pretensions offered; but Cogoleto held out the strongest evidence, and, as Washington Irving, in his "Life of Columbus," says, "at one time bore away the palm:" it will be seen in the sequel that it has established its right to it, though Irving thinks that it has no other facts to rest upon than that one or both of the two of the admirals named Colombo, with whom the discoverer sailed, are stated "to have come from this place, and to have been confounded with him, so as to have given support to this idea." Washington Irving, after a careful inquiry, came to the belief that Columbus was born at Genoa.

Brockedon, in his "Passes of the Alps," did not let the question rest with Irving's opinion. In that part of his work which describes the Pass of the Cornice, which lay chiefly along the coast of Genoa, he describes his having had the house in which Columbus was born pointed out to him; and he says, "There is one spot, however, of great interest upon the route, the village of Cogoleto, which has the distinguished reputation of being the birth-place of Columbus. Its distance is about eighteen miles from Genoa. Whilst the author was resting at Cogoleto for refreshment, he was invited to visit the house, and even the chamber, in which the great discoverer was born. That the state of Genoa attaches belief to the evidence that this was the place of his nativity, is shewn in the fact that a civil officer, a *preposé*, is stationed here, a part of whose duty it is to shew the house to strangers. The following inscriptions painted on the front, in the Contrada Guiggiali, mark its situation, and point out its importance:—

I.  
' Con genero o ardir dall' Arca all' onde  
Ubbidente il vol Colombo preude,  
Corre, s' aggira, terren scopre, e fronde  
D' olivo in segno, al gran Noè ne rende.  
L' imita in ciò COLOMBO, ne s' acconde,  
E da sua Patria il mar solcando fende;  
Terreno alfin scoprendo diede fondo,  
Offerendo all' Ispano un nuovo Mondo.

Li 2. Dicembre, 1654.

PRETE ANTONIO COLOMBO.

II.  
' Hospes siste gradum: Fuit hic lux prima Columbo  
Orbe Viro majori: Heu! nimis arcta Domus!

III.

' Unus erat Mundus; Duo sunt, ait iste, fuerit.'

The window of the room in which it is said Columbus was born is at the back of the house, and looks out upon the sea,—upon that element whose unknown perils he afterwards encountered to gain an immortal reputation.

"In an able and very interesting inquiry into the birth-place of Columbus, by Mr. Washington Irving, in his 'Life and Voyages of Columbus,' recently published, he concludes that

Columbus was born in the city of Genoa. Mr. Irving admits, however, that at one time Cogoleto bore away the palm from other places which also claimed the honour of having given birth to Columbus. Mr. Irving's researches have invalidated all other claims except those of Genoa and Cogoleto; but his arguments have not removed the honour from the latter place. In a foreign country, every native of the little republic was a Genoese; and Columbus would have described himself as a Genoese, and not as a native of Cogoleto. Mr. Irving considers the strongest evidence in favour of the city of Genoa to be found in the declaration of Columbus in his will, executed in 1498, 'Siendo yo nacido en Genova.' I being born in Genoa. If this will had been written at Genoa, he might have said, I being born at Cogoleto; but, in Spain, where the locality of Cogoleto was unknown, he writes as a Genoese: even now, every wandering boy from the state of Genoa, without regard to the place of his birth, replies to the inquiry, Whence did you come? Genoa; and every native of the state, from Sarzanne to Ventimiglia, is a Genoese. In reply to one remark of Mr. Irving's, it may be said, that the great Andrea Doria, with as much patriotism as Columbus, and more power, never exercised it in favour of Oneglia, his birth-place, but of Genoa, his country. Mr. Irving mentions a codicil, executed by Columbus sixteen days before his death, in which he leaves a book 'to his beloved country, the republic of Genoa;' and he admits that one or both of the two admirals named Colombo, with whom Columbus sailed, was a native of Cogoleto; but the circumstance, also mentioned by Mr. Irving, of the preservation of the portrait of the great discoverer by the families who claim him at Cogoleto, is strongly in their favour. It is not pretended that this portrait represents any other than Christopher Columbus, the discoverer of America; and this fact, in connexion with the tradition which has through successive generations pointed out the house in which he was born, and upon which the above eulogies were painted nearly two hundred years since by a member of his family, goes far to justify the claim of Cogoleto to the honour of being the birth-place of Columbus.

This restoration of the honour to Cogoleto, which Brockedon has advocated, has just been confirmed by the discovery of a document of great interest—the will of Domenico Colombo; which will, made when Christopher was about twelve years old, is one of the most important facts yet contributed towards the settlement of the question.

The following is the notice and a copy of the will, given in a recent journal published in Genoa:—

*"Will of Domenic Columbus."*

"The will of Domenic, the son of Giovanni Columbus, of Cogoleto, who was the father of Christopher Columbus, the discoverer of America. The will was drawn up by Agostino Chiodo, a notary, on the 23d August, 1449; and is faithfully copied from a MS. in the possession of Captain Agnese. We publish it as a termination to our dissertation on the real birth-place of Columbus, printed recently in Pignerol at the press of Gighetti, and in which (p. 116) we have mentioned its date, and extracted a few words relating to the life of Domenic.

"In the name of Christ, Amen.

"In the year of our Lord 1449, in the eighth indiction, and on the 23d of August. Since nothing is more certain than death, and

nothing more uncertain than the hour of death, and it is better to live in the fear of death than in the hope of life to die a sudden death; and our Lord Jesus Christ saith in the Scriptures, 'Be ye ready, for ye know not in what hour the Son of man cometh,' and the mind of every prudent man should be prepared for death. Being heedful thereof, Dom. Domenic Columbus, the son of John, of this town of Cogoleto, by the grace of God and of the Blessed Virgin Mary, and of St. John the Baptist, sound in mind and speech, but not so in body, fearing the divine tribunal and unwilling to die intestate, hath directed me, the notary undersigned, to write this nuncupative will, dictated by himself in the presence of the undersigned witnesses.

"In the first place, when and whosoever he may happen to die, he hath recommended and doth recommend his soul to our Lord Jesus Christ, and to his most blessed mother the Virgin Mary, and the whole celestial body triumphant, directing that as soon as he shall be dead, his body be buried in the parish church of St. Maria, in the town of Cogoleto; to which church he bequeaths ten pounds of the money of Saone [Savonn], for his interment and his funeral.

"Item, the said testator gave to the said church, five pounds of the said money of Saone, for his soul by the love of God and the Virgin Mary, and for the remission of his sins.

"Item, he bequeathed to the chapel known by the name of St. John the Baptist, situated in the said parish church, two pounds of the said money for one mass to be celebrated annually on the 24th June, by the parish priest for the time being.

"Item, the said testator bequeathed to the building of the Porta Janna five solidi of Saone for his soul, and for the remission of his sins.

"Item, the said testator hath by his own mouth named, and doth name, Maria his wife, and the daughter of Jacobo Justi, of Ledra, in the town of Cogoleto, and hath declared and willed that during her widowhood, living honestly and without a second husband, she shall, during her life, use and enjoy all his goods, movable and immovable, to which he is now or may hereafter become entitled; that she shall live and remain in the usual dwelling-house of the said testator, with his heirs hereinafter named; and in case of her second marriage, then that she shall receive only two hundred pounds of Saone, which the said testator declares she shall take for her dowry.

"He hath named and doth name the absolute heirs of all the rest of his goods, Bartholomew, Christopher, and Jacob his youngest son, the legitimate and lawful children of the said testator, and of the said Maria his wife, to each of them an equal share in the whole. And he declares this to be his last will and nuncupative testament, which he wished to be fulfilled in all things; and if it cannot operate as a will, it shall operate as a codicil, or any other declaration of his will, and as a donation in the anticipation of death. And the said testator hereby revokes, annuls, and makes void and of no effect, all former testaments, last wills, and donations, in the anticipation of death by him made or executed, although there be contained therein, or in any thing arising therefrom, any words obligatory or derogatory to which special reference should be made *verbatim*, all which things he willed and declared should be hereby expressed and signified, this will alone remaining for ever valid.

"Of all which things the said testator requested me, the undersigned notary, to make his last will signed at Cogoleto, in the Contrade del Corroggio, in the room of the testator, he being in bed, and in the presence of the undersigned witnesses, all of the town of Cogoleto, who, after they themselves had heard the said will read, together with the said testator, subscribed the same with their own hands, after the testator and before me, the notary, who, after them, have affixed my common notarial seal, in witness and testimony of all things hereinbefore written.

"Dominicus Columbus, q. Joannis; Gregorius Riverolitus, q. Petri; Lazarus Ciarlus, q. Guilielmi; Nicolaus Agnesius, q. Joannis; Augustinus Pittamelius, q. Aloysii; Jacobus Poggius, q. Hyeronimi; Antonius Brussonius; Ambrosius Guastavimus. [The names of the fathers of the two last witnesses are wanting.]

'AUGUSTINUS CLAVUS, Notarius.

(I.S.) (AGOSTINO CHIODO, the Notary.)

"In the year of our Lord 1586, in the 18th indiction, and on the 24th day of October, I, the undersigned Antonio Chiodo, notary of Varago, (q.) at the instance (or q. in the presence) of Giovanni Baptista Spinula, and Gregorio Torre of Genoa, and Bernardo Colombo of this town of Cogoleto, declare that I possess the above testament, whole, perfect, and unaltered; and that I have faithfully transcribed it, without adding or omitting any thing which might alter the sense or meaning; and I have diligently and faithfully listened to the reading of the original, written and subscribed by the notary Agostino Chiodo; and since I find that both agree, I have fixed to this copy my notarial seal, in witness and testimony thereof.

'ANTONIUS CLAVUS, Notarius.

(I.S.) ('ANTONIO CHIODO, Notary.')

We think this document so fully establishes the true birth-place of Domenic Columbus and his wife and children, that every sensible person, unbiassed by that party spirit which always rejects the truth, will now admit the claim of the town of Cogoleto.

*Note.*—That this MS. was more than once cited by the Academicians of Genoa in their argument; and, beyond all doubt, if they employed it to prove the "nationality" of Columbus, we may also employ it to prove the precise place of his birth. A copy of this will is in the possession of Sig. Farmaciata (an apothecary), Canobbio; but it bears so little the character of an authentic document, and is so informal, that we must class it with those imperfect copies which, according to Pothier, at the most only indicate an original, and particularly when we mention that it wants the affirmation of the notary; that it is only subscribed by five witnesses, all of whom differ both in Christian and surname from those mentioned in our copy; and that in the body of the will the legacy to the chapel of St. John the Baptist, the seal of the notary, as well as the affirmation and notarial seal of the notary who copied it, and the date of the copy, are omitted.

B. W.

THE ANCIENT EGYPTIAN LANGUAGE.

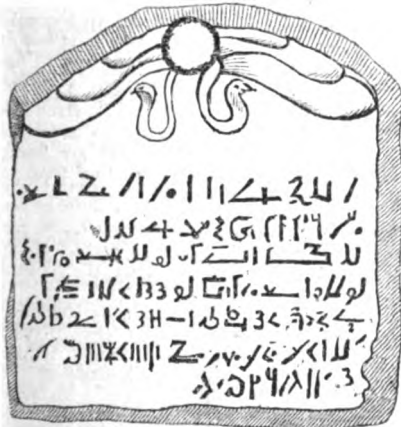

To the Editor of the Literary Gazette.

December 12, 1830.

SIR,—The zeal you evince in archæology induces me to lay before you some views of M. Robiano (who has recently published a volume on the Rosetta stone), as they seem to me to be borne out by several striking facts and coincidences. His object is to support the opinion that the ancient Egyptians spoke a *Semitic* dia-

lect. In maintaining such a position, he does not, however, pretend to say that the inhabitants of the Nile spoke *Hebrew* or *Chaldee*, such as was spoken on the banks of the Jordan or the Euphrates; but that the geographical position of Egypt, its relations with surrounding tribes, and, in fact, many monuments, give us reason to believe that at least the people of Egypt understood a language nearly allied to the Hebrew, or rather the Phœnician. If our researches among the surrounding nations prove that all these people spoke a *Semitic language*, it is more than probable that Egypt spoke one very similar; which, if not identical in its particular terms of phrase, was at least so in its fundamental principles. This supposition becomes more than probable when we consider that Egypt was bounded on the west by the Phœnician dialect of Carthage, on the south by the Ethiopians, and on the east by the Arab tribes and Palestine, all of them Semitic tribes. It can hardly, therefore, be supposed that the language should not present numerous affinities with those of its neighbours, which were often united by so many peculiar circumstances.

The discovery of an Egyptian funeral column, or cippus, with a demotic inscription, presented an opportunity of testing these opinions. This column is now in the Royal Museum of Turin, having on it an inscription of seven lines in Egyptian demotic characters, of which the subjoined is a facsimile:—

In examining this inscription with some attention, M. Robiano remarks, that the two first lines contain twenty-two different characters, and which consequently do not give any sense. He finds that the fourth and the twentieth, the eleventh and the nineteenth, are similar. Now the Semitic alphabet is composed of twenty-two letters, and the same letters in the Hebrew resemble precisely in the order of resemblance the letters in the inscription. Besides this, several other letters present an analogy to the Hebrew, whether curvate, or on inscriptions, or on medals.

Encouraged by this discovery, M. Robiano proceeded to make its application, feeling assured that it was impossible to make out a rational interpretation, if the idea which he formed of his alphabet was incorrect. In order to effect this, he wrote out the entire inscription in a single line, and without any separation: under each demotic character he placed its equivalent in the Hebrew character, and as soon as he could make out a word formed by these letters, he extracted it, and isolated it from the others. This separation gave him at first the words—*husband, com-*

*panion, afflicted, has prepared, raised; and at length completed the following inscription in Hebrew characters, and which may be compared letter by letter with the inscription on the column, with the exception of two signs not determined by the alphabet, and which M. Robiano reads according to the sense by כ, ק, and צ:—*

בטח רע שבך זור  
שבך כזעף שנלי ביה ע  
יילנש שוטה גיל כבל א  
בלית יל נודה יסע הפה  
בה ו חם עשה

"To my faithful companion, who perished, having unfortunately broken his legs (or shoulders), Kzaph, my husband:—Ilizth has placed a cenotaph. Also his daughter-in-law, from affection to her father-in-law, caused his body to be removed with pomp, has raised this cippus, and placed this enclosure around."

"A sense so regular," says M. Robiano, "so well sustained, so in harmony with the circumstances, appears to place beyond a doubt the fact that the language has been found in which it was conceived;" and he thinks it fair to assume that the people of Egypt spoke an idiom which differed but little from the Hebrew dialects with which we are now familiar.—Your obedient servant,

WILLIAM GOODHUGH.

#### ARTS AND SCIENCES. GEOLOGICAL SOCIETY.

JANUARY 8.—The Rev. Prof. Buckland, D.D. President, in the chair.—Two communications were read. 1. 'On the Carboniferous and Transition Rocks of Bohemia,' by Mr. Austed.—The south-east and south-west boundaries of Bohemia consist of two ranges of mountains, composed of gneiss and granite; and the latter rock is also exposed on the north and east. Of the sedimentary formations, a line drawn from Eger to Prague would separate completely those of a date newer than the coal measures from the carboniferous and transition systems; the two latter appearing only to the south of the imaginary line; and it is to them alone that the memoir refers. The district described by Mr. Austed is included within a triangle, having for its base the country between Luditz and Pilsen, and Prague for its apex; and the geological structure is explained by reference to a series of sections from Luditz to Pilsen, Rakonitz to Radnitz, Zebak to Ginetz, Przilep to Karlstein, and Pilsen to Prague. The formations thus intersected consist of gneiss, graywacke, coal measures, trap rocks, and accumulations of superficial *débris*. 1. The gneiss is exposed near Luditz, the eastern extremity of the great district composed of that formation and granite; and it presents a series of rounded hills, furrowed by the action of water and atmospheric agents. 2. The graywacke is extensively developed between Luditz and Pilsen, and the latter town and Prague, constituting the south-west and south-east boundaries of the great mass of the coal measures. It consists of slates, rotten shale, and bands of limestone; the lower beds being characterised by the frequent occurrence of *Trinucleus Caractici*. The strata are highly inclined, and much disturbed by faults. 3. The coal measures constitute patches of greater or less extent, resting unconformably on the graywacke; and are composed of beds of sandstone, shale, and coal, in general very slightly inclined; and the base of the whole series is a cherty sandstone resting upon a very coarse red conglomerate, which resembles some of the varieties of the old red sandstone of Here-

fordshire. The coal is worked principally near Pilsen, Przilep (whence Prague is supplied), Radnitz, and Swina. Of the age of these coal measures no doubt can be entertained, as their fossil plants, described by the late Count Sternberg, agree with those found in the coal fields of England. 4. The trap rocks are exposed near Manetin, Pilsen, Radnitz, Rokitzan, and Prague, and to their action many of the disturbances in the strata are ascribed. 5. The superficial *débris* occurs chiefly between Manetin and Pilsen, forming extensive barren tracts of gravel. The paper contains an account of the principal dislocations, particularly those between Rakonitz and Radnitz, by which the graywacke is five times placed on a level with the coal measures; and those between Przilep and Karlstein, by which the strata are completely inverted, and the older portion of graywacke made to rest upon the coal measures.—2. 'A Letter from the Rev. J. Gunn to Dr. Buckland.'—This communication was accompanied by three Paramoudras, or gigantic cup-shaped chalk-flints; and a series of specimens from the boulders found in the diluvial accumulations of Norfolk and Suffolk, and derived originally from strata belonging to the oolitic series. The letter contains, besides some observations on the tendency of Paramoudras to assume a tuberculated outline, where they are in contact with horizontal layers of flint, remarks on the vertical pipes or "sand galls" in chalk; and Mr. Gunn infers, from their being filled with only sand, gravel, or crag, that they were not formed during the eocene period. With respect to the boulder accumulations, he is of opinion that they were derived from the action of waves on ancient lines of sea-coast; and that the boulders themselves are the remains of the formations which, at one geological period, constituted the shores of the London basin.

#### ELECTRICAL SOCIETY.

TUESDAY, January 7.—At the last meeting, the arrival in the Downs of the ship in which the five gymnoti had been embarked at Berbice in October last for the Society was announced; but since then, unfortunately, the information had been received, that the eels had died during the voyage. The gentleman, however, who was importing them to present them to the Society, has taken measures to obtain other specimens.—A letter from Mr. G. Mackrell forwarding an economical voltaic battery, was read. The advantages of the arrangement on the principle of the constant battery, are extreme portability, simplicity, and cheapness. The total cost of construction was seven shillings. It consists of a wooden trough, twenty-two and a half inches long, divided by partitions of wood into twelve cells each, four and a half inches deep, four inches long, and one and a half inch wide, coated with pitch, covered over with shell-lac varnish. The zinc plates were placed in brown paper bags, and attached to the copper, which were arranged on the principle of Wollaston's battery. Mr. Mackrell's construction was exhibited in action. With the usual solutions of sulphate of copper and common salt, it produced one cubic inch of the gases in twenty-seven seconds from acidulated water of the strength generally used in voltmeters; heated seven inches of platina wire to redness; and evinced powerful electromagnetic effects. A voltaic battery, consisting of twelve pairs of zinc and carbon elements, as recommended by Mr. Cooper in the "Philosophical Magazine" for the present month, and constructed by Mr. Watkins, was also exhibited in action.

## BOTANICAL SOCIETY.

FRIDAY, 3d January. Mr. J. E. Gray, President, in the chair.—The largest seed-vessels of *Lecythis*, from South America, at present observed in Europe, was exhibited. Donations of specimens of rare *Fungi* were announced. Read, 'Notice of Indigenous Plants, observed on the Banks of the River Wye, principally in the Summer of 1839,' by Mr. Edwin Lees, who has for some years past paid considerable attention to the vegetation of that tract of country west of the "Severn," anciently under the dominion of the brave Silures. Last summer he examined in detail the course of the Wye, and the "notice" submitted to the Society was the result of his later excursions. He speaks in the highest admiration of the beauty of the scenery, enumerates a vast variety of plants, and describes their habitats. The reading of the paper will be concluded at the next meeting.

## LITERARY AND LEARNED.

## ROYAL SOCIETY.

ON Thursday evening, Mr. Lubbock presiding, the meetings were resumed after the Christmas recess.—A paper respecting the construction and use of single achromatic eye-pieces was read. After many experiments, carried on during four years, the author (name unheeded) is satisfied with the superiority of the single to the double eye-piece; the latter he considers only fit for those who view objects for entertainment. By a telescope with the single achromatic eye-piece, the discs of stars appeared entirely free from false light, and concentrate rings. Venus and Mars, too, were quite obvious under great disadvantages of vision. The author uses an eye-hole, the same as that in the Gregorian telescope.

LITERARY AND SCIENTIFIC MEETINGS  
FOR THE ENSUING WEEK.

Monday.—Medical, 8 P.M.; Geographical, 9 P.M.  
Tuesday.—Linnæan, 8 P.M.; Medical and Chirurgical, 8½ P.M.; Civil Engineers, 8 P.M.; Zoological, 8½ P.M.; Architectural, 8 P.M.; Society of Arts (Illustration), 8 P.M.  
Wednesday.—Society of Arts, 7½ P.M.  
Thursday.—Royal, 8½ P.M.; Antiquaries, 8 P.M.; Medico-Botanical (Anniversary), 8 P.M.  
Friday.—Botanical, 8 P.M.  
Saturday.—Asiatic, 8 P.M.; Westminster Medical, 8 P.M.; Mathematical, 8 P.M.

## FINE ARTS.

*Mr. Cattermole's Drawing of the First Reformers entering their Protest at the Diet of Spire, on the 19th of April, 1529.*

AT the present period, when religious topics are so generally agitated, and when such strenuous exertions are making by the professors of the respective persuasions into which the Christian world is divided, to obtain a preponderance, each for his own doctrine, a work so powerfully illustrative of the character and history of the founders of that class of Christians of which the great majority of the inhabitants of this country is constituted, is necessarily very interesting, and, we conceive, must become very popular. We know of no artist whose peculiar talents and attainments more completely fit him for the successful execution of such a subject than Mr. Cattermole. It was, therefore, with highly-raised expectations that we hastened the other day to the private view of the drawing, or rather the picture, the title of which stands at the head of this notice; and those expectations, we are happy to add, were fully realised. It is, in every respect, and without the least doubt, the able artist's

masterpiece. The following description of the scene we extract from the prospectus issued by Mr. William Walker, by whom this magnificent work, which has been above two years in hand, is about to be engraved:—

"The Diet of Spire, in 1529, passed a resolution essentially favourable to the Reformation, but which the pontiff, Clement VII., and his great coadjutor, the Emperor Charles V., determined to annul; for this purpose they summoned a second Diet at Spire in the spring of 1529. All the chief princes and deputies of the empire were present. King Ferdinand presided for his brother the emperor, then in Spain, and he contrived to procure a majority; the resolution, therefore, of 1526 was rescinded. But the Reformers now had gained sufficient strength not to be cast down by such proceedings: being denied a hearing in their defence, Luther and Melancthon drew up a protest, and, on the 19th of April, the Elective Princes in the minority again appeared before the Diet. This at first was also refused; but with great resolution they obliged the Diet to receive this their solemn protestation. In substance it declared, 'That they would not obey the tyrannical edicts imposing church-tradition before Scripture, because such was contrary to the law of God—that the Scriptures were the rule and touchstone of their conduct—that the Bible was the sole interpreter of itself to the conscience—and that they appealed to a General Council and to all unsuspected judges.' In the central group of the picture are the Elective Princes who thus stood boldly forward. John Constance, elector of Saxony, the chief leader in this event, brother and successor to Frederick, the late protector of Luther, is exhibiting to the king the protest, to which he, and those who surround him, had set their seals; on his right, Wolfgang, the prince of Anhalt, and Philip, the landgrave of Hesse; on his left, in front, George, margrave of Brandenburg, with the Dukes Ernest and Francis of Luneburg. Further to the right of the picture is Martin Luther, accompanied by his friends, Spalatine, Justus Jonas, and John Frederick, 'the Magnanimous,' are on his right; and on his left, Melancthon, Myconius, Bugenhagen, Bullinger, Bucer, and Eccolampadius, attended by deputies from the fourteen imperial cities who joined them. On the king's right, John Thomas, count Mirandula; the pope's legate, Cardinal Cajetan; and Albert, the cardinal and archbishop of Mentz; on his left, Joachim, elector of Brandenburg; William, duke of Bavaria; and Frederick, count palatine. The figure holding his hand above his eyes is John Faber, whom Ferdinand made Bishop of Vienna; behind him, Vergerio, Duke George of Saxony, and Henry, duke of Brunswick, resting his hand on the king's chair: the figure laughing in scorn is Charles Millitz. In the foreground to the left is the official, and in front of the Reformers, John Guttenburg's printed copy of the Scriptures."

We might dwell upon the skill with which so many figures (about eighty in number) are composed—upon the vigour and correctness of the drawing—upon the force of the light and shade—and upon the freedom yet solidity of the execution; but these qualities, however estimable, are all subordinate to that which is universally allowed to be the most difficult achievement of the historical painter—EXPRESSION. Of course, availing himself of the portraits of the distinguished characters of the piece which have been left us by Albert Durer, Holbein, Lucas Cranach, and others, Mr. Cattermole has communicated to their features and

action the various sentiment and passion by which, under such circumstances, they must necessarily have been influenced and agitated. Among many instances of this excellence, the bearing of Wolfgang, firm and energetic, without violence or exaggeration, is especially striking.

Mr. Walker has already etched the subject, preparatory to proceeding with it; and we were much pleased with an impression of the plate, even in its present state.

## NEW PUBLICATIONS.

*The Mellon Breakfast.* Painted by Francis Grant; Engraved by Charles G. Lewis. Hodgson and Graves.

EVERY body who saw it must recollect the clever original picture, painted by Mr. Grant for Rowland Errington, Esq., which enlivened the last Exhibition of the Royal Academy. It was justly said of it by that high authority in such matters, "The Sporting Magazine,"—"As a faithful picture of eleven of the best sportsmen in the world, as well as for its other merits, the *Mellon Breakfast* is a jewel. Mr. Grant has most judiciously grouped his figures. Had all been seated, many of their characteristics would have been concealed, and the formality of table arrangements would have marred the piece, while it would have failed to impart the true idea of the free and easy habits necessarily prevailing at such a place and such an hour. Time is evidently almost up, and the fixture is Billesdon." The following are the noblemen and gentlemen introduced:—Mr. Massey Stanley, Lord Wilton, Count Matusewic, Lord Gardner, Mr. Gilmour, Mr. Lyne Stevens, Sir Frederick Johnston, Lord Rokely, Lord Forester, Lord Kinnaird, and Mr. Rowland Errington. Mr. Lewis has shewn his usual skill in the engraving. The portraits are beautifully finished, but without detracting from the general breadth of the work.

*Portraits by the Count D'Orsay.* Mitchell.

Few members of the fashionable world deserve to be, and are, in every respect, so distinguished as the noble amateur, some of the productions of whose facile and elegant pencil are here presented to the public. They consist of the sketched portraits, *en profile*, of seven individuals; all of them, with one unhappy exception, enjoying just and extensive literary celebrity. We disclaim any knowledge of the exception (who must, however, we presume, be very proud of his associates), but of six of these spirited and finely executed drawings we are entitled to speak; and we confidently assert, that whoever has seen the highly-gifted originals cannot fail instantly to recognise the resemblances of Sir Edward Lytton Bulwer, Bart., Theodore E. Hook, Albany Fonblanque, Walter Savage Landor, Thomas Carlyle, and Richard M. Milnes, M.P.

*Illustrations of the Corporal and Spiritual Works of Mercy.* By a Sister of the Religious Order of Our Lady of Mercy. Part I. Dolman.

FOUR groups in outline, exemplifying the benevolent virtues of "Feeding the Hungry," "Giving drink to the Thirsty," "Clothing the Naked," and "Harbouring the Harbourless."

*Dramatic Sketches.* By R. I. Lane, A.R.A. No. VIII. Mitchell.

WE have frequently spoken of this work as one that was certain to command popularity, and the present number is of more than ordinary

interest. It contains six portraits, of which we shall only mention that of Miss Ellen Tree, in the character of *Clemathea*. The artist has taken one of the most pleasing positions in the play; and having caught the likeness, has produced a very charming lithograph.

*All Fours.* Painted by W. Hunt; Drawn on Stone by T. Fairland. Hodgson and Graves.

THE humorous design which amused the public so much at the last Exhibition of the Society of Painters in Water-colours. Mr. Fairland has been very successful in preserving the expression of the original; but we think a few smarter touches in the foreground would have told advantageously. The print is, whimsically enough, dedicated to the members of Crockford's Club!

*Picturesque Sketches of the Churches of Devonshire. No. 1.* Drawn from Nature, and on Stone, by W. Sprent. Ackermann and Co.

A PLEASING topographical publication.

*Panorama.*—Mr. Burford has produced another and a very beautiful panorama in his smaller room. It is a View of the Palace and Gardens of Versailles, on the fête of St. Louis, and has replaced that of the Colosseum, by substituting what is extremely gay and lively for what was very solemn and grand. Nothing can be more accurate than this representation. The play of the fountains, and the various groupings and costume of the people, render the whole picture as pleasing as any production of the kind we have ever seen.

#### ORIGINAL POETRY.

##### LUCY.

LET other bards in raptures sing  
Of Spanish and Italian graces,  
Their incense let them kneeling bring  
Before the shrine of foreign faces;—  
To distant climes I will not roam,  
Nor recant prove to love and duty;  
In vain I'd search, so far from home,  
For aught to match my English Beauty.

Fair is the soft Ausonian maid,  
And lovely is Iberia's daughter,  
When dancing in the chequered shade,  
As swan upon the moonlit water:  
And well the youth should guard his heart  
Who toys with them in myrtle bower,  
Or while he wreathes, with playful art,  
Their tresses with the orange-flower.

For in those tresses mischief lies,  
And from beneath those silken lashes,  
In every glance of those dark eyes,  
Love's amorous lightning fiercely flashes.  
And yet, though radiant as the morn,  
My English Beauty is still fairer;—  
Though Love's own cestus them adorn,  
My Lucy is a gem still rarer!

The graces of her form to trace  
In vain would baffled Art endeavour:  
Look only once upon her face,  
And you would wish to gaze for ever!  
Yet hath her cheek no rosy hue  
Like Summer when she goes a-Maying,  
Nor are her eyes, though softly blue,  
Twin violets with Zephyr playing:—  
For Summer's reign is quickly gone,  
And then the fairest roses wither;  
And violets, when Spring is down,  
Droop on their mossy bed together:—

But Lucy's cheek is ever bright,  
For there the rose is always glowing;  
Her eyes still sparkle with delight,  
There violets are ever blowing!

R. B. S.

##### SONNET.

##### TO THE EVENING STAR.

FAIREST of all the progeny of Night,  
On whose unparagoned, meek loveliness,  
The lingering sun now gazes with delight,  
As in the waves he cools each glowing tress:  
HESPER, thou dove-eyed herald, sent to bless  
The grief-oppressed heart with holy calm,  
To pour upon the bruised spirit balm,  
Softer than Lethe's famed forgetfulness:—  
Welcome! thrice welcome!—Still my raptured eye  
Thine advent hails as in the rosy prime  
Of boyhood; when, outstretched at curfew chime  
Upon the enamelled lawn, I watched on high  
Thee in thy beauty gliding with front sublime,  
Like to some white-robed angel, through the sky.

R. B. S.

##### ANACREONTICA.

##### III.

Ἐστὶ μαργαρίτας στρώματα,  
Ἐστὶ λαρύνας, κ. τ. λ.

SPREAD my couch,—I'll here recline  
Where myrtles with the lotus twine;  
Hither, Cupid, quickly fly,  
Round thy neck thy tunic tie;  
Hand me the cup that sparkles clear,  
To pledge a health to all that's dear.  
Rapidly as chariots roll,  
Life glides onward to the goal.  
This frame, when comes the fated day,  
To dust will crumble fast away!  
Then, why on stones waste rich perfume?  
Why vain libations on the tomb?  
On me—on me, your ointments pour,  
On my head your roses shower!  
Now call the mistress of my heart,  
Ere for Hades I depart.  
Gentle boy, to tell thee true,  
I mean to bid dull Care adieu.—R. B. S.

##### IV.

Διὰ τῆς ἰσχυρῆς  
Ἀλυσσούρας, κ. τ. λ.

As on my purple couch I lay,  
Dreaming the stilly night away  
(My cares by Bacchus lulled to rest),  
This vision bright my slumbers blest.  
Methought I flew on tiptoe light,  
In frolic race with virgins bright,  
While youths, as Bacchus fair and gay,  
With laughter eyed our sportive play;  
And many a quip and crank the while  
Went round with sly, malicious smile.  
With joy I woke:—the vision fair  
Now melted into empty air;  
And, tossing on my couch with pain,  
I sighed, in sooth, to dream again.—R. B. S.

##### THE DRAMA.

*Drury Lane.*—*Cupid's Diplomacy*, a slight piece from the French, is the only novelty of the week. It is very cleverly acted by Mrs. Stirling, as young *Louis XV.* courting a fair damsel (*Miss Montague*), in the disguise of an officer, and carrying her heart: Mr. Archer, Mr. W. Bennett, and Mrs. Selby, all in parts which suit them well. There is nothing of plot, but the affair is lively and pleasant enough to wile away twenty minutes before the pantomime.

##### VARIETIES.

*Musical Memo.*—Many persons imagine that no music can be composed without the aid of an instrument. Beethoven was deaf, yet he was the author of some of the most divine harmonies that ever were scored. A musical doctor of the present day—a countryman of our own—has been long bed-ridden; he has had a little table so constructed as to enable him to go on with his notation in bed. The doctor works with two pens, one in his right, the other in his left hand; with one he notes his bass, with the other his tenor, &c. It is very laughable to see him when the bass pen is dry, dip unconsciously the tenor pen, already full, into the ink-stand, or vice versa. This is continued sometimes for a minute, until the enraged musician, unable to contain himself longer, throws both pens away. Another musical genius of the present time, when composing, has been known to leave his table and deliberately dip his pen in the washhand basin. Both of these gentlemen compose "most eloquent music" without the help of any instrument.

*Politics in Periodicals below Par.*—It is a fact, that whilst all the other articles in the magazines are perused by thousands of persons in the coffee-houses of the metropolis, during the first two or three days of the month, the sheet containing the political article—Whig or Tory, no matter—is seldom cut until the third or fourth week, so little is it cared for. The newspaper seems to be the proper field for politics.

*Madame D'Arblay.*—The newspapers of yesterday announce the death of Madame D'Arblay at the advanced age of eighty-eight. The celebrated Miss Burney, author of those excellent novels, "*Cecilia*," "*Evelina*," &c., in which our fathers and mothers took delight, has thus passed away. In life she was most estimable, and never penned a syllable which had not a tendency to refine the mind and promote the cause of virtue.

"To find the Depth of a Mine by observing the beats of the Pendulum."—The force of gravity as we descend into the earth, does not vary by the law as it does when we descend towards the earth's surface from the regions above it. A person descending from the top of a high mountain, and making observations from time to time with a pendulum, would find the force of gravity increasing continually until he reached the level of the sea; if, then, he descended a deep mine, observing his pendulum, as before, from distance to distance, he would find the force of gravity, instead of increasing, to diminish continually. The reason of this may be explained as follows: let the earth's mass be supposed, when he has descended to any distance, to be divided into two parts—one a spherical shell, extending over the whole of its surface, and having for its thickness the depth to which he has descended, and the other a solid sphere included in this shell and filling it. Now it is a remarkable fact, that the attractions of the different elements of a spherical shell, of whatever thickness, upon a body, any where situated in the interior or hollow of the shell, exactly counterbalance one another; so that the body, being drawn in every direction alike, has no tendency to move in any one direction rather than another; and were the earth hollow, and its cavity a sphere, could we descend into it, we might float about in the void space, without any effort—every muscular exertion would, indeed, be a source of inconvenience and danger to us, and the principal anxiety of our lives would be to guard

ourselves against these continual collisions, upon the opposite walls of our prison-house, which each effort would tend to produce. Since, then, this shell of the earth above him exerts no attraction upon a person who descends into it, the whole force by which he is attracted must be that of the solid sphere which it encloses. Now this sphere, beneath him, diminishes its diameter perpetually as he descends; whilst his position remains, in respect to this lesser sphere, precisely the same as it was in respect to the greater, when he was at the surface; he may, in fact, be considered as standing continually, in his descent, on the surface of a diminishing sphere; being then attracted continually, under the same circumstances, but by a less quantity of matter, it is clear that he must be less attracted. It is found that this diminution of the attraction is exactly proportional to the diminution of the distance from the earth's centre; and applying this principle to determine the effect of the diminished attraction on the motion of the pendulum, we have the following rule to determine the depth of a mine. Observe the number of beats which the pendulum loses in one day, by being carried into the mine;  $\frac{1}{4}$ th, or nearly  $\frac{1}{4}$ th of that number of seconds, will give the depth of the mine in miles."—*Moseley's Illustrations of Science.*

"*The Principal Axis of a Body's Rotation.*—Suppose the fixed axis spoken of in the last article to become free, so that the body may move in any direction. Being pressed unequally in different directions, by the centrifugal force, it will then immediately alter its position, and the revolution will begin to take place about some other imaginary axis passing through the body; this again, in its turn, will give place to some other, and so on, until out of the infinity of axes, about which it may thus, in succession, be made to revolve, it falls upon one, about which the centrifugal forces exactly balance one another, and this axis, it will have no tendency to change. In every solid body there are three such axes, called its principal axes. They intersect in its centre of gravity, and are at right angles to one another. Although, when made to rotate accurately about either of its principal axes, the body has no tendency whatever to alter the axis of its rotation; yet its rotation may, or may not, when slightly deflected from that axis, tend to return to it; and it is of importance to know whether this will or will not be the case: for, practically, it is impossible by any impulse to cause the body, at the first instant of its motion, to rotate accurately round either of its principal axes; so that, when free, it cannot rotate round either of those axes, unless, of its own accord, the rotation tend to pass into it. Now of the three axes, there is only one into which the rotation thus tends of its own accord to pass, and it is the shortest of the three. If the body, being free to move, be put in motion, not round this or any other principal axis, its rotation will yet always tend to pass into this shortest axis, and will eventually settle into a rotation about it. Although generally, any body, whatever may be its form, has three principal axes of rotation, it yet may have more. Any diameter of a sphere, for instance, is a principal axis of rotation. Of a cylinder, the axis or line joining the middle of one of its circular ends to the middle of the other, is a principal axis of rotation, being the longest it can have; but any axis at right angles to this from its middle point, is also a principal axis, than which it can have none less. So in a prolate spheroid, a solid, which may be supposed

to be generated by an ellipse revolving round its greater diameter; this greater diameter is the longest principal axis of rotation, but any axis perpendicular to this from its centre is also a principal axis of rotation. These last axes are all of the same size, and are the body's least principal axes of rotation. In an oblate spheroid, which is generated by the revolution of an ellipse about its shorter diameter, this shorter diameter is a principal axis, and it is the shortest of the principal axes of the spheroid; whilst any axis at right angles to this, from its middle point, is a principal axis, and these are its greatest principal axes."—*Ibid.*

*Geology in Devon.*—Dr. Buckland and Mr. Conybeare have both listened to visit the late landslip on the coast of Devon, which, we understand, offers some very curious phenomena to the geologist, both inland and out at sea; where, at a considerable distance from the shore, a new solid ridge has been thrown up by this convulsion of nature.

#### LITERARY NOVELTIES.

Honest Schloss, our precious little Bijou Annual maker (on which such peculiar taste is bestowed), has this year had royal honours conferred upon him as a reward for his meritorious exertions. Her Majesty, in approval of her presentation copy, which was indeed beautiful and unique, graciously acknowledged the publisher's effort to please; and H. R. H. the Duchess of Kent, has appointed him her Printeller and Fancy Stationer. We rejoice in this, for it is a just reward for industry, perseverance, and desert.

*In the Press.*

A History of the British Sponges and Corallines, by Dr. Johnston.

#### LIST OF NEW BOOKS.

Observations on the Financial Position and Credit of the United States, by A. Trotter, Esq. 8vo. 15s.—The Christian Keepsake, 1840 (an United States Annual), 15s.—The Catholic Spirit of True Religion, post 8vo. 7s.—Bogatzky's Evening Treasury, new edition, 32mo. 1s. 6d.—May You Like It, by C. B. Taylor, 6th edition, fcap. 7s. 6d.—Temperance Emigrants: a Drama, by J. Dunlop, 18mo. 1s. 6d.—The Fortunate Family; a Tale, by Mrs. Streeten, fcap. 5s.—Young Christian's Sunday Evening, 3d series: On the Acts, by Mrs. Parry, 12mo. 6s.—Plain Sermons by Contributors to "Tracts for the Times," 8vo. 6s. 6d.—The Cotton Fields and Factories, by H. Brown, square, 2s. 6d.—Essay on the Life and Institutions of Offa, king of Mercia, by Rev. H. Mackenzie, 8vo. 3s. 6d.—Marian; or, a Young Maid's Fortunes, by Mrs. S. C. Hall, 3 vols. post 8vo. 11. 11s. 6d.—Sophia de Lissau, 5th edition, fcap. 5s.—History of Napoleon, by G. M. Bussey, illustrated by H. Vernet, Vol. I. royal 8vo. 21s.—Reminiscences of an Old Traveller, by T. Brown, 3d edition, 7s.—The Influence or Moral Effects of Poetry, by J. Corner, 12mo. 1s. 6d.—Family Prayers, by the Rev. T. Raven, 12mo. 3s.—Poems, by J. Sterling, 12mo. 6s.—Bishop Jewell's Apology of the Church of England, 12mo. 5s. (Oxford edition).—Laconics, new and cheap edition, 3 vols. 18mo. 1s.—Archbishop Hodson's Morning Discourses, 8vo. 3s.—Modern Poetry, 32mo. 2s.—Rev. W. Dalton's Family Altar, 5th edition, post 8vo. 6s.—Beauty of the Heavens, by C. F. Blunt, 104 coloured scenes, 2l. 2s.—Glimpses of the Old World; or, Excursions on the Continent, by the Rev. A. Clark, 2 vols. post 8vo. 14s.—An Essay on the Profession of Educator, post 8vo. 3s.—The Prosperity of Landholders not Dependent on the Corn Laws, by T. Jevons, 8vo. 2s.—Politilysis; an Historical Exposition of the Means by which Revolutions are to be Prevented or Effected, royal 8vo. cloth bds. 21s.

#### METEOROLOGICAL JOURNAL, 1840.

January.	Thermometer.	Barometer.
Thursday ... 2	From 51 to 41	29.61 to 29.62
Friday ... 3	... 35 ... 47	29.96 ... 29.88

Sunday ... 5	... 41 ... 30	29.77 ... 29.81
Monday ... 6	... 25 ... 35	29.84 ... 30.08
Tuesday ... 7	... 27 ... 19	30.14 ... 30.11
Wednesday 8	... 12 ... 30	30.05 ... 30.06

Prevailing wind, N.E.

Except the 5th and 7th, generally cloudy. Rain fell on the 2d and two following days; a little snow fell on the morning of the 6th.

Rain fallen, .2875 of an inch.

Edmonton.

CHARLES HENRY ADAMS.

#### TO CORRESPONDENTS.

"Fido" thanked, but declined.  
The Murder at Feversham (from Stowe) is not suited to our pages; the transcriber will find his MS. at our office.

#### ADVERTISEMENTS,

Connected with Literature and the Arts.

**KING'S COLLEGE, London.**—Department of Civil Engineering and Science as applied to Arts and Manufactures.

The Classes in this Department will be Reopened on Tuesday, the 21st January next.

Mathematics—Professor Rev. T. G. Hall, M.A.  
Natural Philosophy and Mechanics—Professor Rev. H. Mosely, M.A. F.R.S.  
Chemistry, Theoretical and Practical—Professor Daniell, F.R.S.

Experimental Philosophy—Professor Wheatstone, F.R.S.

Geometrical Drawing, &c.—J. Bradley, Esq.

Manufacturing, Art, and Machinery—E. Cowper, Esq.

Mineralogy—J. Tennant, F.G.S.

Practical Surveying—H. J. Castle, Esq.

Particulars may be obtained, upon application, at the Secretary's Office. J. LONSDALE, B.D. Principal.

December 21, 1839.

#### POST OFFICE REGULATIONS.

A LETTER NOT exceeding HALF AN OUNCE IN WEIGHT may now be sent from any part of the United Kingdom to any other part for ONE PENNY, if paid when posted, or for TWO PENNY, if paid when delivered. January 10th, 1840.

#### BOOKS IN THE PRESS.

On the 21st of January will be published,

**THE CHRISTIAN'S LATIN COMPANION**, containing Thomas à Kempis's Imitation of Christ, rendered into elegant Latin

By S. CASTELLIO.

And,

Hymns, with a Vocabulary, 3s.; without it, 2s. Black and Armstrong; J. Roulter.

Conduit Street.

**MESSRS. SAUNDERS and OTLEY** have nearly ready the following NEW WORKS:—

Records of Real Life, in the Palace and in the Cottage.  
By Miss H. Pigott.

II.

The Real and the Ideal.

III.

Camp and Quarters;

Scenes of Military Life.

By Major Patterson.

IV.

Social Life in Germany Illustrated.

By Mrs. Jamson.

V.

Family Records.

By Lady Charlotte Bury.

VI.

Timon; but not of Athens.

VII.

Arundel; a Tale of the French Revolution.

VIII.

Sir E. I. Bulwer's Works,

Beautifully illustrated in Monthly Volumes, price 6s. Vol. I. Rienzi; or, the Last of the Roman Tribunes. With Engravings from original Drawings by M. Cise and Crewick.

New Works now ready:—

IX.

Western India in 1838.

By Mrs. Postans, Author of "Cutch."

X.

Dr. Cumming's Notes of a Wanderer in Search of Health.

2d edition, revised and corrected.

XI.

Lady Chatterton's Rambles in Ireland.

2d edition, revised.

XII.

Major Hort's Rock of Gibraltar.

With numerous Drawings by Lieut. Laoy.

XIII.

The Sea-Captain; or, the Birthright.

By Sir E. L. Bulwer, Bart. 5th edition.

XIV.

What De Fellenberg has done for Education.

XV.

Lodge's Peerage for 1840.

Corrected throughout, from the Personal Communications of the Nobility.

XVI.

The Friends of Fontainebleau.

By Miss Burdon, Author of "The Lost Evidence."

XVII.

Max Wentworth; a Novel.

XVIII.

The Monk and the Married Man.

By Miss Julia Waddington.

Agents—For Ireland, J. Cumming, Dublin; For Scotland, John and Hamilton, Edinburgh.

On Monday, 13th instant, will be published,  
**THE FOREIGN QUARTERLY**  
REVIEW, No. XLVIII. price Six Shillings.

- Contents:—

- I.  
**Norway and the Norwegians.**  
By Robert Gordon Latham, M.A.  
Fellow of King's College, Cambridge.  
3 vols. post 8vo.  
II.  
**The Ingoldsby Legends.**  
By Thomas Ingoldsby, Esq.  
1 vol. post 8vo. bound, with illustrations by George Cruikshank.  
III.  
**The Sancy Jack and the Indianman.**  
By Lieut. Charles Peake, R.N.  
3 vols. post 8vo.  
IV.  
**Eleven Years in Ceylon.**  
Comprising Sketches of the Field-Sports and Natural History of that Colony, and an Account of its History and Antiquities.  
By Major Forbes, 78th Highlanders.  
3 vols. 8vo. with numerous illustrations.

- V.  
**Cousin Geoffrey, the Old Bachelor: a Novel.**  
Edited by Theodore Hook, Esq.  
Author of "Jack Hrag," "The Parson's Daughter," &c.  
3 vols. with Portrait of Mr. Hook.  
New Works just published:—  
I.  
**Sam Slick's Letter-Bag of the Great Western.**  
Post 8vo. bound, uniform with "The Clockmaker," price 10s. 6d.

- II.  
**Memoirs of the Court of England during the Reign of the Stuarts.**  
By J. H. Jesse, Esq.  
2 vols. 8vo. with Engravings from original Paintings.  
"The great mass of interesting matter to be found in these volumes will make them one of the leading publications of the season."—*The Times*.

- III.  
**The First Volume of the complete and illustrated edition of The Letters of Horace Walpole, Earl of Orford.**

- In 8vo. handsomely bound, price 15s.  
This edition, to be comprised in Six Monthly Volumes, will contain the entire Correspondence of Walpole, with numerous Letters never before published; forming an uninterrupted series from the Year 1725 to 1797, and including his Letters to—  
George Montagu, Esq.  
Sir Horace Mann  
Richard West, Esq.  
Lady Craven  
Gray (the Poet)  
Hon. H. Seymour Conway  
John Chute, Esq.  
Sir David Dalrymple  
Rev. William Mason  
Lady Hervey  
Lady Browne  
The Earl of Hertford  
Richard Bentley, Esq.  
Earl of Strarford  
Mrs. Hannah More  
David Hume, Esq.  
Countess of Alibour  
Captain Jephson  
George Canning  
Mr. Pinkerton  
The Misses Berry, &c. &c.

The whole now first collected.  
Richard Bentley, New Burlington Street,  
Publisher in Ordinary to Her Majesty.

**BOOKS PUBLISHED THIS DAY.**  
**THE EDINBURGH REVIEW, No. 142,**  
is published this day.

- Contents:—  
1. Sir John Malcolm's Life of Lord Clive.  
2. Douglas on the Philosophy of the Mind.  
3. Revenue System of British India.  
4. McCulloch's Edition of Smith's Wealth of Nations.  
5. Tytler's Illustrations of the History of England.  
6. Life and Discoveries of James Watt.  
7. Lord Roden's Committee on Irish Crime.  
8. Post-Office Reform.  
London: Longman and Co. Edinburgh: A. and C. Black.

**EARL OF RODEN.**  
**THE DUBLIN UNIVERSITY MAGAZINE** for January, price 2s. 6d. contains:

Confessions of Harry Lorrquere, Chapter 49, Munich: Chapter 50, The Tun at Munich: Chapter 51, The Ball.—4. The Oak's Death Song.—5. Recollections of a Portrait Painter, No. 5: Mrs. St. Aubyn.—6. Thaggee in India, and Ribandism in Ireland.—7. The Way we do Things.—8. Reminiscences of a Connaught Ranger. By Robert N. Fynn, Esq. M.A.—9. British America: The Edinburgh Cabinet Library.—10. The Dublin Evening Journal.  
Dublin: William Curry, jun. and Co.; Samuel Holdsworth, London; Fraser and Co. Edinburgh. Sold by all Booksellers in the United Kingdom.

NEW WORKS,  
Printed for Longman, Orme, and Co.

I.  
**LOITERINGS OF TRAVEL.** By N. P. WILLIS, Esq. Author of "Pencilings by the Way." 3 vols. 31s. 6d.

II.  
**THE STATESMEN of the COMMON-WEALTH OF ENGLAND.** With an Introductory Treatise on the Popular Progress in English History. By JOHN FORSTER, Esq. 5 vols. fcap 8vo. with Portraits, &c. price 6s. cloth, lettered.

III.  
**HENRY of GUISE; or, the States of Blois.** By G. P. R. JAMES, Esq. 3 vols. post 8vo. 31s. 6d.

IV.  
**THE GOVERNESS; a Tale.** By the COUNTESS OF BLESSINGTON. 2 vols. post 8vo. 31s. cloth, lettered.

V.  
**THE THEORY OF HORTICULTURE; or, an Exposition of the Physiological Principles on which the Operations of Gardening are conducted.** By JOHN LINDLEY, Ph. D. F.R.S. 8vo. numerous Woodcuts, 12s. cloth, lettered.

VI.  
**ELEMENTS of PRACTICAL AGRICULTURE.** By DAVID LOW, Esq. F.R.S.E. Professor of Agriculture in the University of Edinburgh. 3d edition, corrected, 8vo. with above 200 Woodcuts, price 15s. cloth, lettered.

VII.  
**LISTON'S ELEMENTS of SURGERY.** 3d edition, 8vo. with nearly 150 Wood Engravings and Three Plates, 25s. cloth, lettered.

VIII.  
**MACKENZIE'S PRACTICAL TREATISE on the EYE.** 3d edition, revised and greatly enlarged. 8vo. with above 100 Woodcuts, 25s. cloth, lettered.

NEW EDITIONS OF MRS. MARCET'S CONVERSATIONS.  
**NATURAL PHILOSOPHY; in which the Elements of that Science are familiarly explained, and adapted to the Comprehension of Young Pupils.** 8th edition, enlarged and corrected, with 22 Plates, 10s. 6d. boards.

**LAND and WATER.** 2d edition, revised and corrected, 1 vol. fcap. 8vo. 3s. 6d. cloth, lettered.

**VEGETABLE PHYSIOLOGY; comprehending the Elements of Botany, with their Application to Agriculture.** 2d edition, 1 vol. fcap. 8vo. 6s. cloth, lettered.

**POLITICAL ECONOMY; in which the Elements of that Science are familiarly explained, 7th edition, revised and enlarged, 1 vol. fcap. 8vo. 7s. 6d. cloth, lettered.**

**CHEMISTRY; in which the Elements of that Science are familiarly explained, and illustrated by Experiments.** 12th edition, enlarged and corrected, 2 vols. 12mo. with 18 Plates, 14s. boards.  
London: Longman, Orme, and Co.

Price 15s. Vols. I. and II.  
**L'EUROPE pendant le CONSULAT et L'EMPIRE de NAPOLEON.**  
Par M. CAPEFIGUE.  
Ouvrage écrit sur les Documents des principaux Cabinets de  
Dulan and Co. 37 Becho Square.

**NEW BOOKS just published by Mr. MURRAY.**

I.  
**Lord Mahon's History of England.**  
A new edition, 3 vols. 8vo.

II.  
**Milman's Poetical Works.**  
First complete edition, 3 vols. fcap 8vo. 18s.

III.  
**Correspondence of the Great Lord Chatham.**  
Vols. III. and IV. completing the Work. 8vo. 15s. each.

IV.  
**Austria.**  
By Peter Evan Turnbull, Esq.  
3 vols. 8vo. 34s.

V.  
**Arago's Life of James Watt.**  
Translated, with Notes, by J. P. Muirhead, Esq.  
8vo. 5s. 6d.

VI.  
**LIEUT. NEWBOLD'S ACCOUNT OF Penang, Malacca, and Singapore.**  
With Maps, 3 vols. 36s.

VII.  
**Hope's Essay on Architecture.**  
3d edition, with nearly 100 Plates. Royal 8vo. 2l. 2s.

VIII.  
**Hungary and Transylvania.**  
By John Paget, Esq. 88 Illustrations, 2 vols. 8vo.

IX.  
**Milman's History of Christianity.**  
2 vols. 8vo. Next week.  
John Murray, Albemarle Street.

APPROVED SCHOOL BOOKS.

I.  
**MRS. MARKHAM'S HISTORY of ENGLAND.**  
6th edition, 2 vols. 12mo. 12s.

II.  
**Mrs. Markham's History of France.**  
4th edition, 2 vols. 12mo. 12s.

III.  
**Mrs. Markham's Historical Conversations.**  
12mo. 6s.

IV.  
**Little Arthur's History of England.**  
By Lady Callcott.  
A new edition, 18mo. 2s.

V.  
**Stories for Children from the History of England.**  
11th edition, 18mo. 2s. 6d.

VI.  
**Gospel Stories for Children.**  
A new edition, 18mo. 3s. 6d.

VII.  
**Progressive Geography.**  
By the Author of "Stories for Children." 3d edition, 18mo. 2s.

VIII.  
**Conversations on Nature and Art.**  
By a Lady.  
8 vols. 18mo. 6s. 6d. each, bound.

IX.  
**Bertha's Journal while on a Visit to her Uncle.**  
3d edition, 18mo. 7s. 6d.  
John Murray, Albemarle Street.

**HAMILTONIAN SYSTEM.**  
"We recommend those who wish to acquire a knowledge of languages in the least time possible, to use the books arranged with interlinear translations, by J. Hamilton." The "Edinburgh Review" ascribes to the author of this system "the great merit of introducing translations made in invariable accordance with a strict verbal analysis; and it remarks, that 'it is this peculiarity which renders them such invaluable instruments to the learner.'" The following Books, on the Hamiltonian System, are published at Hunter's School Library, 131 Fleet Street:—

LATIN.	s. d.	FRENCH.	s. d.
Gospel of St. John	4 0	Elizabeth, Exile of St.	5 0

By W. C. TAYLOR, LL.D. M.R.S.A. Sec.  
of Trinity College, Dublin.  
London: Hayward and Son, 25 Paternoster Row.

### REVIEW OF NEW BOOKS.

*Marian; or, a Young Maid's Fortunes.* By Mrs. S. C. Hall, authoress of "Lights and Shadows of Irish Life," "Uncle Horace," &c. &c. 3 vols. 12mo. London, 1840. Colburn.

A NEW work from the pen of this charming authoress must be hailed with delight by the lovers of truthful and natural painting; and to such we would address our notice. To the revellers in supernatural horrors—unnatural characters (too good or too bad for every day, or even human life)—and impossible events, we can only say, if you run for such stuff to these volumes, you will be disappointed. There is no such trash in Mrs. Hall's *Marian*: her sketches of character are lifelike; her events probable; and the *dramatis personæ*, necessary to the progress and dénouement of the plot, brought together with perfect ease. Her locale, too, has a peculiar charm for us. We have a thousand times walked every step of the ground, and while we in memory retrace it, we will let the authoress speak for herself:—

"Katty's indignation at the mention of 'starving Irish' began simmering, but, at the word 'misery,' it instantly boiled over. 'Oh, my lady! I ask yer pardon for making so bold: distress may come upon any country—and I'd be sorry to say who brought it; but they'll have their reward, one way or other, that's all; but it would be a dale genteler to send the craythurs the money, without any blarney or bother about it: and, saving yer presence, ma'am, it's a bad example I'd be of misery, my lady.' Her portly and handsome appearance confirmed this, as her eye moved rapidly round the circle; and, seeing that she had 'the meeting' with her, she continued—'Thank God! I never felt misery myself, nor aint likely, while I'm with this good lady for a mistress, and sees so much beauty smiling at every side of me; and yerself, madam, to the fore, my lady, who has the larning of the wide world packt into yer head—may it never grow grey with sorrow, nor ache with pain.' 'Beautiful!—quite beautiful!' exclaimed Lady Bab, who vacillated from one whim or idea to another, unceasingly.—'Beautiful! My dear Mrs. Jones, you must send this nurse and child down to Lady Isabella's for change of air—and I shall learn Irish—and, oh dear! can you dance an Irish jig?' 'Faith, my lady,' replied the smiling nurse, 'many a one I danced to the music of my own heart; but that's been still so long, that it's ages since I covered the buckle!' The genuine feeling and poetry which the first part of this reply betrayed, moved even the placid Lady Isabel; for the first time she looked at the child, and tears gathered in her eyes: Katty saw it, and, with genuine good feeling, attempted to turn away. How mysterious it is, that, between the unlettered and the lettered, there frequently exist feelings of sympathy—self, and, as it were, simultaneously, created,—born and perfected within a moment,—which last as long as life exists, and are as unerring as they are unfathomable! Lady Isabella perceived that Katty understood her; and she remembered the Irish nurse and her infant charge long after they had faded from

the memory of her volatile sister. The point that struck Lady Bab in Mrs. Macane's reply was the name of the step. "Cover the buckle"—an Irish step—a real Irish step—delightful! Positively, Katty must dance it! exclaimed her ladyship. "Can anybody play 'cover the buckle'?" No; no one, of course, could play it. "Can you dance to no tune but that?" inquired Lady Bab. Poor Katty looked bewildered. A whisper was spreading through the rooms that Lady Barbara Hesketh had caught a wild Irish-woman, and was going to make her dance an Irish jig. Every variation of countenance and expression crowded the doorways—all interest for the 'dear!'—'sweet!'—'innocent!'—'lovely!'—'cherubic!'—'charming!'—'fascinating'—infant!—'creation!'—which had been declared to be like Lady This, Lord That, and Princess T'other (no one attempted to compare it to any untitled personage)—had vanished. People are always alive to their own amusement; and there was, it must be confessed, something very novel in the idea of a wild Irishwoman dancing a real Irish jig in a lady's crowded drawing-room. 'I can't, indeed, my lady—I can't,' said Katty, in an agony. 'See, what ur become of the babby?' 'Send it to bed—or, Lady Isabella, you will hold it,' said Lady Bab. 'The craythur would cry its two beautiful eyes out, my lady, if it was tuck from me. Pray, excuse me, my lady—some other time.' 'Can nobody play that tune?' persisted her ladyship, without hearing the expostulation, or seeing Mrs. Cavendish Jones's long face; for though the request did come from Lady Bab, Mrs. Jones saw it was very absurd. 'If you please, my lady, 'Cover the buckle' isn't a tune like 'Jig Polthougue,' or the 'Rakes of Malla,' or such-like; it's only a step,' said Katty, unwisely anxious to shew her knowledge. 'Delightful!' exclaimed Lady Bab. 'Then 'St. Patrick's Day in the Morning' would do as well.' 'It might be humoured, I'll not deny it; though I've heard many say it wasn't a born-jig.' 'Tell those miserable fiddlers of yours, my dear Mrs. Jones, to play 'St. Patrick's Day' directly.' 'Miserable! Lady Bab,' repeated Mrs. Cavendish Jones; 'I assure your ladyship they constantly play at Carlton House. I pay them enormously; and yet it is a favour to get them. I do not suppose they either could or would play any thing so common: I only engaged them for waltzes and quadrilles.' And, having so said, Mrs. Cavendish endeavoured to impart a dignified and offended expression to her thin features. Poor woman! she forgot herself: her temper got the better of her wisdom and of her politeness. What a restraint is politeness to selfish persons! Lady Bab laughed a contemptuous laugh. 'Really,' she said, 'you are quite a novice to be so imposed on: those men were never in a better house than this, depend on it. Hesketh, tell them to play 'St. Patrick's Day in the Morning.' The command was given in an imperial tone: the fiddlers tuned, or were tuning, when Katty curtsied again before the lady of the ascendant. 'If you please, my lady, to put it off; I couldn't dance it by meeself; and

it would take ever so long to insinse\* these gentlemen into it.' 'Oh, there is no necessity to incense them in any way,' said Lady Bab: 'this gentleman' (turning to the little fat Alderman Cooke) 'looks very like a picture I once saw of an Irish priest, and could dance it with you.' 'Many thanks, ma'am; but, indeed, the gentleman's a dale too sony to bother himself with dancin'; and, any how, I couldn't ent a step, barring it was on a door, or something that way—sorra a step I could do, my lady, forenint all this beauty and grandeur; it wouldn't be natural-like.' 'There's phraseology!' said Lady Bab, turning to her admirers, who, if truth must be told, were very hungry, and began to think that her ladyship exacted more homage than all the crowned heads of Europe put together. Still they played their play out to the last, and echoed, of course, her concluding sentence. 'We will take down a door!—oh! how delightful!—quite original!' she said, when the echo had performed to her satisfaction. 'Indeed, indeed, my lady, I can't!' said Katty, coming close to her ladyship, and speaking in a lower tone. 'Not a step could I handle at all. Sure I'd walk from this to Portingale on my hands and knees to do yer noble ladyship a sarvice; but it's not in my power to oblige your honour, you understand, on account of a—hardness I have in my fut.' 'A what, woman?—Speak out!' said Lady Bab, sharply. 'Why, thin, saving yer presence, my lady, since ye will have it (though God forbid yer ladyship ever should!) it's a corn in the heart o' my fut that's broke me entirely; and it was all the fault of that vagabone, Boneyparte—trapeeing after him, that murdered us all, and privedent the grate honour I should have had in dancing to plase ye, my lady—bad luck to him!' This confession was followed by a shout of laughter, in which Lady Bab joined; and, at the same time, the poor infant broke into a loud scream, which the 'whisht, a-lannan!—whisht, a-cushla!' of its nurse, failed to suppress; and Katty, to her great delight, was permitted to make a precipitate retreat. She ran up the stairs without any symptom of lameness; and without looking to the right or the left, rushed into the nursery, and seated herself by a table upon which a lamp was burning: in an instant the infant was resting on her lap, and she had thrown off its robe. 'Bad cess to the ruffles! Ah, jewel, war ye! my birden! and whisht!' she said to the still sobbing infant, as she pressed its small rosy foot to her lips. 'And was it yer toe I pinched, my precious, to get the squall out of ye? God forgive me!—that's a sweet one!'"

Again, and of another tone, is the following:— "He is not dead?" "No, my lord, not dead!" "Well, then, you can cure him, sir; you shall cure him." "If his wife would do as she ought, it might be possible—just possible, my lord, but she will not part with him; day and night does she sit beside him, listening to the ravings of his insanity—which are rendered a thousand times more painful by the consciousness that at times returns only with sufficient brightness to heighten the gloom."

\* "Make them understand."

There she is, apparently living without sleep, or air, or exercise, or almost food; existing, as if she were the soul, the active, living, thinking soul, which has been banished from that poor body, bestowing her all upon it—reserving for herself nothing but the hope that literally springs from her despair. They would not keep them in the lodging where I saw them at first, so she took a three-roomed cottage in a suburb,—a miserable detached thing, shaking in the blast, and only sheltered by green, unhealthy poplars; and there she waits upon and watches him; in his strongest fits her voice will soothe him; he was so seized this morning when I called—it was fearful; the person whom I had forced upon her, out of regard for her personal safety, could hardly keep him down; yet she took up her guitar—her poor eyes blinded with tears—her hand more nerveless and unstrung than the weak instrument. He did not heed the chords, but, when she sung—and sing she did, in that poor shattered cottage—she, whose voice used to be applauded to the echoes not long since, when she sung—his fingers ceased their fierce grapplings, his eyes by degrees returned to their humanity, he lay quite still—perfectly still; at last a moisture sprang to his heated eye-balls—she singing, my lord, all the time—tears burst on cheeks that were fever-flushed—still, my lord, that suffering woman sung—at last he turned his gaze on her. God! how her hands trembled then! In another moment he called her by her name, 'Margaret.' She did not rush to him as a thoughtless woman would, but dropped the instrument, still singing softly, then crept towards him, crawled on the poor bed whereon he lay, and, the paroxysm over, the maniac sobbed and cried upon that faithful bosom that loved him better a thousand times than in the hours of his prosperity."

The faithful, warm-hearted Irish nurse deserves a few lines to herself. She is, to our thinking, the true heroine of the story.

"Unlettered, yet not ignorant, her ideas, if conveyed in good authorised English, would have been considered worth remembering for their quaintness and originality, if not for their justness and propriety. She had looked at the world 'fore and aft;' she had married, like most Irish girls, for love, not prudence, and had remained, as (thank God!) so many of her countrywomen do, true and faithful to a man who was little better than a brute, for no other reason than that he was her husband. She had been with him in the Peninsula, returned with him to England, and buried him, to use her own phrase, 'dacent,' after watching his sick bed, and enduring his increased ill temper, for many months. He was a soldier; and it was during her wanderings abroad that Katty became acquainted with the mysteries of sundry 'made dishes,' which entitled her to the rank and reputation of a first-rate cook. Katty, moreover, was stern and honest; fond of humour, and gifted with a light yet tender heart. She was still in the prime of life; with a round joyous expression of countenance, and eyes sparkling, either in tears or smiles. Sometimes it was said they sparkled with more than natural spirit, but only she declared, 'whin she had the devil's own dinner and all to dress,' and no one with understanding to help her. What could she do but take a thimblefull, to keep up her heart? On such occasions it was her invariable practice to cry after her husband, who, according to her own account, must have been a gigantic monster, 'standing six foot three in his stocking-vamps, the pride of the regiment, and so fond of the army that he'd

fight with his own shadow, sooner than get out of practice. Yet,' she would add, with characteristic feeling, 'sure he had the first of my heart's love, and the last of it is in his grave.'"

Mrs. Cavendish Jones is a clever sketch, as also is General Peronett; but the whole production is so truly deserving of every praise, that we will not intrude longer, except to wish that all our readers may enjoy the gratification of reading it.

*Loiterings of Travel.* By N. P. Willis, author of "Pencilings by the Way," "Inklings of Adventure," "Melanie," &c. 3 vols. 12mo. London, 1840. Longman, and Co.

LIGHT and lively, Mr. Willis has here given us another very miscellaneous work, in which remarks on men and things, seen as he loitered about the world, poetical effusions, and a number of short tales of various character, form altogether a medley of pleasant gossipry and amusing reading. In his preface, he offers some reflections applicable to his preceding publications, which, in justice to them and the present volumes, we will also adopt as our introduction.

"I am free," he says, "to confess that no age interests me like the present; that no pictures of society since the world began are half so entertaining to me as those of English society in our day; and that, whatever comparison the living great men of England may sustain with those of other days, there is no doubt in my mind that English social life, at the present moment, is at a higher pitch of refinement and cultivation than it was ever here or elsewhere since the world began—consequently it, and all who form and figure in it, are dignified and legitimate subjects of curiosity and speculation. The Count Mirabel and Lady Bellair of D'Israeli's last romance are, to my mind, the cleverest portraits, as well as the most entertaining characters, of modern novel-writing; and D'Israeli, by the way, is the only English author who seems to have the power of enlarging his horizon, and getting a perspective view of the times he lives in. His novels are far more popular in America than in England, because the Atlantic is to us a century. We picture to ourselves England and Victoria as we picture to ourselves England and Elizabeth. We relish an anecdote of Sheridan Knowles as we should one of Ford or Marlowe. This immense ocean between us is like the distance of time; and while all that is minute and bewildering is lost to us, the greater lights of the age and the prominent features of society stand out apart, and we judge of them like posterity. Much as I have myself lived in England, I have never been able to remove this long perspective from between my eye and the great men of whom I read and thought on the other side of the Atlantic. When I find myself in the same room with the hero of Waterloo, my blood creeps as if I had seen Cromwell or Marlborough; and I sit down afterwards to describe how he looked, with the eagerness with which I should communicate to my friends some distinguished description of these renowned heroes by a contemporary writer. If Cornelius Agrippa were *redivivus*, in short, and would shew me his magic mirror, I should as soon call up Moore as Dryden—Wordsworth or Wilson as soon as Pope or Crichton. This is a great ado, you will think, O kind and considerate preface-reader, about a very small portion of the book; but other productions of mine in this vein having been reviewed as 'scandal,' I wish you to grant me that nothing ill-natured or re-

proachful—no scandal, in other words—could possibly spring out of the spirit in which I have written. As I said in a former preface, my first 'Pencilings' of living men and manners were written for my country-people only, and only they, I presumed, would ever hear of or be interested in them. They were sketched in the warmest admiration of the men of genius and the phases of society described. They had no pretensions. I would gladly have kept them the other side of the water. But after five years the book is still selling in fresh editions in England; and I am fated, very much against my will, to be best known out of my own country by my hasty and most trivial productions. I trust it will not always be so."

A portion of the first volume is occupied with England; and from its sketches we select a rather original view of our much-abused climate:—

"It is almost a matter of course to decry the climate of England. The English writers themselves talk of the suicidal months; and it is the only country where part of the livery of a mounted groom is his master's great-coat strapped about his waist. It is certainly a damp climate, and the sun shines less in England than in most other countries. But to persons of full habit, this moisture in the air is extremely agreeable; and the high condition of all animals in England, from mau downwards, proves its healthfulness. A stranger who has been accustomed to a brighter sky, will, at first, find a gloom in the grey light so characteristic of an English atmosphere; but this soon wears off, and he finds a compensation, as far as the eye is concerned, in the exquisite softness of the verdure, and the deep and enduring brightness of the foliage. The effect of this moisture on the skin is singularly grateful. The pores become accustomed to a healthy action, which is unknown in other countries; and the bloom by which an English complexion is known all over the world is the index of an activity in this important part of the system, which, when first experienced, is almost like a new sensation. The transition to a dry climate, such as ours, deteriorates the condition and quality of the skin, and produces a feeling, if I may so express it, like that of being glazed. It is a common remark in England, that an officer's wife and daughters follow his regiment to Canada at the expense of their complexions; and it is a well-known fact that the bloom of female beauty is, in our country, painfully evanescent. The climate of America is, in many points, very different from that of France and Great Britain. In the middle and northern states, it is a dry, invigorating, bracing climate, in which a strong man may do more work than in almost any other, and which makes continual exercise or occupation of some sort absolutely necessary. With the exception of the 'Indian summer,' and here and there a day scattered through the spring and the hot months, there is no weather tempered so finely that one would think of passing the day in merely enjoying it, and life is passed, by those who have the misfortune to be idle, in continual and active dread of the elements. The cold is so acrid, and the heat so sultry, and the changes from one to the other are so sudden and violent, that no enjoyment can be depended upon out of doors, and no system of clothing or protection is good for a day together. He who has full occupation for head and hand (as by far the greatest majority of our countrymen have) may live as long in America as in any portion of the globe—*vide* the bills of mortality. He whose spirits lean upon the temperature of the wind, or whose

nerves require a genial and constant atmosphere, may find more favourable climes; and the habits and delicate constitutions of scholars and people of sedentary pursuits generally, in the United States, prove the truth of the observation. The habit of regular exercise in the open air, which is found to be so salutary in England, is scarcely possible in America. It is said, and said truly, of the first, that there is no day in the year when a lady may not ride comfortably on horseback; but with us, the extremes of heat and cold, and the tempestuous character of our snows and rains, totally forbid, to a delicate person, any thing like regularity in exercise. The consequence is, that the habit rarely exists, and the high and glowing health so common in England, and consequent, no doubt, upon the equable character of the climate, in some measure, is with us sufficiently rare to excite remark. 'Very English-looking' is a common phrase, and means very healthy-looking. Still our people last; and though I should define the English climate as the one in which the human frame is in the highest condition, I should say of America, that it is the one in which you could get the most work out of it. Atmosphere, in England and America, is the first of the necessities of life. In Italy, it is the first of its luxuries."

From England, our author dashes off at once to Washington; and as, agreeably to his canons, the descriptions of that distant spot must possess most attractions for English readers, we shall turn to them for a few of our extracts.

"The paradox of 'the more one does, the more one can do,' is resolved in life at Washington with more success than I have seen it elsewhere. The inexorable bell at the hotel or boarding-house pronounces the irrevocable and swift transit of breakfast to all sleepers after eight. The elastic depths of the pillow have scarcely yielded their last feather to the pressure of the sleeper's head, before the drowsie is rudely shaken from his eyelids, and with an alacrity which surprises himself, he finds his toilet achieved, his breakfast over, and himself abroad to lounge in the sunshine till the flag waves on the Capitol. He would retire to his chamber to read during these two or three vacant hours, but the one chair in his pigeon-hole creaks, or has no back or bottom, or his anthracite fire is out, or is too hot for the size of the room; or, in short, Washington, from whatever cause, is a place where none read except those who stand up to a padlocked newspaper. The stars and stripes, moving over the two wings of the Capitol at eleven, announce that the two chambers of legislation are in session, and the hard-working idler makes his way to the senate or the house. He lingers in the lobby awhile, amused with the button-hole seizers plying the unwilling ears of members with their claims, or enters the library, where ladies turn over prints, and enfilade, with their battery of truant eyes, the comers-in at the green-door. He then gropes up the dark staircase to the senate gallery, and stifles in the pressure of a hot gallery, forgetting, like listeners at a crowded opera, that bodily discomfort will unlink the finest harmonies of song or oratory. Thence he descends to the rotunda to draw breath and listen to the more practical, but quite as earnest, eloquence of candidates for patents; and passes, after awhile, to the crowded gallery of the house, where, by some acoustic phenomena in the construction of the building, the voices of the speakers come to his ear as articulate as water from a narrow-necked bottle. 'Small blame to them!' he thinks, however: for behind the

brexia columns are grouped all the fair forms of Washington; and in making his bow to two hundred despotic lawgivers in feathers and velvet, he is readily consoled that the duller legislators who yield to their way are inaudible and forgotten. To this upper house drop in, occasionally, the younger or gayer members of the lower, bringing, if not political scandal, at least some slight resumer of what Mr. Somebody is beating his desk about below; and thus, crammed with the day's trifles, or the day's business, and fatigued from heel to eyelid, our idler goes home at five to dress for dinner, and the night's campaign, having been up and on his legs for ten mortal hours. Cold water and a little silence in his own room have rather refreshed him, and he dines at six with a party of from fifteen to twenty-five persons. He discusses the vital interests of fourteen millions of people over a glass of wine with the man whose vote, possibly, will decide their destiny, and thence hurries to a ball-room crammed like a perigord pie, where he pants, elbows, eats supper, and waltzes till three in the morning. How human constitutions stand this, and stand it daily and nightly, from the beginning to the end of a session, may well puzzle the philosophy of those who rise and breakfast in comfortable leisure. \* \* \* Some eccentric mechanic has presented the President with a sulky, made entirely (except the wheels) of rough-cut hickory, with the bark on. It looks rude enough, but has very much the everlasting look of old Hickory himself; and if he could be seen driving a high-stepping, bony, old iron-grey steed in it, any passer-by would see that there was as much fitness in the whole thing as in the chariot of Bacchus and his reeling leopards. Some curiously twisted and gnarled branches have been very ingeniously turned into handles and whip-box, and the vehicle is compact and strong."

As we have just seen a British Queen in procession to open Parliament, we may as well note how an American President performs the same ceremony, Mr. Van Buren, on succeeding General Jackson.

"The republican procession, consisting of the presidents and their families, escorted by a small volunteer corps, arrived soon after twelve. The General and Mr. Van Buren were in the Constitution phaeton,\* drawn by four greys, and as it entered the gate, they both rode uncovered. Descending from the carriage at the foot of the steps, a passage was made for them through the dense crowd, and the tall white head of the old chieftain, still uncovered, went steadily up through the agitated mass, marked by its peculiarity from all around it. I was in the crowd thronging the opposite side of the court, and lost sight of the principal actors in this imposing drama, till they returned from the Senate Chamber. A temporary platform had been laid, and railed in on the broad stair which supports the portico, and, for all preparation to one of the most important and most meaning and solemn ceremonies on earth—for the inauguration of a chief magistrate over a republic of fifteen millions of freemen—the whole addition to the open air, and the presence

\* "Made of the old wood of the frigate Constitution. It has a seat for two, with a driver's box, covered with a superb hammercloth, and set up rather high in front; the wheels and body are low, and there are bars for baggage behind; altogether, for lightness and elegance, it would be a creditable turn-out for Long Acre. The material is excessively beautiful—a fine-grained oak, polished to a very high degree, with its colours delicately brought out by a coat of varnish. The wheels are very slender and light, but strong, and, with all its finish, it looks a vehicle capable of a great deal of service. A portrait of the Constitution, under full sail, is painted on the panels."

of the people, was a volume of Holy Writ. In comparing the impressive simplicity of this consummation of the wishes of a mighty people, with the tricked-out ceremonial and hollow show which embarrasses a corresponding event in other lands, it was impossible not to feel that the moral sublime was here—that a transaction so important, and of such extended and weighty import, could borrow nothing from drapery or decoration, and that the simple presence of the Sacred Volume, consecrating the act, spoke more thrillingly to the heart than the trumpets of a thousand heralds. The crowd of diplomatists and senators in the rear of the columns made way, and the Ex-President and Mr. Van Buren advanced with uncovered heads. A murmur of feeling rose up from the moving mass below, and the infirm old man, emerged from a sick chamber, which his physician had thought it impossible he should leave, bowed to the people and, still uncovered in the cold air, took his seat beneath the portico. Mr. Van Buren then advanced, and with a voice remarkably distinct, and with great dignity, read his address to the people. The air was elastic, and the day still; and it is supposed that near twenty thousand persons heard him from his elevated position distinctly. I stood myself on the outer limit of the crowd; and though I lost occasionally a sentence from the interruption near by, his words came clearly articulated to my ear. When the address was closed, the Chief Justice advanced and administered the oath. As the book touched the lips of the new President, there arose a general shout, an expression of feeling common enough in other countries, but drawn with difficulty from an American assemblage. The sons and the immediate friends of Mr. Van Buren, then closed about him; the Ex-President, the Chief Justice, and others, gave him the hand in congratulation, and the ceremony was over. They descended the steps, the people gave one more shout as they mounted the Constitution carriage together, and the procession returned through the avenue, followed by the whole population of Washington. Mr. Van Buren held a levee immediately afterwards, but I endeavoured in vain to get my foot over the threshold. The crowd was tremendous. At four, the diplomatic body had an audience; and in replying to the address of Don Angel Calderon, the President astonished the gold coats, by addressing them as the democratic corps. The representatives of the crowned heads of Europe stood rather uneasily under the epithet, till it was suggested that he possibly meant to say diplomatic. \* \* \* \* \*

Aside from society, the only amusement in Washington is frequenting the Capitol. If one has a great deal of patience and nothing better to do, this is very well; and it is very well at any rate till one becomes acquainted with the heads of the celebrated men in both the chambers, with the noble architecture of the building, and the routine of business. This done, it is time wearily spent for a spectator. The finer orators seldom speak, or seldom speak warmly; the floor is oftentimes occupied by prosing and very sensible gentlemen, whose excellent ideas enter the mind more agreeably by the eye than the ear, or, in other words, are better delivered by the newspapers, and there is a great deal of formula and etiquetrical sparring which is not even entertaining to the members, which consumes time 'consumedly.' Now and then the Senate adjourns when some one of the great orators has taken the floor, and you are sure of a great effort the next morning. If you are there for time, and can sit, like Ahas with a world on your back,

you may enjoy a front seat, and hear oratory, unsurpassed, in my opinion, in the world."

We cannot undertake, in this review, to meddle with the little romances and tales which fill nearly two-thirds of these volumes. They are of all kinds, and shew much versatility of talent. The whole concludes with an epistolary journal during the last year in England, and a visit to the famous Eglintonn Tournament, from which we copy the following touching relation:—

"An eminent clergyman one evening became the subject of conversation, and a wonder was expressed that he had never married. 'That wonder,' said Miss P., 'was once expressed to the reverend gentleman himself in my hearing, and he told a story, in answer, which I will tell you; and perhaps, slight as it may seem, it is the history of other hearts as sensitive and delicate as his own. Soon after his ordination, he preached, once every Sabbath, for a clergyman in a small village, not twenty miles from London. Among his auditors, from Sunday to Sunday, he observed a young lady, who always occupied a certain seat, and whose close attention began insensibly to grow to him an object of thought and pleasure. She left the church as soon as service was over, and it so chanced that he went on for a year without knowing her name; but his sermon was never written without many a thought how she would approve it, nor preached with satisfaction unless he read approbation in her face. Gradually he came to think of her at other times than when writing sermons, and to wish to see her on other days than Sundays: but the weeks slipped on; and though he fancied that she grew paler and thinner, he never brought himself to the resolution either to ask her name or to seek to speak with her. By these silent steps, however, love had worked into his heart; and he had made up his mind to seek her acquaintance and marry her, if possible, when one day he was sent for to minister at a funeral. The face of the corpse was the same that had looked up to him Sunday after Sunday, till he had learned to make it a part of his religion and his life. He was unable to perform the service, and another clergyman present officiated; and after she was buried, her father took him aside, and begged his pardon for giving him pain, but he could not resist the impulse to tell him that his daughter had mentioned his name with her last breath, and he was afraid that a concealed affection for him had hurried her to the grave. 'Since that,' said the clergyman in question, 'my heart has been dead within me, and I look forward only. I shall speak to her in heaven.'"

Two or three bits from the Tournament, and we must close. Arrival at Ardrossan:

"A Gael, who did not comprehend a syllable of such English as a Yankee delivers, shouldered my portmanteau without direction or request, and travelled away to the inn, where he deposited it, and held out his hand in silence. There was certainly quite enough said between us; and, remembering the boisterous accompaniment with which the claims of porters are usually pushed upon one's notice, I could well wish that Gaelic tide-waiters were more common. 'Any room, landlord?' was the first question. 'Not a cupboard, sir,' was the answer. 'Can you give me some breakfast?' asked fifty others in a breath. 'Breakfast will be put upon all the tables presently, gentlemen,' said the dismayed Boniface, glancing at the crowds who were pouring in, and, Scotchman-like, making no promises to individuals. 'Landlord!' vociferated a gentleman from the

other side of the hall, 'what the devil does this mean? Here's the room I engaged a fortnight ago occupied by a dozen people shaving and dressing!' 'I canna help it, sir! Ye're welcome to turn 'em a' out—if ye can!' said the poor man, lifting up his hands in despair, and retreating to the kitchen. The hint was a good one; and taking up my own portmanteau, I opened a door in one of the passages. It led into a small apartment, which in more roomy times might have been a pantry, but was now occupied by three beds and a great variety of baggage. There was a twopenny glass on the mantel-piece, and a drop or two of water in a pitcher; and where there were sheets, I could make shift for a towel. I found presently, by the way, that I had had a narrow escape of surprising some one in bed, for the sheet which did duty as a napkin was still warm with the pressure of the newly-fled occupant. Three or four smart-looking damsels, in caps, looked in while I was engaged in my toilet; and this, with one or two slight observations made in the apartment, convinced me that I had intruded on the dormitory of the ladies' maids belonging to the various parties in the house. A hurried 'God bless us!' as they retreated, however, was all either of reproach or remonstrance that I was troubled with; and I emerged with a smooth chin in time for breakfast, very much to the envy and surprise of my less enterprising companions. There was a great scramble for the tea and toast; but, uniting forces with a distinguished literary man, whose acquaintance I had been fortunate enough to make on board the steamer, we managed to get places at one of the tables, and achieved our breakfasts in tolerable comfort."

Among the well-wet tilers, Mr. W. says:

"The Knight of the Dragon, who had been out to look after his charger, was being wiped dry by a friendly pocket handkerchief, and all countenances had fallen with the barometer. It was time for the procession to start, however, and the knights appeared, one by one, armed cap-à-pié, all save the helmet, till at last the hall was crowded with steel-clad and chivalric forms; and they waited only for the advent of the Queen of Beauty. After admiring not a little the manly bearing and powerful 'thwes and sinews' displayed by the array of modern English nobility, in the trying costumes and harness of olden time, I stepped out upon the lawn, with some curiosity to see how so much heavy metal was to be got into a demipique saddle. After one or two ineffectual attempts, foiled partly by the restlessness of his horse, the first knight called ingloriously for a chair. Another scrambled over with great difficulty; and I fancy, though Lord Waterford and Lord Eglinton, and one other whom I noticed, mounted very gallantly and gracefully, the getting to saddle was possibly the most difficult feat of the day. The ancient achievement of leaping on the steed's back from the ground, in complete armour, would certainly have broken the spine of any horse present, and was probably never done but in story. Once in the saddle, however, English horsemanship told well; and one of the finest sights of the day, I thought, was the breaking away of a powerful horse from the grooms, before his rider had gathered up his reins, and a career at furious speed through the open park, during which the steel-encumbered horseman rode as safely as a fox-hunter, and subdued the affrighted animal, and brought him back in a style worthy of a wreath from the Queen of Beauty."

"The Jester rode into the lists upon a grey

steed, shaking his bells over his head, and dressed in an odd costume of blue and yellow, with a broad-flapped hat, asses' ears, &c. His character was not at first understood by the crowd; but he soon began to excite merriment by his jokes, and no little admiration by his capital riding. He was a professional person, I think it was said, from Astley's; but as he spoke with a most excellent Scotch 'burr,' he easily passed for an indigenous 'fool.' He rode from side to side of the lists during the whole of the tournament, borrowing umbrellas, quizzing the knights, &c. One of the most striking features of the procession was the turn-out of the Knight of the Gael, Lord Glenlyon, with seventy of his clansmen at his back in plaid and phibeg; and a finer exhibition of calves (without a joke) could scarce be desired. They followed their chieftain on foot; and when the procession separated, took up their places in line along the palisade, serving as a guard to the lists. After the procession had twice made the circuit of the enclosure, doing obeisance to the Queen of Beauty, the Jester had possession of the field while the knights retired to don their helmets (hitherto carried by their esquires), and to await the challenge to combat."

To this we shall only add, that the Jester was not personated by any one from Astley's, but by M'lan, one of the best performers in his line upon the stage, and a very clever artist and accomplished fellow to boot in all situations.

#### WOOD ENGRAVING IN FRANCE.

[Third Notice.]

*Fables de La Fontaine.* (Illustrations by Grandville.) 2 vols. 8vo.—*Voyages de Gulliver.* (New Translation, with Illustrations by Grandville.) 2 vols. 8vo.—*Avantures de Robinson Crusoe.* (New Translation, Illustrations by Grandville, Baron, and Français.) 2 vols. 8vo. Paris, Fournier.

*Contes et Nouvelles de La Fontaine.* (Illustrations by Tony Johannot, &c.) 8vo. Paris, Bordin.

*Le Diable Boiteux, par Lesage.* (Illustrations by Tony Johannot.) 8vo. Paris, Bordin. We give above the titles of some of the more recently published works, which follow more or less in the train of "Gil Blas," Molière, and "Don Quixote." We believe that the greater number of the books here enumerated were completed in the course of the past year.

The illustrations of the *Fables de La Fontaine* are exceedingly beautiful, both as designs and as engravings. We think, indeed, that this is one of the best, if not the best, of all the French illustrated books. It is difficult to conceive a more elegant and entertaining present for young people. We give two specimens of the engravings. The first illustrates the fable of the bulls and the frogs. The two bulls are engaged in unflinching warfare on the border of the marsh; the stoical indifference of one of the frogs, quietly smoking his pipe of reed, and wondering at the emotion of his fellow-croaker, is admirably depicted; and not less so the impassioned gestures of the other, terror-struck with the presentiment that they must soon be trampled under the feet of the vanquished or of the vanquisher. In the distance we have a scene which brings home to us more strongly and vividly the moral of the story:—

"Hélas! on voit que de tout temps,  
Les petits ont pâti des sottises des grands."

The other cut which we give from this work, illustrating the fable of the villager and the serpent, is a remarkably good specimen of wood-engraving. The face and body of the villager,

and particularly the countenance of the child, are full of effect.

The *Tales of La Fontaine*, published by Boudin, is also illustrated by some very fine woodcuts. But the nature of this book renders it impossible that it should ever be popular in England; and the defect in its character which renders the text obnoxious generally to modern ears, makes the illustrations much more obnoxious to modern eyes. We are of course speaking with regard to the attempt to give this book the extensive circulation which alone can repay the expense of illustrating it in such a style. The designs that embellish La Fontaine's *Tales* are not so remarkable as those in many other similar publications; although bearing high names, yet they have not much originality, and a great part of them are little better than modifications of the pictures which adorned the older editions of the same work. The engraving in some of the woodcuts is very fine; several of them are by English wood-engravers; but we are inclined, on the whole, to prefer the style displayed in the French cuts.

The illustrated edition of the *Devil on Two Sticks* is an attempt to rival Paulin's "Gil Blas," and not without a considerable degree of success. The woodcuts, which are chiefly from the graver of Brévière, are very spirited, and the book merits altogether the popularity which it is likely to have.

It is somewhat singular that the French booksellers should have led the way in publishing illustrated editions of English standard authors, and even pointed out to us the choice we ought to make. *Robinson Crusoe* and *Gulliver* are both calculated to be popular books. *Gulliver*, in particular, is most profusely embellished with engravings; and, with the exception of one or two cuts, where the artist has carried out the ideas of the author, so as to trespass a little on the rules of propriety, those engravings are of a most attractive kind. There is, however, one drawback on the illustrations of *Gulliver* which strikes us. In the voyage to Lilliput, the difference in magnitude between the voyager and the people in whose country he is thrown, compels the artist to draw most of his figures on so small a scale that it is impossible to give them any degree of expression, and they look too much like the characters in a puppet-show—we mean, too much so to be repeated so often. This, however, is an objection which applies only to one portion of the two volumes. We believe that an English edition of *Gulliver* is in the press, with the French cuts. The two cuts on the preceding page, both taken from the voyage to Lilliput, will serve as specimens of the embellishments of this work.

#### LORD CHATHAM'S CORRESPONDENCE.

Vols. III. and IV. London, Murray.

WE introduced this very valuable publication to our readers on its appearance last week, and afforded it as much illustration as our time and limits would allow. The extracts we selected were striking, and curiously applicable to great questions of the present day; but we must now expatiate on a few other topics. The following letter is remarkably characteristic of a great potentate, and the state of our foreign affairs at the time:—

"Sir Andrew Mitchell to the Earl of Chatham."  
 (Private: for your lordship only.)

Berlin, August 21, 1768.

"My Lord,—Upon my arrival here, I took the earliest opportunity of making your lordship's compliments to the King of Prussia,

which were extremely well received; and he desired me to take the first proper occasion of assuring you of his esteem and friendship, as well as of the sense he had of your constant attachment and regard for him; and he concluded with saying, that he hoped your lordship would again be prevailed upon to take a share in government. I told him freely that I thought that period near at hand. The event has justified my prediction, and I hope his Prussian majesty will be more tractable and pliant whilst you are at the head of the administration. The high opinion he has of your lordship's honour and probity cannot fail to create a confidence, which may be greatly useful to the public. The duty of my station, as well as the affection I bear to you as a friend, oblige me to disclose to you some of the weaknesses of my hero. Great men have their failings; if they had none, they would be too much for humanity. His is that of vanity, and a desire, on every occasion, to have the lead, or at least to seem to have it. The first might be dangerous; the second, I mean the appearance of leading, may be yielded with advantage, in order to draw him into such measures as are really for his interest, but without shocking his vanity. To apply what I have said to the present case. Though I most heartily approve of the nomination of my friend Mr. Stanley, I could have wished that it had been kept in *petto*, till the King of Prussia had been consulted. I cannot doubt of his having approved of it, and that this mark of attention might have induced him to concur more readily in the great plan proposed. Besides, as that prince is naturally of a suspicious temper, he may imagine (notwithstanding all the assurances that can be given to the contrary) that Great Britain and Russia have already concerted this alliance between them without his participation, and that they mean to force him into it. If he should unhappily see it in this light, he will either not enter into it, or, if he does, he will never abide by it. Another circumstance which may serve to indispose him I shall mention to your lordship, and to you only; which is, that the nomination of an ambassador to the court of Russia, who is only to call upon him *en passant*, may make him jealous of the preference given to that court; for, though upon some occasions he laughs at all formalities, no man is more tenacious of them in whatever he thinks touches his rank, dignity, and consideration. I like extremely your maxim of *salvâ majestatem*: though it has not been constantly practised, I am persuaded your lordship will never swerve from it; and, therefore, I most sincerely wish that you may long remain at the head of affairs, to restore strength and dignity to the crown, confidence to the people, and respect and honour from foreign nations towards your native country. I ever am most affectionately, my dear lord, yours, &c. &c. ANDREW MITCHELL."

We inserted one letter to shew the firmness with which George III. supported his minister, and the confidence he reposed in him; the following is another interesting example of the intercourse between the crown and its servants:—

"The Earl of Bristol to the Countess of Chatham."

March 2, 1767.

"Madam,—I should make a great many excuses for taking the liberty of troubling your ladyship with a letter, but that I prefer this method of conveying the king's commands, which I was honoured with this morning to Lord Chatham, rather than to send a letter

directed immediately to himself, as your ladyship will be best able to judge of the proper time of making the communication to his lordship. His majesty ordered me to express, in the strongest and the amplest terms, his own steadiness and resolution to support Lord Chatham; that his majesty wished to infuse his own firmness into the breasts of those who grew apprehensive, and was convinced that, as soon as Lord Chatham's health would allow of his taking that active part he was persuaded his zeal prompted him to, but illness alone prevented, all the clouds which are now hanging over us would be dispersed, and the king had no sort of doubt but he would be able to assist with his advice as effectually as ever. His majesty said he wished to see Lord Chatham, if it was but for a quarter of an hour; that he would not talk upon business, but only wanted to have the world know, that he had attended him, for his own mind was not wavering; that he knew it was the same thing whether he opened the door of the closet at present to the opposition, or suffered those gentlemen to force it open: he was a prisoner and bound, whenever they set their foot within the closet; as for losing questions, that did not intimidate his majesty: he would stand his ground and be the last to yield, although he stood single. It would ill become me to add anything from myself, after delivering the royal commands. All my wishes are for the speedy recovery of my friend's health, that he may be confirmed in all I have made known to him, by the verbal assurances of the most amiable of masters. I am, with the most unfeigned respect, madam, your, ladyship's most obedient and most humble servant,"

"BRISTOL."

A very curious note (pages 368 et seq. vol. iii.) points out some extraordinary coincidences between a report of two of Lord Chatham's speeches (ann. 1770) in the MS. of Sir Philip Francis, and the "Letters" of Junius; and the inference is, that Francis was the author of these celebrated letters. We must, however, leave the controversy as we find it,\* and proceed to a different kind of illustration of Lord Chatham:—

While on a visit at Mount Edgcombe, Garrick received the following poetical invitation from him to visit Burton Pyssent:—

'Leave, Garrick, the rich landscape, proudly gay,  
 Docks, forts, and navies, bright'ning all the bay:  
 To my plain roof repair, primeval seat!  
 Yet there no wonders your quick eye can meet;  
 Save, should you deem it wonderful to find  
 Ambition cured, and an unpassion'd mind;  
 A statesman without power, and without gall,  
 Hating no courtiers, happier than them all;  
 Bow'd to no yoke, nor crouching for applause:  
 Vot'ry alone to freedom and the laws.  
 Herds, flocks, and smiling Ceres deck our plain,  
 And, interspersed, an heart-entwining train  
 Of sportive children frolic o'er the green;  
 Meantime pure love looks on, and consecrates the scene.  
 Come, then, immortal spirit of the stage,  
 Great nature's proxy, glass of ev'ry age!  
 Come, taste the simple life of patriarchs old,  
 Who, rich in rural peace, ne'er thought of pomp or gold."

We subjoin Garrick's answer:—

"David Garrick, Esq. to the Earl of Chatham.  
 Hampton, February 26, 1772."

"My Lord,—It has been said, that there is a charm in verses to cure many disorders. I was weak, and slowly recovering from a fit of the stone, when Lord Lyttelton sent me your lordship's favour; I am now well, and in the highest spirits: the only fear at present is, lest, from the peculiar force of the charm, they should rise beyond their proper pitch, and affect me another way. Indeed, my lord, you have put

\* See also Vol. IV. pp. 194-6, &c., and the fact similes.

my wits to a very severe trial, and it is some small compliment to them that my vanity has not overtaken them. The only excuse I can possibly make for not sooner acknowledging the great honour conferred upon me is, that I did not find my mind sufficiently settled to appear before your lordship. Though I am thoroughly humbled as a poet, and not a little as an actor (more inquiries being made after the verses addressed to me, than after Lear or Macbeth), yet still I think myself more obliged and honoured than I have words to express. Even you, my lord, cannot exert a greater spirit of disinterestedness and benevolence than you have done in my favour; for it is as impossible for your lordship to receive any additional fame by writing the best verses, as it is for me not to derive from them every honour and importance which my vanity or my ambition could wish for. I am, my lord, &c.

"D. GARRICK."

We pass to another of the matters singularly applicable to existing circumstances, the discussion of privileges of the House of Commons, and the printing of their proceedings:—

"The Earl of Chatham to Lieutenant-Colonel Barré.

Tuesday, 3 o'clock, March 36, 1771.

"My dear Sir,—I am extremely indebted to you for your obliging trouble, after a long fatigue yesterday. The scene is most interesting, and the day, as I expected, on a matter not sufficiently understood, somewhat disjointed. To me it seems that the only clue through the labyrinth is, that the house becomes flagrantly unjust and tyrannical the moment it proceeds criminally against magistrates standing for a jurisdiction they are bound to maintain, in a conflict of respectable rights. Nothing appears to me more distinct than declaring their right to jurisdiction, with regard to printers of their proceedings and debates, and punishing their member, and in him his constituents, for what he has done in discharge of his oath and conscience as a magistrate."

The immediate results are partly explained by the following:—

"John Calcraft, Esq. to the Earl of Chatham.  
Thursday morning, past one o'clock.  
March 28, 1771.

"My dear Lord,—After a stranger scene than what I had last the honour to inform your lordship of, the business is just ended in the lord-mayor's commitment to the Tower. The motion first proposed was, to the custody of the serjeant-at-arms, on account of his health. His lordship told the house he was much recovered, and desired to go to his honourable friend in the Tower. Mr. Ellis therefore moved the amendment of the Tower. I opposed the punishment on your lordship's ground; Mr. Phipps rose after me, and took much larger. He denied the principles on which the house had proceeded. Dysou answered us. On this question little else was said. There was a division of 202 to 39. Barré, Cornwall, and Mr. James Grenville went away before the division, in consequence of lord-mayor's last speech. The Rockinghamians in general absented; Burke, Sir George Savile, and some others, seceded. Previous to this, there was a debate on Ellis's motion on the breach of privilege; which lasted till eleven o'clock, but no division. In the course of it, Mr. Wedderburne was fully paid for his insolence, by Barré and Serjeant Glynn. The former dressed him with dignity, propriety, and great severity. Lord North disclaimed going out, though he wished much for ease and retirement. He added, that nothing but the

king or the mob, who were near destroying him to-day, could remove him: he would weather out the storm; but his pathetic manner and tears rather confirmed than removed my suspicions of his very anxious, perplexed situation.\* The concourse of people who attended lord-mayor is incredible. They seized Lord North, broke his chariot, had got him amongst them, and but for Sir William Meredith's interfering, would probably have demolished him. This, with the insults to other members, caused an adjournment of business for some hours. The justices came to the bar to declare they could not read the Riot Act, and that their constables were overpowered. The sheriffs were then called upon: they went into the crowd, attended by many members, and quieted them by five o'clock; when we proceeded on business. Mr. Ellis finished the evening by moving a select committee of twenty-one, to be chosen by ballot, to inquire into facts and circumstances relative to obstructions of the orders of the house. Mr. Wedderburne added a motion for an open one, to inquire into the causes of the present riots and tumults.† About ten o'clock the people again assembled, and are gone to the Mansion House with their magistrate. He goes from thence as soon as the Tower gates are open.‡ I must conclude, being really worn out; but am, in all situations, with the warmest attachment, your lordship's ever obliged, faithful, and affectionate friend,

JOHN CALCRAFT."

Other political affairs seem to prove that it is only the wheel running round, and that there is indeed nothing new under the sun.

In his private and domestic correspondence, the character of Lord Chatham shines forth resplendently; but we shall omit his loving epistles to find room for one of his son's, at the age of fourteen:—

"The Honourable William Pitt to the Earl of Chatham.

Pembroke Hall, October 15th, 1773.

"My dear father will, I hope, believe that nothing could make me more happy than his kind and pleasing letter, and is I trust assured, that its flattering contents must incite me to labour in manly virtue and useful knowledge, that I may be, on some future day, worthy to follow, in part, the glorious example always before my eyes. How ill-timed was the neglect of the post, that should damp with any degree of anxiety the rejoicings on the happy ninth of October! Our thoughts as ardently hailed the auspicious day, as your renowned western Luminary; who, I trust, by the next morning, though he sunk that night probably in a bowl of punch,

Had trick'd his beams, and with new-angled ore  
Flamed in the forehead of the morning sky."

Sunday being the day which he usually celebrates in the gold waistcoat. Lectures in

\* "In the course of his speech, Lord North expressed his conviction, that the mob who had attacked him were hired by the minority, to endeavour to effect without doors what they despaired of doing within. This brought up Mr. William Burke, who said that 'it was a falsehood, a most egregious falsehood; that the minority to a man were persons of honour, who scorned such a resource; and that the charge could only emanate from a man who was hackneyed in indirect measures.'"

† Mr. Wedderburne's motion was for a committee to inquire into the causes and occasion of the riots and tumults of the persons who assembled on Monday last, yesterday, and this day, in the avenues leading to this house, and attacked the persons of the members coming to attend their duty in parliament."

‡ "On the following day, Mr. Charles Fox complained to the house that the mob in Palace Yard had insulted him, broke the glasses of his carriage, and pelted him with oranges and stones, &c., and proceeded to complain of the conduct of the sheriffs; but the debate was put an end to by Lord North, who moved the order of the day, which was carried by seventy-five against thirty-one."

Quintilian will shortly call me away from the pleasure of writing to you; so that I shall be able to add but little more. You see by this, that I am now settled to business, and the tutors make a favourable, I fear a partial, report to the master; who has obligingly taken the trouble of hearing me himself, and, I trust, is not wholly dissatisfied. Health smiles on my studies, and a college life grows every day more and more agreeable. I received yesterday another most kind letter from Burton, for which I am infinitely obliged. I was very sorry to find that any thing of gont was felt, but I hope all those sensations are, before now, perfectly dispersed. I was in hopes to have had a few minutes to write to my dear mother, and thank her for her letter; but I find I must defer it till the next post. I therefore beg leave to trouble you with my duty to her, as well as love to brothers and sisters: many thanks to the latter for their obliging epistles; which I wish I had time to answer. I am, my dear father, your ever dutiful and affectionate son,

WILLIAM PITT."

William Pitt's accounts to his mother of his father's speeches, and the debates that followed on American questions, and to which he listened, are extremely interesting; but we must conclude, which we do with Lord Chatham's last letter:—

"The Earl of Chatham to the Duke of Richmond.

[From a draught in the handwriting of Lord Pitt.]  
April 6th, 1778.

"Lord Chatham presents his respects to the Duke of Richmond, and desires to express his best thanks for the great honour of the communication of the motion intended by his grace on Tuesday. It is an unspeakable concern to him, to find himself under so very wide a difference with the Duke of Richmond as between the sovereignty and allegiance of America, that he despairs of bringing about successfully any honourable issue. He is inclined to try it, before this bad grows worse. Some weakness still continues in his hands; but he hopes to be in town to-morrow."\*

Norway, and the Norwegians. By R. G. Latham, Esq. Fellow of King's College, Cambridge. 2 vols. 12mo. London, 1840. Bentley.

THESE sketches, drawn with a strong admiration of the country and people of Norway, are on the whole favourable to their social and political condition. Possessing the most democratic constitution of any European state, and rising rapidly, as Mr. L. assures us, in prosperity; he evokes greater attention to their habits, science, literature, and prospects, than has hitherto been paid to them, as belonging merely to a province of Sweden. It shall be our task to advert to the most novel portions, as specimens of the work; and as our pages have often been filled with Norwegian matter, we shall deem that sufficient without tracing the author's steps from place to place, and analysing or condensing his very desultory information. The style, it will be seen, is a little slapdashish;† National character is thus portrayed:—

"I said that the Norwegian farmer had somewhat of the obstinacy of the English one; I might have added, that he partakes also of

\* "On the 'morrow,' Lord Chatham appeared in the House of Lords for the last time."

† *Er. gr.* "Luckily our boatman speaks English (in a way), for devil of a sentence of Norse can either of us manage to tack together."

his prejudices. What a Norwegian says of a Swede, should be believed as little as what a Briton says of a Frenchman. The prejudice between the two nations runs incalculably high. When you are told that the Swedes are debauched and dissipated, believe it of the towns'-people only. If you hear that they are drunkards, tell your informant to look at home. You may have it instilled into you that they are deceitful; wait until you find them so. I write upon what I have heard from, not only impartial foreigners who have visited the two countries, but also from the more enlightened Norwegians themselves. That the Swedes are belied by their neighbours I have no doubt. They are the more energetic nation of the two, can do more work for less money, and undersell the natives in labour. What the Irish are to us, the Swedes are, in a smaller way, to the Norwegians. Hence bad blood between the frontier peasantries. There is a scuffle all along the borders every Sunday. Some Swedes came to catch lobsters at Laurvig; the Norwegians spoiled their tackle and bullied them off the coast. That Sweden has a despotic government, is her misfortune, less than her fault. No man has impugned the courage of the subjects of Charles XII. and Gustavus Adolphus. The graves of the Swedes are in the country of their enemies. A Dane or a German sometimes says, *Du pralende Normand* (Thou boasting Norwegian). Where there is smoke there is fire. The Norwegian spirit is not indifferent to the cause of freedom. They shamed the lukewarmness of greater nations in the enthusiasm with which they sympathised with the struggles of Poland. They crowded the quay to hear the earliest tidings, they gave a home to the refugees, and supported them with their purses. Their love to the Muscovite is in the inverse ratio to their sympathy for his victim. However, the Swedes are the pre-eminent haters of every thing Russian. Norway's detestation comes at second-hand. England should think well of Norway, for Norway thinks well of England. At least she did so in the days of Wessel; who blames his countrymen for confining their admiration too exclusively to themselves and England:—

'They deem that men can only come  
From England, or their own cold home.'

So sounds a song which criticises the national pretensions of all the nations of Europe, and winds up with the conclusion that good and bad are pretty equally distributed over all countries. One of three languages, German, English, or French (and often more), is sure to be understood by an educated Norwegian; and you soon find out, from their conversation, from which of the three literatures their information has been principally derived. Radicalism goes with the French, and a bankinging after things Danish with the German modes of thought. Of my own personal acquaintances, Wergeland was the most of a Gaul, and Daae of an Englishman. I said that one of these three languages was sure to be understood by an educated Norwegian. This does not mean that the knowledge of them is equal. French and English are about equally studied, German more than both put together. The Norwegian is more English than the Dane, and the Dane more German than the Norwegian. In Christiania they call a potato a potato, and in Copenhagen a *kartoffel*, after the English and the Germans respectively. The Swedes are as French as the Danes are German."

Of the Norwegian mode of life, a notion

may be formed from the author's description of their dietary. He says,—

"The Norwegians are not pre-eminently a cooking nation; their culinary operations are rather elaborate, as far as they go, than multifarious. They are also somewhat chronic in duration. I fancy that there is a good deal of superfluous work connected with them. For instance, they soak their game before it is dressed. But of this more hereafter. They reckon not their mode of cooking eggs by the hundred, and they delight not in a multiplicity of sauces. They stew not down whole sheep to make sauce for a single peacock. They have no essences with which you can eat your own father; or which, if dropped on the fingers, would tempt you to gnaw them to the bone. They have no vineyards, and their cellars scarcely make good the want of them. Their beer, like pneumonic creptations, is small. It is of a fine clear amber colour; but so are the waters of the Tiber and of the Tagus. What is called brandy is in reality whisky. It is made from either potatoes or corn. A great quantity of potatoes for this purpose are grown in the neighbourhood of Laurvig—*venenorum ferax*. The native produce, however, does not exclude cogniac. I think well of the Norwegian cogniac. I drank a good deal of it neat, as a preservative against the cholera. Their rum punch deserves all praise. It is best drunk cold. In summer-time you can have it iced, *punch à la glace*. In brandy-punch I have seen currant-juice mixed up."

"There is more claret than port, and more port than madeira. Drink red wine with your fish. Fish must swim three times—once in water, once in oil, and in wine. So says some one in Athenæus. The Norwegians adhere to this rule strictly, but I believe unconsciously. They make soup of salmon—very good eating. Ditto of eels—very good eating. Ditto of pig-meat, or pork—not such very good eating. Stall-fed animals are not the peculiar products of Great Britain, nor are fat beasts confined to the south of the Baltic. The swine, to be sure, are, in general, rather phthisical in their appearance than apoplectic."

As for the writer's own taste in feeding, we will not vouch it. He tells us,—

"If a red herring is to be eaten, as it ought to be, wave the ceremony of roasting it. Dried salmon is better for not having been near a fire. In English kitchens, a great deal of good heat is wasted. I once found a dried mutton-ham in a small posting-house after a long day's journey. The fashion is to eat such things *au naturel*. I did so, and enjoyed my meal. By far the best part of a Norwegian larder is the fish, the game, and the cheese. Small red trout from the mountain streams, stripling codfish, a salmon, and stock-fish, are the chief delicacies, whilst the chief sauces are of olive-oil. The flesh of the cock-of-the-wood is dark above and white beneath. This, with the ptarmigan and black grouse, is their chief game. I saw neither partridges nor pheasants. When meat is frozen, it is thawed by being put in cold water. The game flavour of a bird is no recommendation to a Norman. So much it is eschewed, that grouse, before they are dressed, are left for some hours in water to soak, and expel it. This is like acting 'Hamlet' with the part of the prince omitted; or the scenery of Richmond Hill without its wood and the river. Of course, nothing like *haut-gout* is tolerated. My friend and host, Mr. Archer of Laurvig, had a theory of his own upon this subject. He argued that the taste for high food, such as venison and

grouse, arose rather from necessity than from choice. That the Londoners set the fashion as to what was to be approved of in eating; that the Londoners got their grouse from a distance, during the hot weather, and therefore tainted; that they made a virtue of necessity, and professed to like tainted grouse from choice: that they extended their notions to other kinds of game on one side, and to the rest of their fellow-creatures on the other. The Russians, he added, who live at a distance from the sea, like high oysters—*dura messorum ilia*—whilst those that live nearer prefer them with the minimum of odour. When railroads are general, and a supply of fresher viands take place, the natural taste for scentless food (so prophesies Mr. Archer) is to return. Horace, who tells us that the ancients loved rancid bacon, tells us at the same time that they did not do so naturally, but that there was a reason for it:

'Rancidum aprum veteres laudabant, non quia nullus illis nasus erat, sed credo hæc mente,' &c.

Rein-deer venison is scarcely so good as that of the fallow-deer. It is dry even to parching and chipping. Rein-deer tongues, such as we eat in England, come from donkeys. I ate at Laurvig a lobster plain boiled and hot. Like Lord Chesterfield and his hunting, it is a thing a man should do but once. First catch your fish, then dry the flesh, then pound it to a fine flour, and with this fish-flour make a pudding. There are worse things in the world than a fish-pudding. It is a set-off to the *soupe au cochon*. With roasted mutton eat—not currant-jelly, but the preserved mountain-ash berries. If you wish to taste a cheese to which Cheshire, Stilton, and Gruyere, must yield the palm, go to Norway and ask for *gammel-ost*. If a second-rate one will suffice, ask for *mios-ost*. Now I would not be supposed to insinuate that there is no such thing as bad cheese in Norway. Far from it.

'O Norway cheeses, ye are like  
To Jeremiah's figs;  
The good were very good, the bad  
Too bad to give the pigs.'

The day before my departure from the country, I supped at Ny Hellsund, with the captain of the vessel that was to convey me. Native as he was of a county (Suffolk) where they use their cheeses as grinding-stones, the cheese to which we were that night condemned was too hard, too dry, and too sour even for him. *Gammel-ost* is made by mixing skim-milk boiled, with cream, or new milk, unboiled, and pressing it in a press of a certain antiquity; one that has pressed the cheeses not only of many seasons, but of many generations. The older this is, the higher is the flavour of the cheese. If new milk be kept until it becomes of a certain age (a month old or so), it grows curdy, and cheesy, and not disagreeably acid. This should be eaten with brown sugar and oaten biscuits. Many a traveller, during the heat of a summer's day, has wished for no more refreshing food than this, eaten in the clean dairy of a roadside farm-house, out of the smooth white wooden bowls in which it stands. Put a lump of sugar in the glass with your wine. It is a maxim, that good wine is improved by it, and that bad stands in need of it. I cannot say *experto crede*."

Of customs, the following are fair examples:—

"After dinner, it is usual for all the company to shake hands with each other, and return mutual compliments for the pleasure of their company during the meal. *Tak for Maden* (meaning, thanks for the meat), is the usual formula; it is said not to the host only but to all the company present. Little or no wine is

drank after dinner : during, however, that meal, a bottle stands between every second or third person, from which the company help themselves, or (if there be a lady next to them) their neighbour. There is no bowing, and drinking wine in the English sense of the word. An invitation to dinner means that the guest is not to stay for tea and supper, neither in Christiania nor in Copenhagen. The two meals are perfectly distinct, and require separate and special invitations for those that may partake of them. After dinner, coffee is served ; the host retires for a siesta, and the company disperse. At cards, the chief game is whist, and the savage custom (but lately exploded in England) of expecting the guests to leave money behind them to pay for the cards, and which is called card-money, is still kept up in Norway. It is not rude to smoke in a drawing-room, but it is creditable not to spit upon the floor. Think of this, ye transatlantic expectorators ! I have seen persons waltz with the pipe in their mouth, hanging over the lady's shoulder ; but such things form the exception rather than the rule."

Of the language, fine arts (yet in infancy),\* and popular literature of Norway, the author treats in his usual brief and unceremonious manner. We select a sample of the latter—the "Rustic Muses :"—

"The most popular of these, a song which you may hear chanted by two or three dozen carters at once, as they return home, not always wholly uninspired by beverages more strong than water, and lolling, like our own draymen (unfortunately not likely to be fined), upon the shafts of their rattling vehicles, is a series of verses, to a lively tune, and with meaning as follows :—

"*Og Kiøre Væ, og Kiøre Vand.*  
Then carry wet, and carry dry,  
And carry the reins apart;  
And carry who soever will,  
I carry my own sweetheart-o.  
The ruddy roses, and the eyes of blue,  
The pretty girls I hold myself unto;  
When I do wed, so will I choose;  
So is it pleasant for to live-o."

When, and by what village composer this tune was first made, is a point beyond the researches of an antiquarian. The bard, too, who indited the first verse of the poetry, is as unknown as are the predecessors of Homer. Such, however, is the measure, to which stanzas are composed periodically, just as events take place which call for the medium of verse, or lampoons have to be written between peasant and peasant. Some hundred such must have been sung at different times, and forgotten with the event which occasioned them. I heard one person repeat between twenty and thirty. The following is one of them, shewing that the partiality for gay regimentals is not confined to any particular country, and least of all to our own :—

"Not a college student will I have,  
That sits up and reads in his bed-o;  
But I will have an officer,  
With a feather in his cap upon his head-o.  
The ruddy roses, and the eyes of blue," &c. &c.

The student, however, is doomed to sigh in vain, only so long as he remains unbenedicted; although it must be owned that in the following stanza he is preferred to no very formidable rivals :—

"Neither clerk nor sexton will I have,  
That sits all the church-time a-yawning;  
But I will have a clergyman,  
With butter for his breakfast of a morning.  
The ruddy roses," &c. &c. &c.

The spirit of the song improves. There is less fastidiousness and more jollity. Scene—an ale-house :—

"As yet, there are no steel engravings in Norway, and as yet portrait-painting is in its infancy. Woodcuts, however, and lithographs, there are."

"Blessings on thy busy hands and feet,  
Heaven's blessings on thee, ancient mother;  
That takes our empty glass away,  
And brings a fresh one and another.  
The ruddy roses," &c. &c.

I spoke prematurely, when I denied the existence of pick-pockets in Norway. Hear the lamentation of a countryman who goes to town, and falls into bad company :—

"In Christiania I have been;  
I'll never go again to Christiania:  
There did steal my watch and seals,  
And pick my pocket of a new Bandana.  
The ruddy roses," &c. &c.

There is much more of this for such as love either to listen to, or to translate it. There is much also of a similar sort, to a different tune. Some are translatable. Others are too truly provincial to be so."

We will not meddle with Norwegian history, nor with its present constitution and religious divisions; and we are sorry that we cannot enter upon the list of its writers and their works. The following relates to periodical publications :—

"The newspaper press is well conducted. Very small matters indeed are notified to the public in them, such as the sales of things that, in England, would scarcely cover the advertisement duty. Debts of honour between man and man are sometimes published, equally for the information of the debtor and the world in general. Of your neighbour you must not speak too freely. There is a severe law of libel for the land, and a spirit, not abhorring litigation, amongst the people to enforce it. In a small society, like that of Christiania, every one's style is recognised. You may as well put your name to your writing as conceal it. Such papers as profess leaders at all have good ones. These are as well written and less personal than our own."

Of the increasing commerce of the country, Mr. Latham speaks; and, among other intelligence relating to it, states :—

"Nothing is wasted by the Norse fisherman. The very heads and offals of the cod have a use. Beaten up with some sea-weed, and mixed with a little hay, they serve as a mash for the Finmark cows, that not only manage to exist, but even to thrive, upon fodder so anomalous. Between 1815 and 1835, were exported (in round numbers) the following barrels of herrings :

1815 to 1819 .....	155,000
1820 to 1824 .....	307,000
1825 to 1829 .....	340,000
1830 to 1835 .....	517,000

Of lobsters, the following list :

1815 to 1819 .....	605,000
1820 to 1824 .....	927,000
1825 to 1829 .....	1320,000
1830 to 1835 .....	784,000

A single lobster costs in Norway about 1½d. A trifling duty is laid upon them when they leave the country. The London market has the chief monopoly of them. There is good cod-fishing off Shetland; but the Norwegian can undersell the Shetlander, because his tackle is cheaper, and he fishes with nets. • • • • • The lobster-season is the winter. Then do they bite best.

In June they are no longer caught. Such as are taken, are taken in weirs, or lobster-pots; as eels are taken in eel-pots. These are laid in the water, with small fish by way of bait; and the lobster that enters to devour finds himself unable to get out again. They are purchased before they are caught. Lobsters yet unborn are forfeited to the salmon-eaters of London. • • • • • They pass the time between their capture and their embarkation in flat tanks, pierced with a multitude of small holes, lying off the neighbourhood of Læurvig, half sunk and half afloat. In this manner they pass

weeks and even months. Those that were caught first have a double time to wait. They remain in limbo, as patriarchs among their fellow-captives. The Norway lobsters are rather smaller than our own. Some of them are of light-blue colour. Occasionally they are found of monstrous hues. In such cases one side is black and the other white. These, however, are rarities. They fight among themselves, and have their claws pegged to prevent them. This is not as it ought to be. It is as easy a matter to tie them up. Besides this, it is more statutable. That lobsters be not pegged, is provided by an act of parliament. It might be thought that fish would, when thus confined, starve themselves into an atrophy. They are naturally voracious; but during the time of their confinement eat nothing. Still they shrink less than might be supposed. An accurate hand may, however, tell the duration of their imprisonment from the lightness of their flesh. Females (with spawn) remain so, no *accouchemens* taking place. Before they are shipped from Norway a small export-duty is paid. Such as are dead when they reach London are thrown into the river. It is illegal to land them. Besides Læurvig, Christiania and Bergen have a large share in the lobster-trade."

With this we conclude, and leave to readers a book altogether amusing enough, and giving the latest news of Norway.

#### MISCELLANEOUS.

*The Monk and the Married Man.* By Julia Rattray Waddington, author of "Misrepresentation," "Janet," &c. &c. 3 vols. 12mo. London, 1840. Saunders and Otley.

"EVERY thing in its proper place" is a good old maxim, and one brought forcibly to our minds whenever we see a novel made the vehicle of religious *pros* and *cons*. We think our authors, like another writer in the same vein noticed in our last Number, unfortunate in her choice of a subject, and yet more so in the execution, and are fain to confess we have had some difficulty in following her to the end of her third volume. On one point, however, we are rather disposed to agree with the fair writer; viz. in the conversion of the hero, a bigoted Roman Catholic. Who would not become Protestant, or, maybe, Jew (any thing but infidel), when tempted by the bright eyes and ruby lips of a Clara Montgomery?

*The State of Religion and Education in New South Wales.* By W. W. Burton, Esq., one of the Judges of the Supreme Court, &c. 8vo. pp. 311; Appendix, pp. 136. London, 1840. Cross; Simpkin and Marshall.

A LABORIOUS and statistical view of the rise and progress of the various religious persuasions which divide this colony; the result of which is an earnest appeal to the friends of the Church of England at home to extend their support to it.

*Grecian Stories*, by Maria Hack. Pp. 352. (London, Harvey and Darton.)—We have in this Number mentioned another juvenile production, extremely well adapted for the purposes of instruction for which it has been written; and we have much pleasure in being able to speak very favourably of this neatly ornamented and judiciously interesting volume, which throws distinct lights upon many interesting events in the ever-didactic history of Greece.

*Sure Method of Attaining a Long Life*, &c. by Lewis Cornaro. Pp. 124. (London, Highley.)—Every body is so desirous of length of life, that the well-known story and maxims of Cornaro (the great-grandfather of all Temperance Societies) have reached a 38th English edition.

*The Englishman's Library*.—Vol. I. Clement Walton; or, the English Citizen, by the Rev. W. Greasley, M.A. Lichfield. Pp. 212. Vol. II. Scripture History Familiarly Illustrated, by the Hon. and Very Rev. H. Howard, D.D. Dean of Lichfield. Pp. 318. Vol. III. The Parable of the Pilgrim, by Simon Patrick, D.D. Lord Bishop of Ely.

(compressed edition.) With Introduction and Life of the Author. Pp. 259. Vol. IV. *A Help to Knowledge, in Extracts from the most Approved Writers, Systematically Arranged, and Adapted to be read as a Continuous Treatise*, by the Rev. T. Chamberlain, M.A. Pp. 100. (London, Burns.)—These four neat and cheap volumes offer the soundest moral and religious inculcation, and are admirably fitted for the improvement of readers of every age. The editors, the Rev. E. Churton and Rev. W. Gresley, have acquitted themselves faithfully of their meritorious and useful task, and deserve the thanks of the community for their labours of love.

*The New Eton Greek Grammar*, by Clement Moody. (London, Longmans and Co.)—Mr. Moody having been very fortunate in his edition of the "Eton Latin Grammar" in English, has been induced to prepare the Greek in the same manner: its success will be the best criterion of its execution.

## ARTS AND SCIENCES.

### ROYAL GEOGRAPHICAL SOCIETY.

JAN. 13th. Mr. Greenough, F.R.S. President, in the chair.—Read, a letter from James Brooke, Esq. on board the *Royalist* Yacht, communicated by J. C. Temple, Esq.

"Sarawak, in Borneo, 20th Aug. 1839.

"Touching at Rio de Janeiro and the Cape of Good Hope, we reached Singapore in June last. While there, we surveyed a part of the island hitherto not examined; and I went up the Peloi river, a noble stream, but unfortunately barred at its entrance. We traced the chief branch to its source, and another very nearly so. The country about Singapore is undulating; the highest eminence, Birket Timak, or Tin Hill, being 450 feet above the sea. From Singapore, which we left a month ago, we crossed over in two days to Tanjong Apé, discovering an island not laid down in our charts. We here formed a base line, and surveyed the bay between it and Tanjong Datú, finding it quite clear of danger. Tanjong Datú of the charts is, by our chronometers, from seventy to eighty miles too far to the east and north. From Datú we entered the next bay; and measuring a fresh base, surveyed with great care between this point and Sepang. The included bay is about 100 miles in extent, and of some depth. The two islands of Talong Talong are situated in the centre of the bight. The mountain of Poa rises on the mainland of Borneo, not less than 4000 feet, close to its edge. At one corner is the river Lundú; and near the extremity of Sepang the noble mountain of Santobong, close to which is the Sarawak river. The entrance of this river is somewhat difficult, but has sixteen feet depth of water at the first of the ebb. We anchored just inside, in seven and a half fathoms, and despatched a boat to the Rajah Múda Hassim; who, after many inquiries, sent a parqueran of rank to welcome and accompany us up. The scenery at the entrance of Sarawak is noble. The peak of Santobong, clothed in richest verdure, rises close to the right bank, straggling trees, mixed with cliffs, crown the summit;—a white beach, fringed with light and elegant casuarinas, finishes the whole. Wild hogs in abundance, but as shy as if they had been fired at all their lives, and some fine grey pigeons, but we got none. We dropped up the river, taking a hasty survey, to the town of Kuching, or Cat Town, the distance thirty-six miles. Water generally deep, but here and there with awkward rocks; on one of these, being ignorant of the river, the *Royalist* was swept by an eddy of the tide, but got off without harm, though, had the ebb been running, our position would have been critical. The following morning, we anchored off the town, and saluted the rajah with twenty-one guns; on visiting him we were received with marked distinction, he always addressing me as the 'Great Man.' Rajah Múda Hassim is a little man, middle aged, with a plain but intelligent face. He

is the uncle of the Sultan of Borneo, and virtually the governor of the vast country lying between Point Daltú and the north of Borneo. He is a man of great ability and very partial to the English. Seráwak, or Kuching, is a newly established place, and likely to prove important in a commercial point of view. Antimony ore is produced in any quantity; gold, tin, rattans, bees' wax, and birds' nests, are procured from the surrounding country; and at the place itself is a white clay, excellent for pipes, and which the Dutch would prize; in short, in the opinion of the Malays, it is richer than any other locality along the whole line of coast. Two days were wasted in ceremony. The rajah visited us; we visited the rajah's brother, Múda Mahommed, a sulky savage. In the morning of the same day, I intimated my wish to be allowed to visit various places in the rajah's territory, particularly some Dayak tribes. I received his permission, to my surprise, to go to Samarahn and Landú—the latter full of Dayaks—but he informed me that he could not answer for my safety going up the river, as he was at war with some rebellious subjects. I was too glad to get this permission, and to-morrow morning we start on the first of these excursions.

"August 27.—We have returned from our trip from Samarahn, a noble river navigable for fifty or sixty miles; inhabitants few, but most of the land cleared, producing quantities of rice of the finest quality. We have been one hundred miles up this stream, and turned back with regret, on our attendant parqueran insisting on it; but the abundant river had dwindled to a stream, not broader than just to allow us to pull clear of the trees in our *skim-along*. The geological features of the country are granite mountains filled in with a rich alluvial soil of great extent, which is, in every part, intersected by fine rivers. Close to this are the rivers Samarchon, Mortubas, Quosa, Riam, Saráwak; most of them equal to the Thames in width and depth, save at their entrance. I am writing this in haste at Sarawak, having an opportunity of sending it by a Malay prahu bound to Singapore. Múda Hassim and James Brooke are great friends. I think I shall get a passport either now, or at some other time, to visit the whole of his kingdom. The day after to-morrow we start for Landú, to visit three tribes of Dayaks—the tribes of Landú, Sibúyon, and Raich, the latter in the territory of Sambas under the Dutch. As a summary, say we have executed a survey of fifty or sixty miles of the coast, which may be called entirely new. We have been one hundred miles, or nearly, up the noble river Samarahn, never before mentioned, and through many parts of the country, and seen many new rivers; that we are on the full progress of research, and during the cruise I hope to finish this coast, and see a good deal of the country besides. My object is to get among the Dayaks of Rejong and Birtulu: the latter are tattooed, and use the *sampit*, or blow-pipe. I am forming vocabularies of their different languages, and lean strongly to the opinion that they are not of the same race,—habits, manners, &c. being different, as I am told. I soon hope to tell you something more from personal observation. Our next civilised place will be Manila, whence you shall hear again. Natural history does not flourish here; for there is no shooting or seeing any thing in these jungles. Birds and monkeys are abundant, and I am told, that when we get among the Dayaks we shall get plenty of all sorts. I doubt; but I hope. I must not omit to mention that the climate here is very healthy and

cool; the thermometer often at 78°, sometimes 76°, never more than 85°, and that very rarely. The nights are so chilly, that in the boat I was glad to have my boat-cloak wrapped around me."

### SOCIETY OF ARTS.

JAN. 14th. Mr. C. H. Smith, 'On Stone for Building.'—Mr. Smith was one of the gentlemen appointed by the Commissioners of Woods and Forests to inspect and report with reference to the selection of stone for building the new Houses of Parliament; his illustration, therefore, on the present occasion, necessarily embraced many of the details of the report made to Parliament last session. In all the ancient ecclesiastical edifices, baronial halls, and so forth, there is no stone to be found of larger dimensions than may be carried by two or three men; hence, those buildings are generally constructed of stone from neighbouring quarries; hence, too, the rapid decay of many of them. The greatest care is necessary in the selection of stone for building, as we have good and bad stone from the same quarry; a great quantity of the latter is brought to the London market: most of the public buildings being contracted for, the stone-merchant is fain to take that stone which is most easily quarried. Blackfriars' Bridge, for instance, in 1770, was constructed of this quality of stone, and presented sure signs of decomposition even before the bridge was finished! Mr. Smith exhibited many specimens of stone, some of which (that from Reigate) were so soft, that they crumbled into powder by the pressure of the thumb and fingers; yet houses were built of that material, and called good houses too by their proprietors. We purposely abstain from going into the scientific details of Mr. Smith's very able lecture: to treat it in such a manner would far outstep our limits, nor are we sure that it would be generally interesting. Suffice it to say that all stone is composed of the same elements, and may be divided into two classes or sorts,—sandstone and limestone: the former is easily recognised; passing it over glass it cuts like a diamond; while the latter, though never so much crystallised, leaves not a trace on the surface. Eight or ten specimens of stone were placed in water, where they remained; at the close of the lecture the glasses which contained the specimens were shaken, and it was curious to observe the extreme action of the water upon the inferior sorts,—melting them away, and leaving a sediment more or less thick and muddy, according to the quality of the stone. It was gratifying, however, to observe the glass in which a specimen of the stone for the new Houses of Parliament was submerged; here there was no sediment, the action of the water left the stone untouched. The stone so recommended is the magnesian limestone, or dolomite, of Bolsover Moor and its neighbourhood.—Mr. W. A. Graham has been elected Secretary in the room of Mr. Aikin, who has retired, carrying with him the respect of every member of the Society.

### PARIS LETTER.\*

Académie des Sciences, Jan. 6.

An interesting paper was read by M. Robiquet, upon a new substance discovered in mustard, readily crystallisable, and resembling starch,

\* We have great pleasure in endeavouring to renew a portion of our continental information, from a correspondent acquainted with the value of novelties, and thus able to give their substance at what they are worth, without loading our columns (which have enough to do with interesting native matters) with long and extraneous trifling, or, what is worse, tinged with politics.—Ed. L. G.

produced by the action of ammoniac on the essence of mustard.—M. Arago read a letter from M. Blanqui, of Toulouse, communicating a plate, with a photographic impression, obtained by a modification of M. Daguerre's apparatus, in which the red brick of a house is represented in their natural colour by the action of the light; but the green shutters of the same house were also represented in red.—A communication was read from M. Dabadie, the Abyssinian traveller, giving the barometrical elevation of the following places in that part of Africa:—Lori, in the province of Samen, 3503 metres; Amodjadj, near Gondar, 3091 m.; Halay, near the coast of the Red Sea, 2700 m.; Gondar, the capital, 2294 m.: Adwa, capital of province of Togray, 2029 m.—The Academy resolved to petition the minister of war for leave of absence to be granted to Professor Aimé from Algiers, in order that he might come to Paris to examine the instruments for the magnetic observations which he is to make in that part of Northern Africa. These instruments are the identical ones used in Captain Ross's northern expedition, which have been judged better for use, in order that the observations may be more easily compared with those of British savans.—It was hinted, in a letter from M. Hermann, that the meteoric bodies, called shooting stars, being supposed to be bodies revolving round the sun, made their revolutions in six months; and when not perceived as luminous bodies on the earth, passed between it and the sun, and caused partial obscurations of that luminary, together with corresponding diminutions of heat. Curious variations of the curves obtained by thermometrical observations were stated to correspond with this hypothesis.—M. Duhamel communicated an elaborate memoir on the exact determination of the vibrations of strings, and musical sounds thereby produced. The result of his method, which was the carrying out of the principle of D. Bernouilli, may be stated thus:—When a body causes at the same time several sounds, each of which it can produce separately, they are not all the elements of the surface which produce each of these sounds, but its surface may be considered to be divided into a finite number of parts, in each of which a single sound reigns exclusively. These different sounds are no other than what are heard all together, and present the same case as if they were produced respectively by distinct sonorous bodies.—A memoir from M. Bellenger combated the idea of hydrophobia being caused by any thing else than a moral affection—fright; and proposed that a premium of 1000 francs should be offered for the producing of a well-authenticated case of hydrophobia being communicated to the human subject by inoculation,—all circumstances of moral affection being supposed totally removed.

The Academy of Moral and Political Sciences has been much occupied of late with a discussion on M. Blanqui's elaborate report upon Algeria. Some of the members have contested the accuracy of his ciphers; others have controverted his authority in various points: and all have delivered their opinions *in extenso* as to the best means of making the most of a bad bargain,—the French possessions in the north of Africa.

M. Didron, the secretary of the Comité Historique des Arts et Monuments, is shortly expected back from his Eastern tour: he is now at Malta. He has discovered a valuable MS. at Mount Athos, containing a complete code of Byzantine-Christian decoration and ornamentation for sacred edifices, &c. He is on the

trace of another MS. on architecture at Adrianople.

M. Loireleur de Longchamps, a young and promising Orientalist, died the other day.

The Minister of Public Instruction has just founded a chair of vulgar Chinese; and M. Bazin, a pupil of the learned Orientalist, Julien, has been named to it.

#### LITERARY AND LEARNED. SOCIETY OF ANTIQUARIES.

MR. HAMILTON in the chair.—Sir Hilgrove Turner presented two drawings of Druidical remains in Jersey. The conclusion was read of a paper commenced at the last meeting, from Mr. Archibald, 'On some Ancient Guns and Ammunition found buried in the Sand and Clay on the Western Shore of the Island of Walney, Lancashire.' About twenty guns were discovered, formed of wrought-iron bars, hooped together, a great number of stone balls, an eighteen-pound shot of hammered iron, and some small ones cast, and covered with lead. Mr. Archibald traced the history of the use of ordnance from the earliest known period, and the various forms and means used in its progress from the rude beginning to its present complete state, and considered that the specimens described were of the time of Edward IV. In which opinion he is supported by the circumstance that the spot where these remains were found is in the immediate neighbourhood of Peel Castle, where Lambert Simnel landed from Ireland, in 1467, with his forces, commanded by Martin Swartz and Geraldine, and where they were joined by Sir Thomas Broughton; and it is supposed that a vessel of Simnel's fleet, containing these pieces of ordnance, was wrecked on the spot where they were discovered.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

Monday.—Statistical, 8 P.M.; British Architects, 8 P.M.; Medical, 8 P.M.  
Tuesday.—Horticultural, 8 P.M.; Civil Engineers' (Anniversary), 7 P.M.; Electrical, 8 P.M.  
Wednesday.—Society of Arts, 7 P.M.; Geological, 8 P.M.; Medico-Botanical, 8 P.M.  
Thursday.—Royal, 8 P.M.; Antiquaries, 8 P.M.; Royal Society of Literature, 4 P.M.  
Friday.—Royal Institution, 8 P.M.  
Saturday.—Westminster Medical, 8 P.M.; Mathematical, 8 P.M.; Physical, 8 P.M.

#### FINE ARTS.

##### HER MAJESTY AND PRINCE ALBERT.

DURING the whole of the present week, miniature portraits of Her Majesty and Prince Albert of Saxe-Cobourg-Gotha, painted by W. C. Ross, A.R.A., have been on private view at Messrs. Colnaghi and Puckle's, in Cockspur Street. They are beautiful and highly finished works. That of the Queen is a half-length. Her Majesty is seated on the throne. She wears the blue riband of the Order of the Garter, but no crown, or any other insignia of royalty. The resemblance is very striking, the features are full of vivacity, and the flesh is charmingly coloured. The portrait of Prince Albert is a small oval, containing merely the head and shoulders. Never having been so fortunate as to see the Prince, we are of course not competent judges of the likeness; but the expression is intelligent and pleasing.

#### THE DRAMA.

Covent Garden.—On Monday, Mr. Moore, a gentleman of provincial reputation, made his first essay before a London audience here in the arduous character of *Hamlet*. Making allowances for the anxiety and trepidation of a

début in the highest walk of the art, we should say that he neither failed nor succeeded; meaning that he did not succeed in *Hamlet*, but evinced very respectable talents for the stage. The performance was throughout very measured and level. There were no extravagances,—nothing to provoke disapprobation; but, on the other hand, there wanted fire and passion, and there was little to excite applause. The cause of "this effect defective" was literally deficiencies. A sameness pervaded the whole, so that the play-scene, the closet-scene, the *Ophelia*-scene, and the grave-scene, were too little removed from the soliloquies; and in the soliloquies the most stirring passages were hardly distinguishable from the rest,—the bursts of natural feeling from the calm of philosophical reasoning. The play occupied three hours and a half in acting: and there was no masterly expression of eye, or countenance, or gesture, to make the pauses, or rather the monotony, attractive. From beginning to end, with a brief start in "Go to a nunnery," &c., Mr. Moore enounced every word and every syllable most distinctly, almost as if he were reading the part; and the result was that all the tenderness of the gentle-spirited *Hamlet* was lost, and there remained only a rigid sternness quite inconsistent with his mental attributes and peculiar circumstances. The most wavering and irresolute of tragic heroes had a misplaced and mistaken fixedness that left his eye tearless, his voice without pathos, and his demeanour without variety. Now these are faults fatal to the adequate personation of the Prince of Denmark, and consequently the play was tame and tedious. In characters of another kind, we have no doubt Mr. Moore will take a superior stand. His line seems to lie neither in the mournful heart-touching, nor the wild outbreaks of the deeper passions (for the glorious opportunities of exhibiting these in *Hamlet* came tamely off); but wherever a good person, sententious utterance, appropriate action, and evident sound sense, are required, there he will be at home. The *Queen*, being the first appearance of Miss C. Poole, we must pass over; and for the remainder, content ourselves with noticing that Mrs. Walter Lacy's *Ophelia* was very praiseworthy; Mr. Farren's *Polonius*, excellent where humour prevailed; Bartley's *Premier Gravedigger*, racy; and Granby's *Second*, in fair keeping; T. Green's *Oscio*, the perfection of ancient dandyism; and Mr. Cooper's *Ghost* benefited by a fine moonlight walk (new scene) on the sea-shore at Elsinore.

*Après* of Shakspeare: it never struck us before, and might have been impressed by Mr. Moore's mode of delivery, that there is a curious contradiction in *Hamlet*'s exquisite soliloquy, "To die or not to die," wherein he speaks of that *bourn* from which no traveller returns; whereas, on the contrary, he is the last person on earth to say so, seeing that his own father has returned, and given him, though vaguely, rather important intelligence from the other world.

*Haymarket*.—On Thursday, the *Love Chase* was played to a full house, for the benefit of Mrs. Glover, and to introduce to the public a new claimant upon their favour, in the person of Miss Howard; a pupil, we understand, of that excellent actress, and to whom was assigned the arduous but good-acting part of *Cousin Constance*. Miss H. is rather tall, of fair personal attractions, and a fresh and pleasing, if not very expressive cast of countenance. After her first alarm, which was overpowering, subsided, she entered into the spirit of the

character with animation, and delivered its sentiments of ridicule, alarm, disappointment, and regard, or rather love, in a manner to shew that she possessed very considerable capacity for the stage. She was most warmly received, and indeed deserved it, not only for the promise she displayed as a *débutante*, but for the talent she exhibited. Miss Cooper looked and performed charmingly in *Lydia*; and Mrs. Glover was the *Widow Green* all over. Several of her better scenes smacked richly of that old school of which, we grieve to say, so little remains. Mr. Strickland also, and Mr. Walter Lacy, not forgetting Mr. Hemmings, did full justice to their characters of *Sir W. Fondlove*, *Master Waller*, and *Truworth*. At the end, Miss Howard was called for, and a couple of bouquets thrown to her from one of the stage-boxes, amid immense applause.

This theatre concluded its very prosperous season on Wednesday, with a bumper benefit for its enterprising and liberal lessee, Mr. Webster.

#### VARIETIES.

**African Expedition.**—Lord John Russell, in the House on Thursday, alluded to the African expedition to sail in autumn under Captains Trotter, Allen, &c., in order to follow up the African discoveries of our various enterprising countrymen, and particularly to explore the Niger and its tributaries after the footsteps of the Brothers Lander. His lordship expressed a hope that this might lead to African civilisation, and with it, to the extinction of the slave-trade; a hope in which the whole Christian world must sympathise. *The Times*, observing on the subject, intimates that the plan will probably follow out Mr. Buxton's suggestions in his recent interesting publication; but we believe it will be more completely developed in his forthcoming volumes, which will complete these painful revelations.

**Anti-Slavery.**—In connexion with the foregoing we may notice, and we do so with great approbation, and an earnest wish for its success, No. 1. of a new periodical, entitled *The British and Foreign Anti-Slavery Reporter*, addressed not only to the abolition of the slave-trade, but of slavery wherever it exists. The number is full of most valuable matter, and declares that moral and pacific influences alone are to be employed in this good and gracious work. We trust the British public will unanimously assist in promoting objects of such vital importance.

**Guiana Exhibition** (209 Regent Street).—Under this title, Mr. Schomburgk has opened a most interesting exhibition of the objects of natural history collected in his three expeditions into the interior of British Guiana (Sir Walter Raleigh's "El Dorado"), besides native productions of every kind, utensils, instruments of war and chase, dresses, ornaments, &c. &c., not to mention three natives themselves, alive and lively. These individuals, though from places only a few miles apart, speak different dialects, and practise different customs; and are well worthy of attention. But the whole collection, of nearly five hundred articles, birds, animals, poisons, blow-pipes for shooting game, spears, clubs, sceptres, feather ornaments, beads, &c. &c., is really as instructive as it is in many respects novel and exceedingly curious. Both youth and age will be delighted with a visit; but we advise no moustachioed and bearded dandy to go, for there is a monkey, the *Pithecia sagulata*, *Cushibu* or *Pisha*, which beats them for hair on face and chin, curling, dressing, &c. out of all comparison.

**Penny Postage.**—The newspapers recommend the universal prepayment of letters, as, indeed, it does seem selfish to subject a correspondent to double the amount which a letter would cost yourself; and if it could be generally adopted, the practice would be a good one. But there are parties who can hardly be expected to prepay their letters; for example, duns and lawyers, whose applications will now have an additional disagreeableness attached to them. Again, even with the wish to prepay, what can be done with all our letters from five o'clock on Saturday afternoon to past eight on Monday morning, which we may wish to post so that they may reach their destination as early as possible? These cannot be prepaid, and must be excused as exceptions to the rule. On the whole, without inquiring into the policy or impolicy of the measure, it is pleasant enough to receive one's letters at so little cost, and we agree with the epigram:—  
"Tis a good scheme that tends in our purses to foster us,  
And to say it is bad, like itself, is pre-post-erous."

**Oster's Mercurial Letter Gage: a Letter Weighing Machine.**—Of the various inventions to meet the new post-office regulations, and ascertain, in the readiest manner, the weight of letters, we have seen nothing to compare with the above for elegance, simplicity, and precision. It is quite worthy of the ingenious constructor of the Anemometer. In a small upright glass tube, on a stand, and about the size of a bedroom candlestick, is a quantity of mercury, into which is plunged a graduated ivory column, marked half ounce, one ounce, one ounce and a half, two ounces, &c., with a convenient table on the top to receive the letter to be weighed. According to its weight, the column descends and the mercury rises, indicating in a moment the exact weight of the letter. It is, in short, equally ornamental and useful, and an instrument to accompany every inkstand in the United Kingdom.

point his slow, unmoving finger at."—*Othello.*

"Digitis monstrari et dicere hic est."—*Persius.*

E. W.

**Vienna.**—A clockmaker of this city, whose

name is Mathias Ratzenhofer, has solved the problem proposed by Professor Gruithausen at Munich, "To construct a clock which shall shew at once the time in several cities, the works of which shall not be in any wise hindered in their movement, whether they put in motion more or fewer clocks for different places, whether they are in Europe or in the other quarters of the globe, and the hands of which may be changed at pleasure, and directed to other places." This clock goes right, and its dial-plate, which is fourteen inches in diameter, has in the centre the dial for Vienna, and around and radiating from it seventy-two cities of different parts of the world, each with its own dial and the name of the place. It shews the difference of mean time between Vienna and the seventy-two other towns, and is set in motion by a four-pound weight only: all the other clocks, however, are put in motion from the centre of the Vienna clock; so that if the works stand still, nothing more is necessary than to set the Vienna clock to make all the other clocks indicate the true time. Professor Gruithausen, in a letter to the "Universal Gazette" of Augsburg, endeavours to shew that this clock is not what he intended.

#### LITERARY NOVELTIES.

*In the Press.*

Solitary Moments: a Collection of Poems on Various Subjects and Occasions, by Edward Hoare, late of Farnley Hill, county Cork, Esq.

"An Abstract of the Unparalleled Vicissitudes, &c. of Mr. Henry Bushell, son of the late T. Bushell, Esq." (pp. 36), is a narrative, we fear, not so fit for the critic as for a court of *limatico inquirendo*.

#### LIST OF NEW BOOKS.

Green, fcap. 4s. 6d.—Nuston's Recognition in the World to Come, fourth edition, 12mo. 7s.

#### TO CORRESPONDENTS.

Many communications have reached us this week too late for notice. May we again impress upon our friends and correspondents the convenience, and indeed the necessity, of being as early as convenient in the season of very various and pressing concerns? It is impossible to do justice, and be accurate, when we are driven to the last few hours.

## ADVERTISEMENT,

Connected with Literature and the Arts.

**TO BOOKSELLERS.**—A Gentleman conversant with Portuguese, Spanish, French, and Italian, offers to undertake the Translation into English of any prose work in the above languages.—Address (post paid) to F. A. K. Norfolk Coffee House, Strand.

3 vols. 8vo. Next week.  
John Murray, Albemarle Street.

**HAMILTONIAN SYSTEM.**  
"We recommend those who wish to acquire a knowledge of languages in the least time possible, to use the books arranged with interlinear translation, by J. Hamilton." The "Edinburgh Review" ascribes to the author of this system "the great merit of introducing translations made in invariable accordance with a strict verbal analysis;" and it remarks, that "it is this peculiarity which renders them such invaluable instruments to the learner."

The following Books, on the Hamiltonian System, are published at Sonnet's School Library, 131 Fleet Street.

## COLONIAL MAGAZINE (No. I.)

Edited by ROBERT MONTGOMERY MARTIN, Esq.  
"This is a solid and able publication, which will be of infinite value both to the mother-country, and to those wonderfully extensive colonies which are carrying the English language and civilization from pole to pole."—*Literary Gazette*.

"We commend the 'Colonial Magazine' to the intelligent and patriotic, as likely to guide them in the pursuit of that knowledge so essential to the full development of the vast resources of our numerous colonies."—*The Persuasion*.

"This magazine will suit every one who has really at heart the welfare and happiness of his country."—*Sheffield Patriot*.

Advertisements for No. II. of the "Colonial Magazine," must be forwarded to the Publishers by the 20th inst.—Bills (2000) by the 25th. To all persons desirous of bringing their productions under the notice of the wealthy and intelligent at home and abroad—but particularly to Merchants and Manufacturers, not usually in the habit of advertising, anxious to form new connections, agencies, &c. &c., this Magazine especially recommends itself. Advertisers are requested to send by post direct to Fisher, Son, and Co. Newgate Street, London.

London: Printed for Thomas Tegg, 73 Cheapside.

NEW EDITION OF THE WORKS OF

**SIR E. L. BULWER, BART. M.P. M.A.**

IN MONTHLY VOLUMES, PRICE SIX SHILLINGS.

BEAUTIFULLY ILLUSTRATED, FROM ORIGINAL DRAWINGS MADE EXPRESSLY FOR THIS WORK.

Various attempts at Collected Editions of the Works of SIR EDWARD LYTTON BULWER have been made, year after year, in different parts of the Continent, and, in spite of all the imperfections incident on foreign presses, a very extensive demand has rewarded the Publishers of such Editions, in France and Germany, as well as in the United States. Messrs. SAUNDERS and OTLEY beg now to announce the first Uniform Edition of the Works of this Author, printed in his own Country, and addressed to that Public in the hope of whose approval they were originally composed.

The Series will be published Monthly, and include not only all the acknowledged Works of SIR EDWARD LYTTON BULWER that have yet appeared (excepting only those already printed by Mr. COLBURN and Mr. BENTLEY, in their several Libraries of Fiction, and therefore already before the Public in the same popular size and form of Six-Shilling Volumes), but some not hitherto published. The whole will be carefully revised by the Author, and no pains spared to give to this Edition a new and distinctive value.

The Illustrations will be entirely original, from Designs by the first Artists, and engraved in the most finished style.

The First Volume, containing "RIENZI, OR THE LAST OF THE ROMAN TRIBUNES," beautifully illustrated from Drawings by McCLEISE and CRESWICK, will appear on the 1st of February, 1840. The succeeding Volumes will be published regularly on the First of every Month.

\* \* Orders are requested to be addressed to the Publishers, Messrs. SAUNDERS and OTLEY, Conduit Street, Hanover Square, London; to their Agents, Mr. J. CUMMING, Dublin, and Messrs. BELL and BRADFUTE, Edinburgh; or to the Booksellers in Town and Country.

Will be ready on the 1st of February, Vol. I. of

**MILLS' HISTORY OF BRITISH INDIA.**

WITH NOTES AND ILLUSTRATIONS, AND CONTINUATION OF THE HISTORY

By HORACE HAYMAN WILSON, M.A. F.R.S.

Boden Professor of Sanscrit, University of Oxford, &amp;c. &amp;c.

The Work will consist of 8 vols. 8vo. to be published in Succession.

LONDON: MADDEN AND CO. 8 LEADENHALL STREET (late Parbury and Co.);  
L. A. LEWIS, 125 FLEET STREET.

Will be ready the 1st of February,

### REVIEW OF NEW BOOKS.

*Observations on the Financial Position and Credit of such of the States of the North American Union as have Contracted Public Debts, &c.* By Alexander Trotter, Esq. 8vo. pp. 456. London, 1839. Longman and Co.

A PUBLICATION of greater national interest than this volume, or one of more importance to thousands of individuals who have property invested in American funds, could not be offered to the consideration of the English people. Considering the vast amount of British capital at stake, it is quite astonishing how little the affairs, on the management and issue of which such vital consequences depend, are known and understood in this country. In a pamphlet lately published by Mr. Duer, an intelligent American, this is much and justly deplored; and he complains that no rational confidence, founded on a true knowledge and candid estimate of the condition, resources, and character of his country, has been reposed in the government or people of the United States. A blind and unreflecting confidence, he adds, is not required; but one which shall be the result of inquiry, and be at the same time prudent and discriminating. To enable us to arrive at these desirable results, the facts collected and clearly enounced by Mr. Trotter are most worthy of serious attention; and we are certain that no one can rise from the perusal of his work without having much of, if not all, the ignorance and prejudice which prevails on the subject dispelled.

The main points elucidated may be instanced from the title-page, viz. as "comprising an account of the manner in which the sums raised by each state have been applied, and a consideration of the probable effects of such application upon the general wealth and prosperity of the country." A map, shewing the railroads and canals which have been constructed, wholly or in part, out of state loans, together with the private railroads in connexion with them, further illustrates the subject, and helps much to its proper understanding.

Mr. Trotter's view of the credit of the federal government is highly favourable, but so far from considering the credits of the separate states as identical with this, or of equal value as compared one with another, he proceeds to demonstrate that they are very unequal and widely different in worth as public securities. The national banks of the United States (1st, from 1791 to 1811, and 2d from 1816 to 1836), it is contended, were of prodigious benefit to the country, and fully deserving of the trusts reposed in them. But when the charter of the last expired in 1836, and the corporation only received a charter from the State of Pennsylvania, thus ceasing to be a national establishment though it retained the name, the determined opposition of the President, carrying with it the sanction of the legislature, led to the disastrous consequences which are now seen and felt on every hand.

In a periodical like ours it would be impossible to enter upon the figures and details with which the author supports his arguments, or

go into the collateral questions involved in these of finance; such as the geographical features of the country, the tariff, the wars with the Indian tribes, the speculations in lands and territorial grants, the interference with deposits and the monetary system, overtrading, and other matters of like general and direct influence. We must be satisfied with putting together some of the leading information with which the book abounds, and leaving its more minute intelligence to be ascertained from its own pages. To begin:—

"The soil constitutes the chief source of the wealth of the United States. Nearly nine-tenths of the whole domestic exports are derived from its produce; and it is estimated that seven-tenths of the population are employed in agricultural pursuits. Cotton, tobacco, flour, rice, and sugar, form the most important items in these exports; for which the United States receive in exchange either the manufactures of the country they are sent to, or such few products of the soil as their own climate will not allow them to raise. The cultivation of these staple commodities is confined chiefly, as we have seen, to the southern States; and the growth of cotton is most extensive in those which border on the Mississippi and on the Gulf of Mexico. In these States, the growers of these different descriptions of produce, having little realised capital, are obliged to have recourse to the capital or credit of their wealthier neighbours for the means of raising their valuable crops. The growers of rice and tobacco depend chiefly on the southern Atlantic cities, while the cotton planters usually obtain advances for the purchase of their slaves and the improvement of their plantations from the merchants or factors of New Orleans, or other ports on the Gulf of Mexico. They are supplied with clothing for their slaves, and other necessary articles of consumption, on credit, by the smaller country traders, who procure them on a still longer credit from the merchants of the Atlantic cities."

The United States Bank, Mr. T. contends, was absolutely necessary for these operations, and when the deposits were withdrawn from it, all fell into confusion. It could aid industry no longer, and immense failures were the inevitable result. These in turn led to the suspension of specie payments by the banks, and to the present condition of American trade and credit in every separate state, the combined government having refused to make itself and the nation responsible to the creditors. We have, therefore, to look to the returns from public works, &c. on which the loans have been expended; to the banks, with their various proprietaries; and to certain auxiliary funds in the treasuries of these States, for the payment of interest on the sums which have been borrowed. The nature of the securities is widely different, as the States are connected in different degrees with their banks, and the public works are more or less productive. The revenues and expenditure of the States also form a very essential item in these calculations. Thus, for example, we are told:—

"There appears to be more realised wealth

in Massachusetts, compared with the population, than in any other state of the Union,\* while the inhabitants are in possession of a most thriving trade. The shipping belonging to this State amounts to 470,388 tons, exceeding that of any other state, and constituting about one-fourth of the whole shipping of the United States."

Having shewn the relative situation of all the States, Mr. Trotter proceeds to say:—

"The statements in the last chapter exhibit in a strong light the impulse which the policy of the several States of the Union has given to the industry of the citizens, by raising funds, on the credit of the state, to be applied to works of public utility. At the end of the year 1835, the debts of the separate States already amounted in the aggregate to more than sixty millions of dollars, the greater part of which sum had been expended in a productive manner; between that time and the middle of 1838, an addition of no less than \$108,423,808 00 was either made to this amount, or authorised to be raised, and the sum since added is considerable, the aggregate amount of state debt now exceeding \$183,000,000 00. Of the amount raised or authorised from 1835 to 1838, about forty millions were appropriated to the establishment of banks, and about sixty-eight millions to works of internal improvement. As the average profits of banking in the United States considerably exceed the interest paid by the States on the bonds which they have issued in payment of their shares, or for the establishment of the banks in which they are interested, there will usually be found, in this source, a sufficient fund for the payment of the interest and final liquidation of the bonds raised for this purpose, if the banks are managed with common prudence; but an attentive consideration of the facts adduced can scarcely fail to shew the probability that many of the works undertaken by the States, to facilitate internal communication by means of canals and railroads, will fail to yield a revenue sufficient to keep the works in repair, and to pay the interest on the loans raised for their construction. In all these cases, as well as where the finances of the State, from being too much mixed up with banking institutions, and dependent upon them, may be deranged by injudicious management of the banks, auxiliary funds will be required to sustain the credit of the State; or, if these do not exist, recourse must be had to taxation. In the case even when auxiliary funds have been set apart, they are not, as we have seen, in all cases adequate to the required purpose; or, if ample at present, they are, in many instances, derived from sources which are in themselves uncertain. The time, therefore, will probably

\* "The population of Massachusetts, according to the census of 1830, was 610,014, and the property of the state in that year was assessed at \$284,361,407 34. The population of the state of New York, according to the same census, was 1,911,602, and the real and personal property was assessed at \$319,118,996 00, being scarcely one half of its relative proportion. The State of New York has increased more rapidly since in population than Massachusetts, and the rate of increase in property may also have been greater; but this difference is not nearly made up."

come, and seems now to be approaching, which is to determine whether, in case of a partial or total failure of the expectations of the projectors of the various schemes on which the States have entered, those states so circumstanced will be willing to uphold their credit by submitting to taxes levied for the express purpose of providing for engagements entered into by their legislatures, and whether they will be willing to go to the extent that may be necessary for this purpose."

Though on the whole favourable to the promise that the States will submit to taxation, to pay the interest of their loans, and fulfil their just engagements, Mr. Trotter expresses some apprehension from the effect of the continued and rapid strides of democratic principles all over the Union, and confesses that these may overthrow the wiser and better order of things which would sanctify every public contract. And he adds:—

"Should the States be obliged hereafter to have recourse to taxation to defray the interest on their loans, it will not, probably, be till the different undertakings for which the loans were raised will have been rendered unpopular by want of success; and, although it does not follow that the people, under these circumstances, will refuse to submit to the necessary sacrifice, their adhering to their engagements cannot be so confidently depended upon, as it might be if the legislative bodies were returned by classes more directly interested in the maintenance of the financial integrity of the States."

He concludes:—

"On a review of the whole subject, we have seen the conduct of the States collectively in respect of former loans, and their punctuality in discharging them: we have seen the physical condition of the country, and the well-founded prospects of still greater resources being derived hereafter from the improvement of the vast territory yet to be cultivated: we have seen their prudent manner of managing their affairs, both in the frugal expenditure in the civil government generally, and in the application of their loans; and in a country in which the population so rapidly increases, it must be borne in mind, that if recourse must be had to taxation to defray the interest on their debts, the greater the number to assist in paying it, the lighter will be the burden upon each: we have seen, lastly, the general enterprising and industrious character of the people. Such are good ingredients towards the establishment of national credit; and a considerable degree of confidence is due on these grounds to the engagements of the States generally. In the case of the northern Atlantic States, Massachusetts and New York may be looked upon as entitled to the highest place in the scale. We have here realised wealth, an extensive trade, old-established institutions, and a people to whom the general good character given to the citizens of the States more particularly applies. In instituting a comparison between the newer northern and the southern States, it may, perhaps, be affirmed that, although the latter are richer, and possess more present means of meeting their engagements, the northern States contain the elements of a more enduring prosperity."

Before we lay down our pen we may mention, which we do with some degree of self-gratulation, that one of the safest banks in America is the Planters' Bank of Louisiana, established on principles strenuously upheld in a series of papers in the *Literary Gazette* for 1826-7, as a scheme for remodelling the cur-

rency of Great Britain, on issues controlled by government, and trebly secured on real property. In New York, also, the same system has been adopted; and when we look back to our efforts in this cause, every new crisis in our finances, and every increase of distress in the country, fills us with more and more regret that, enamoured with their own favourite theories, those in power and authority utterly disregarded our humble representations. It is not a little remarkable that "The Times" newspaper (so conversant with business of the kind), which at that period opposed our views, has since seen reason to modify its opinions, and, in a recent article, absolutely to recommend the spirit of our plan as a remedy for the manufacturing, agricultural, and commercial evils which press upon the industry and resources of the country. Sure we are that a circulating medium such as we have advocated would remove every misery that weighs upon the kingdom, and spread comfort and contentment where there is now nothing but wretchedness and Chartism.

*The Letters of Horace Walpole, Earl of Orford, including numerous Letters now First Published from the Original Manuscripts.* In 6 vols. Vol. I. (1735-1745.) 8vo. pp. 498. London, 1840. Bentley.

A MORE complete edition of the correspondence of this "prince of epistolary writers" cannot but be welcome to the public. There is nothing quite like these letters in our language, and, with only the due allowance for position and prejudices, they may well be received as the best brief chronicles of the stirring period to which they relate, from 1735 to 1797! So much has been remarked upon them, as various portions have appeared at various times, that it would be an impertinent waste of words to repeat the criticisms with which the press has teemed; and, indeed, till the future volumes produce any thing of interesting novelty, we should be content to let the others speak for themselves.

The first of the series has only a preface, and reminiscences of the courts of George I. and II., which are new. The latter were written when Walpole was an old man, in 1788, for the amusement of his young friends, Miss Mary and Miss Agnes Berry; and though they smack of the garrulity of age, and are partially but the recollections of hearsay, yet they are very characteristic of the writer, and consequently very amusing. Of this, and of the general order of the publication, we shall enable our readers to judge, though it will not be needed to do so by copying more than a few brief extracts. The preface states:—

"The letters of Horace Walpole, earl of Orford, as hitherto published, have consisted of,—1. The letters contained in the quarto edition of his works, published in the year 1798; 2. His letters to George Montagu, Esq., from 1736 to 1770, which formed one quarto volume, published in 1818; 3. His letters to the Rev. William Cole and others, from 1745 to 1782, published in the same form and year; 4. His letters to the Earl of Hertford, during his lordship's embassy to Paris, and also to the Rev. Henry Zouch, which appeared in quarto, in 1825; and, 5. His letters to Sir Horace Mann, British envoy at the court of Tuscany, from 1741 to 1760, first published in 1833, in three volumes octavo, from the originals in the possession of the Earl of Waldegrave, edited by Lord Dover, with an original memoir of the author. To the above are now added several hundred letters, which have

hitherto existed only in manuscript, or made their appearance singly and incidentally in other works. In this new collection, besides the letters to Miss Berry, are some to the Hon. H. S. Conway, and John Chute, Esq., omitted in former editions; and many to Lady Suffolk, his brother-in-law, Charles Churchill, Esq., Captain Jephson, Sir David Dalrymple, Lord Hailes, the Earl of Buchan, the Earl of Charlemont, Mr. Gibbon, Mr. Pitt, afterwards Earl of Chatham, George Hardinge, Esq., Mr. Pinkerton, and other distinguished characters. The letters to the Rev. William Cole have been carefully examined with the originals, and many explanatory notes added, from the manuscript collections of that indefatigable antiquary, deposited in the British Museum."

The "Reminiscences" which follow a transcript of the late amiable Lord Dover's excellent memoir of Walpole, fill about seventy pages, and we copy from their court scandals and piquant anecdotes the following examples:—

"Observe," the writer tells his fair friends, "observe, I promise no more than to begin; for I not only cannot answer that I shall have patience to continue, but my memory is still so fresh, or rather so retentive of trifles which first made impression on it, that it is very possible my life (turned of seventy-one) may be exhausted before my stock of remembrances; especially as I am sensible of the garrulity of old age, and of its eagerness of relating whatever it recollects, whether of moment or not. Thus, while I fancy I am complying with you, I may only be indulging myself, and consequently may wander into many digressions for which you will not care a straw, and which may intercept the completion of my design. Patience, therefore, young ladies; and if you coin an old gentleman into narratives, you must expect a good deal of alloy. I engage for no method, no regularity, no polish. My narrative will probably resemble siege-pieces, which are struck of any promiscuous metals; and, though they bear the impress of some sovereign's name, only serve to quiet the garrison for the moment, and afterwards are merely hoarded by collectors and virtuosos, who think their series not complete, unless they have even the coins of base metal of every reign."

"As I was (he continues) the youngest by eleven years of Sir Robert Walpole's children by his first wife, and was extremely weak and delicate, as you see me still, though with no constitutional complaint till I had the gout after forty, and as my two sisters were consumptive, and died of consumptions, the supposed necessary care of me (and I have overheard persons saying, 'That child cannot possibly live') so engrossed the attention of my mother, that compassion and tenderness soon became extreme fondness; and as the infinite good nature of my father never thwarted any of his children, he suffered me to be too much indulged, and permitted her to gratify the first vehement inclination that ever I expressed, and which, as I have never since felt any enthusiasm for royal persons, I must suppose that the female attendants in the family must have put into my head—to long to see the king. This childish caprice was so strong, that my mother solicited the Duchess of Kendal to obtain for me the honour of kissing his majesty's hand before he set out for Hanover. A favour so unusual to be asked for a boy of ten years old was still too slight to be refused to the wife of the first minister for her darling child; yet not being proper to be made a pre-

cedent, it was settled to be in private, and at night. Accordingly, the night but one before the king began his last journey, my mother carried me at ten at night to the apartment of the Countess of Walsingham, on the ground-floor, towards the garden at St. James's, which opened into that of her aunt the Duchess of Kendal's apartments occupied by George II. after his queen's death, and by his successive mistresses, the Countesses of Suffolk and Yorkmouth. Notice being given that the king was come down to supper, Lady Walsingham took me alone into the duchess's ante-room, where we found alone the king and her. I knelt down and kissed his hand. He said a few words to me, and my conductress led me back to my mother. The person of the king is as perfect in my memory as if I saw him but yesterday. It was that of an elderly man, rather pale, and exactly like his pictures and coins; not tall; of an aspect rather good than augast; with a dark tie-wig, a plain coat, waistcoat, and breeches of snuff-coloured cloth, with stockings of the same colour, and a blue riband over all. So entirely was he my object, that I do not believe I once looked at the duchess; but as I could not avoid seeing her on entering the room, I remember that just beyond his majesty stood a very tall, lean, ill-favoured, old lady; but I did not retain the least idea of her features, nor know what the colour of her dress was."

The death of the first George immediately after this introduces us to the second, and with him to the annexed entertaining traits:—

"It was an instance of Sir Robert's singular fortune, or evidence of his talents, that he not only preserved his power under two successive monarchs, but in spite of the efforts of both their mistresses to remove him. It was perhaps still more remarkable, and an instance unparalleled, that Sir Robert governed George the First in Latin, the king not speaking English, and his minister no German, nor even French. It was much talked of, that Sir Robert, detecting one of the Hanoverian ministers in some trick or falsehood before the king's face, had the firmness to say to the German, '*Mentiris, impudentissime!*' The good-natured monarch only laughed, as he often did when Sir Robert complained to him of his Hanoverians selling places, nor would be persuaded that it was not the practice of the English court; and which an incident must have planted in his mind with no favourable impression of English disinterestedness. 'This is a strange country!' said his majesty; 'the first morning after my arrival at St. James's, I looked out of the window, and saw a park with walks, a canal, &c. which they told me were mine. The next day, Lord Chetwynd, the ranger of my park, sent me a fine brace of carp out of my canal; and I was told I must give five guineas to Lord Chetwynd's servant for bringing me my own carp out of my own canal in my own park!'"

Going back in his desultory manner, Walpole also relates the following of the preceding king:—

"Before I quit King George I., I will relate a story very expressive of his good-humoured presence of mind. On one of his journeys to Hanover his coach broke. At a distance in view was a château of a considerable German nobleman. The king sent to borrow assistance. The possessor came, conveyed the king to his house, and begged the honour of his majesty's accepting a dinner while his carriage was repairing; and, while the dinner

was preparing, begged leave to amuse his majesty with a collection of pictures which he had formed in several tours to Italy. But what did the king see in one of the rooms but an unknown portrait of a person in the robes and with the regalia of the sovereigns of Great Britain! George asked whom it represented. The nobleman replied, with much diffident but decent respect, that in various journeys to Rome he had been acquainted with the Chevalier de St. George, who had done him the honour of sending him that picture. 'Upon my word,' said the king instantly, 'it is very like to the frinily.' It was impossible to remove the embarrassment of the proprietor with more good breeding."

And with this we conclude our short review, leaving all the rest about these monarchs, their ministers, their mistresses, their courtiers, and their concerns, to be acquired from the narrative which has furnished us with these *moreaux*.

*A Disquisition on the Scene, Origin, Date, &c. &c. of Shakspeare's "Tempest."* In a Letter to Benjamin Heywood Bright, Esq., from the Rev. Joseph Hunter, F.S.A. 8vo. pp. 151. London, 1839. Printed by Whittingham. (One hundred copies only printed).

MR. HUNTER informs his correspondent, that having about two years ago announced, at the close of a book of antiquarian literature, the speedy publication of a work to be entitled "New Illustrations of the Life, Studies, and Writings of Shakspeare," he felt he had made a somewhat ambitious promise, which he was anxious honestly to perform. He found, however, that he had counted without his host—the booksellers, and instead of completing the task which he had meditated, he is obliged to content himself with offering *Illustrations of the Tempest*, only as a specimen of what his book would have been; just as Johnson gave his "Notes on Macbeth," as a specimen of his intended annotation on the whole of the plays. He has thrown his materials into the shape of a letter—always a most incommodious form for discussing critical questions—and in this essay rendered more unsuited by a distribution into chapters. The four opening pages, and many others, are in fact of no greater value than as affording scope for compliment to the Shaksperian seal and knowledge of the author's correspondent.

In the folio of Hemyng and Condeale, in which "The Tempest" originally appeared, it is the first play of the collection. Why it is so placed can only be matter of conjecture; for the player-editors do not appear to have been guided by any principle of arrangement. Mr. Hunter is an advocate for the early composition of the play, but, in general, it is considered to be among the latest; Malone assigning it, in his "Essay on the Chronological Order of Shakspeare's Plays," to the year 1611; and Chalmers, in his review of that Essay, to 1613. As there is no external information on the subject, its date must be ascertained by internal evidence, and that is but scanty. We have only the following points to guide us.—I. The mention of the "still-ver'd Bermoothes." II. Gonzalo's plan of a Commonwealth, given in the first scene of the second act, which is evidently taken, almost *verbatim*, from John Florio's translation of Montaigne's Essays. III. The similarity of the celebrated lines, "The cloud-capp'd towers, the gorgeous palaces," &c., to a stanza in Lord Sterling's tragedy of "Darius," one of which passages seems to have suggested the other. IV. The names of Trinculo and Antonio, which are to be found likewise in the comedy of "Al-

bumazar." V. The allusion to the exhibition of a dead Indian in England. To these may be added, that Ben Jonson, in his prologue to "Every Man in his Humour," when he sneers, among other things, at "the tempestuous drum" of rival dramatists, is supposed to have "The Tempest," which he elsewhere, in his "Induction to Bartholomew Fair," calls a drollery, in his mind; and that a great storm, which in the October, November, and December of 1612, happened in this country, and in the words of Stowe, "did exceeding great damage, with extreme shipwreck, throughout the ocean," may have induced Shakspeare to give the name of "The Tempest" to his play.

I. Some accounts of the Bermudas had been published before 1600; but they were more prominently brought to public attention by the wreck of Sir George Somers, and Sir Thomas Gates, in the Bermudean Seas in 1609, of which Sil. Jourdan published a narrative in 1610. In Hackluyt will be found the narrative of the shipwreck of Henry May in these seas, in 1595, and of Sir Robert Dudley's voyage towards the Bermudas in quest of the Havanna fleet, which he "found not, but foul weather enough to scatter many fleets." In Sir Walter Raleigh's "Discovery of Guiana," published in 1596, he describes the Bermudas as "a hellish sea for thunder, lightning, and storms." The Bermudas, therefore, and their tempestuous character, were known before the publication of Jourdan's pamphlet. The evidence is trifling on either side, but it appears more probable that Shakspeare applied the epithet "*still-ver'd*" to these stormy seas, after the greater notoriety of their character conferred upon them by the shipwreck of Somers and Gates, *i. e.* after 1610.

II. The allusion to Florio is unquestionable. The identical phraseology of the passages prohibits us from thinking that Shakspeare had it from the original Montaigne,—

"No kind of traffic  
Would I admit; no name of magistrate;  
Letters should not be known; riches, poverty,  
And use of service none; contract, succession,  
Bourn, bound of land, tilth, vineyard, none;  
No use of metal, corn, or wine, or oil;  
No occupation; all men idle, all,"

is plainly from Florio's, "It is a nation, I would answer Plato, that hath no kind of traffic, no knowledge of letters, no intelligence of numbers, no name of magistrate, nor of political superiority; no use of service, of riches, or of poverty; no contracts, no successions, no divorces; no occupation but idle," &c. We know, also, that Shakspeare had read the book, for a copy of it has been recently discovered, with his name written in it with his own hand. This volume which is described in the "Archæologia" by Sir Frederick Madden, vol. xxiii. pp. 112, 123, was bought by the British Museum for 120*l.*, being, as Mr. Hunter truly observes (p. 95), "without the autograph, worth about fifteen shillings." The date of the book is 1603; how, then, could "The Tempest," which thus borrows from it, have appeared in 1596, according to Mr. Hunter's theory? We shall leave it to himself to answer:—

"There are two ways of evading this difficulty. First, though we know of no earlier edition of this translation (and it is improbable that there is any earlier edition of it as a whole), it is by no means improbable that a portion of it may have appeared some years before in one of the smaller tracts of Florio, of which there were many, more perhaps than are now known to exist; and in that portion of it the passage in question may have occurred,

Or, secondly, this speech of Gonzalo's may have been added after the original appearance of the play, as there is reason to think was the practice of Shakspeare. Alterations he certainly made from time to time."

Some passages in other plays are cited as instances of change:—

"It might, then, be said that this passage, in which we have words of Florio, was superinduced some time after the play was publicly performed. But I propose to meet the difficulty, and not to evade it. It is true that no printed edition of this translation, or of any part of it, is known of an earlier date than 1603. But it is also certain that the translation was made several years before; for as early as 1599, license was granted to Edward Blount for the printing of it. And for proof that this is not the earliest period to which we can trace this translation, I have only to refer you to the Essays of Sir William Cornwallis, where you will find not only that the translation was made, but that it was divulged before that time. The first edition of these Essays, indeed, bears date only in 1600; but they were written some time before, for Henry Olney, a friend of the author, under whose care they were printed, assigns as the reason for publishing an authentic edition, that copies were in so many hands, there was danger lest the work might be printed by some dishonest person surreptitiously. How much time is to be allowed for this multiplication of copies in manuscript, and for the original composition of the Essays, it is impossible to estimate with much exactness; but it may fairly be allowed to conjecture that three or four years may have passed, which brings us near to the date we have assigned to 'The Tempest.' But in what year soever Cornwallis wrote his Essays, in or before that year had Florio made his translation of Montaigne. For thus writes the author:—'For profitable recreation that noble French knight, the Lord de Montaigne, is most excellent; whom, though I have not been so much beholding to the French as to see in his original, yet divers of his pieces I have seen translated, they that understand both languages say very well done; and I am able to say (if you will take the word of ignorance), translated into a style admitting as few idle words as our language will endure. It is well fitted in this new garment, and Montaigne speaks now good English. It is done by a fellow less beholding to nature for his fortune than wit, yet lesser for his face than his fortune: the truth is, he looks more like a good fellow than a wise man; and yet he is wise beyond either his fortune or education.' Florio's profession was that of a French and Italian master, in which he was the most eminent man of his time; and the portions of Montaigne in an English translation, to which Cornwallis alludes, may be supposed, with likelihood enough, to have been prepared by him for the use of his scholars. But being seen by Cornwallis, it is too violent a presumption that they may have been seen by Shakspeare also, especially as the Florios—for there were two, Michael-Angelo and John,—were noticed by the Herberts from the time when Michael-Angelo dedicated a work, now in manuscript in the Public Library at Cambridge, to Henry, earl of Pembroke, in 1553, to the time of the death of John Florio, in 1625, who leaves his corrections of the Italian dictionary published by him, to William, earl of Pembroke, whose connexion with Shakspeare is so remarkable a circumstance in the history of both? Shakspeare is even brought into imme-

diate connexion with Florio some time before the date which I have assigned to 'The Tempest.' I shall not repeat the argument of Bishop Warburton to prove that Florio is ridiculed in the 'Love's Labour's Lost,' under the character of Holofernes, nor enter now into the question whether he is so or no. But I would observe, that, supposing it was the intention of Shakspeare, for whatever reason, and it must have been a reason arising in the private relations between them, to hold up Florio to ridicule in that play; it is done, not in the character of Holofernes, the schoolmaster, taken singly, but Holofernes and Armado together make up John Florio. The proofs are indeed pregnant; for Florio, though undoubtedly he deserved well of the country that adopted him, and was perhaps a main instrument in introducing Italian writers to the notice of Englishmen, which did so much to raise the character of our literature and poetry, was in truth a somewhat vain, pedantic, and thrasonical person. However, without going further into this question, I think I have said sufficient to shew that Shakspeare may not improbably have seen portions of Florio's Montaigne in 1596."

We cannot see the pregnancy of these proofs. Shakspeare *might* have interpolated this passage in a later edition; he must, then, have interpolated the whole scene, which, without it, is very barren. It *might* have appeared in some unheard-of earlier work of Florio, which is, indeed, highly improbable. It *might* have been seen by Shakspeare in manuscript; for this sagacious reason, that as it had been shewn to the author's friends and admirers, it was likely that Shakspeare, who holds him up to personal ridicule (there is no doubt whatever that Florio is the prototype of Holofernes), was also favoured with a "private view." In spite, therefore, of these pregnant proofs, we look upon the passage as helping to fix the composition of "The Tempest" after 1603.

III. The "Darius" of the Earl of Sterline appeared in 1603. It is needless to quote Prospero's famous verses, or to point out their resemblance to the following from the third act of "Darius":—

"Let Greatness of her glassy scepters vaunt,  
Not scepters; no, but reeds, soon bruised, soon broken.  
And let this worldly pomp our wits enchant,  
All fades, and scarcely leaves behind a token.  
Those golden palaces, those gorgeous halls,  
With furniture superfluously fair,  
Those stately courts, those sky-encountering walls,  
Evanish all like vapours in the air."

This affords us but little help. It only proves, that if "The Tempest" were written in 1596, Lord Sterline followed Shakspeare—if, after 1603, that Shakspeare imitated Lord Sterline—and, therefore, leaves the question as it was. It is more likely, however, that Shakspeare, who made no scruple of appropriating to himself the ideas or the verses of minor dramatists, should have taken, with Lord Sterline, his not unusual liberty, than that Lord Sterline should have ventured upon the bold step of palpably imitating one of the most famous passages in the poetry of our language.

IV. The same may be said of the names of Trinculo and Antonio occurring in "Albazar." That comedy was printed in 1619, but is supposed by Dryden to have appeared some years before—not, however, any thing so far back as 1596. It is but a slight circumstance after all; but, as we have just said, it is more probable that Shakspeare should have used what he found in the less known dramatist, than the reverse.

V. The Dead Indian.—Hear Mr. Hunter:—"I must now dispose of Mr. Chalmers's dead

Indian. When Trinculo, in ridicule of the passion of Englishmen for seeing sights shewn to them by travellers, says, 'When they will not give a doit to relieve a lame beggar, they will lay out ten to see a dead Indian,' Mr. Chalmers tells us that he alludes to a circumstance which occurred as late as the year 1611. In that year the Earl of Southampton and Sir Francis Gorges brought to England five Indians, four of whom left England alive some time after. Mr. Chalmers adds, 'We may easily suppose of the other that he died in London, and was exhibited for a show.' Undoubtedly we may: but evidence exists that an Indian died in London many years before, and, not indeed, that his body was exhibited for a show, but that a wax model of his body was made after his death, no doubt for the purpose of being publicly exhibited. This unfortunate being, the account of whose capture cannot be read without a strong feeling of indignation against so unfeeling a use of that higher power which civilisation gives, was brought to England by Frobisher, in 1577. In the accounts of the expenses of that voyage, which have been printed by the late commissioners on the public records, whose works assist in inquiries in the grander subjects of historical research, and in the lighter literature of such a work as this, the following entry occurs:—'Paid William Cure, Ducheman, graver, for making a mould of hard earth of the Tartar man's image, to be cast in wax.' The body itself was embalmed and deposited in a coffin."

If the Indian died in 1577, he must have been a stale subject, indeed, in 1596; and Shakspeare would not have failed to notice his representation in wax. Chalmers's Indian is far more probable.

VI. Ben Jonson's Prologue to "Every Man in his Humour" is pressed into Mr. Hunter's service very earnestly:—

"There is no room (he says) to question that 'Every Man in his Humour,' was his first play; and the notice of it in Henslow's book, in November 1596, shews that it was then in existence. This play is introduced by a prologue, in which, as it seems to me, there is much matter bearing on the present inquiry. Mr. Gifford, indeed, contends that there is no sufficient evidence that Jonson alluded to Shakspeare, in the satiric strokes with which that prologue abounds. I, on the contrary part, am ready to maintain, that it is quite incredible that there should be so many strokes by which Shakspeare is hit, and yet that not one of them should be intended to fall upon him: and that it is also incredible, that there should be in that prologue so many strokes which admit of being interpreted as blows aimed at 'The Tempest' in particular, and yet that none of them were intended for it. Especially, as it is evident that Jonson began his dramatic career with the intention of reforming the English stage, and bringing the English drama nearer to the models of antiquity. Jonson set up in his own mind Plautus as the writer to be followed in comedy, and Seneca in tragedy. He was, therefore, by his principles bound to seek to banish from the stage the kind of plays with which Shakspeare was at that period delighting the public, the histories and the romantic dramas, and to endeavour to substitute for them comedies, in which the humours of men were exhibited as men then were, or stately tragedies, with no mixture of what is comic. Nor, whatever may be thought of the bearing of this prologue, can it be denied that Jonson does pointedly, in another place,

direct his satire against this very play of 'The Tempest': 'Such as heget Tales, Tempests, and such like drolleries.'"

He then proceeds to express his disbelief of the ridiculous notion that Jonson was actuated by any mean passions of envy or jealousy against Shakspeare:—

"The flouts and girds which one dramatist is found casting out against another, may often be referred to the intention of keeping up the spirit of the theatre, or may be likened to the sarcasms heard at the bar passing between persons who, when they have left the court, are the best friends imaginable. When Jonson wrote the prologue which has led to these observations, his play was to be produced at the theatre called the Rose, while 'The Tempest,' and the rest of Shakspeare's plays, were exhibited by his own company at the Globe, and the theatre in the Black Friars. The language of the prologue may easily be interpreted thus, in perfect consistency with that good feeling which, I believe, to have ever existed between them: 'Our rivals at the other house are attempting impossibilities, or are degrading the stage by the introduction of masques and monsters. We mean to shew you, in the production of a new poet, what comedy ought to be, and what we design to make it.' This, in addition to the sober judgment of Jonson, who was doubtless sincere in his preference of the classical to the romantic drama; for that, after all, was the question between them. But I must no longer withhold from you the prologue itself, and the remarks which I have to make upon it:—

Though need make many poets, and some such  
As art and nature have not bettered much,  
Yet ours for want hath not so loved the stage,  
As he dare serve the ill customs of the age,  
Or purchase your delight at such a rate,  
As, for it, he himself must justly hate:  
To make a child now swaddled, to proceed  
Man, and then shoot up, in one beard and weed,  
Past threescore years: or, with three rusty swords,  
And help of some few foot-and-half-foot words,  
Fight over York and Lancaster's long jars,  
And in the tying-house bring wounds to scars.  
He rather plays you will be pleased to see  
One such to-day, as other plays should be;  
Where neither chorus waits you o'er the seas,  
Nor creaking throne comes down the boys to please:  
Nor nimble squib is seen to make a feat.  
The gentlewomen: nor rolled bullet heard  
To say, it thunders: nor tempestuous drum  
Rumbles, to tell you when the storm doth come.  
But deeds and language, such as men do use,  
And persons, such as Comedy would choose,  
When she would shew an image of the times,  
And sport with human follies, not with crimes.  
Except we make them such, by loving still  
Our popular errors, when we know they're ill.  
I mean such errors as you'll all confess,  
By laughing at them, they deserve no less:  
Which when you heartily do, there's hope left then,  
You, that have so graced monsters, may like men."

Neglect of the unities, the introduction of beings not human, the attempt at representations for which the theatres were inadequate, are the general points of attack. The special points are these: (1) The same play exhibiting a character in infancy and age: (2) The wars of York and Lancaster: (3) The removing the scene to a distant country by means of a chorus: (4) The descent of a creaking throne: (5) Thunder and lightning: (6) Monsters. Now, within the scope of these objections, Shakspeare obviously stands; and the utmost that can be said by those who would defend Jonson from the charge of having here made an attack upon Shakspeare is this, that he alone was within the scope of these objections, but that other dramatists stood so with him. But when of the special points of attack we find the three last in 'The Tempest,' it can hardly, I think, be reasonably doubted, that that particular play was in the view of Jonson

when he wrote the prologue. The 'Monster,' must be Caliban 'graced' as he has always been by the favour of the multitude, nor graced unworthily. The 'creaking throne,' is the throne of Juno, as she descends in the masque; the 'nimble squib,' is the lightning during the storm, with which the play opens; and the 'tempestuous drum,' is the thunder which accompanied the lightning. But observe, I beg you, the word *tempestuous*:—

"Nor tempestuous drum  
Rumbles, to tell you when the storm doth come:"  
corresponding to the stage direction for the first scene of this play, as originally printed: 'A tempestuous noise of thunder and lightning heard.'"

Unfortunately for all this reasoning, the creaking throne, and the thunder and lightning and the monsters,\* might apply to many an, other play—to "Macbeth," for instance, where, too, we have the drum very pointedly alluded to; and, besides, although "Every Man in his Humour" was produced in 1596, this prologue was not published until 1616, when it first appeared in the folio edition of Jonson's works. It was not published in 1601, for the play was then printed without it; and it is apparently written, not so much as a prologue to one particular comedy, as a defence of Jonson's whole course of dramatic writing. It is probable that it was written expressly for this edition of his collected works.

On the whole, then, we may conclude, that as the "storm-vexedness" of the Bermudas was brought under general notice in 1609 by the shipwreck of Somers (which gave them a name by which they were sometimes known, the Somers Islands), and the narrative of Jourdan, in 1610; as a remarkable storm called every one's attention to the subject of tempests in 1612; as Florio's book, which we may almost say is quoted in the play, appeared in 1603; as it seems improbable that Lord Sterline, in 1603, should borrow the verses, or the author of "Albumazar," some years before 1614, according to Dryden, say 1608, should adopt the names, of "The Tempest," and no improbability whatever existing in the contrary supposition, viz. that Shakspeare borrowed from them; as it is likely that a dead Indian was an object of Cockney curiosity in 1611; and as Jonson's prologue, so far from originally appearing with the play to which it is prefixed, did not appear until twenty years after, viz. in 1616, when, if intended as a gird at Shakspeare at all, it must be taken as a satire on his whole career then ended, beginning with his York and Lancaster plays, confessedly his earliest, and concluding with a fling at "The Tempest," which might, therefore, be looked on as the last in Jonson's catalogue—we hold to the opinion that it is among the latest of the plays. Into the controversy between Malone and Chalmers as to the dates 1611 or 1613, there is no necessity for entering. At all events, Mr. Hunter's chosen date, 1596, has nothing to recommend it.

In fact, he adduces but two points in its favour. After observing that Shakspeare is fond of alluding to topics of the day, he asks, What was it that most engaged the attention of the people of England in the spring and summer of 1596? and answers that it "was the return of Sir Walter Raleigh and his companions from the expedition to Guiana, and the very extraordinary reports which they

\* Monsters in Ben Jonson, however, appear to mean not such creatures as Caliban, but monstrous characters; i.e. characters whose crimes, not whose human follies, as he says a few lines above, are brought upon the stage. Bloody plays were marvellous favourites with our ancestors.

made of what they had seen and heard. The expedition was performed in the year 1595; and early in 1596 appeared the pamphlet of Raleigh, in which he gave an account of what they had done, seen, and heard; a pamphlet which would excite wonder indeed, and would tempt cupidity, but which could not, I will venture to say, but make his judicious friends grieve. The very title is enough to condemn it, boastful and ridiculous: 'The Discovery of the large, rich, and beautiful Empire of Guiana, with a Relation of the Great and Golden City of Manoa (which the Spaniards call El Dorado), and the Provinces of Emeria, Arromaia, Amapaia, and other Countries, with their Rivers adjoining. Performed in the year 1595, by Sir Walter Raleigh, knight, Captain of Her Majesty's Guard, Lord Warden of the Stannaries, and Her Highness's Lieutenant-General of the County of Cornwall.' Such is the title which ushers us to a book stuffed with the most improbable reports, quite sufficient to bring the author within the class of travellers satirised in this play, who 'mistake the truth,' and deal in 'vouched rarities' which are 'beyond credit.' We shall soon shew that there are special points in which this pamphlet of Raleigh's is attacked; but, were there no such specialities, we should regard the general truth that there is so much ridicule in this play of travellers' wonders, of foreign plantations, new schemes of government, and the like, as no mean proof that it appeared at no great distance of time after this pamphlet, because there was no other book of travels which, in the time of Shakspeare, excited so much the public attention as this, or which was so open to ridicule, and yet, in some points of view, so dangerously misleading. We do little justice to Shakspeare if we regard him only as one who ministered to the public entertainment on the stage and in the closet. He ever looked, I believe, to the best welfare of his countrymen, and exerted himself to promote it, by correcting popular delusions, and diffusing just sentiments among them; and a book which held out the tempting prospect of unbounded wealth, which seemed to require only that a hand should be stretched out to grasp it, was a dangerous experiment on popular credulity, which it was worthy such a master-hand as Shakspeare's to seek to counteract. Raleigh, too, was no favourite with Shakspeare, or rather with the political party to which Shakspeare belonged. Shakspeare was of the Essex faction, to which his patron, the Earl of Southampton, was, for himself so unfortunately, attached. Shakspeare's company represented the deposition of King Richard the Second, on the day before the insurrection, at the special request of Sir Gilly Meyrick. Shakspeare has a beautiful compliment to Essex, in his 'King Henry the Fifth,' and a biting gird at Cecil, and possibly also at Mountjoy, in the 'Much Ado.' Is it, then, surprising that he should not omit such an opportunity of attacking Raleigh? But he does it fairly and honourably, in the manner of a dramatist, it is true, but not exaggerating Raleigh's faults and follies. He does not insinuate dishonesty of purpose. His satire is confined to the gross improbability of his statements: and, looking again at the pamphlet, which I happen to possess in the original edition, I see no reason to charge Raleigh, as Hume has done, with having circulated these delusive accounts with a fraudulent intention; but neither can I at all agree with Mr. Fraser Tytler in the estimate which he has taken of this tract. Raleigh seems to me to fall justly within the scope of Shakspeare's

censure. I cannot find that he makes the distinction, of which Mr. Tytler speaks, between the things he saw and the things he heard, but has given to the things which he only heard the full weight of his own personal authority, or at least circulates them with the credit of his own full belief. Camden, the learned, the wise, the candid, and the just, whose fine character I can never contemplate but with the highest delight, has spoken of this tract in a manner which becomes his high reputation, and hints at the true source of the mistakes, 'the sanguine completion of Raleigh's own hopes and desires.' As 'The Tempest' did not appear till after the publication of Raleigh's pamphlet, Shakspeare is not to be regarded as one of those of whom Raleigh, in his dedication to the lord admiral, so bitterly complains. But I have not yet given you the special proof that this tract of Raleigh's is the subject of Shakspeare's ridicule in this play. Turn then to a speech of Gonzalo, in the third scene of the third act, in which these lines occur:

'Or that there were such men  
Whose heads stood in their breasts? which now we find  
Each putter out on five for one will bring us  
Good warrant of.'

Now, compare Raleigh: 'Next unto Arui, there are two rivers, Atoica and Caora, and on that branch which is called Caora are a nation of people whose heads appear not above their shoulders, which, though it may be thought a mere fable, yet, for mine own part, I am resolved it is true, because every child in the provinces of Arromaia and Canuri affirm the same: they are called Ewaipenoma: they are reported to have their eyes in their shoulders, and their mouths in the middle of their breasts.' P. 70. There is more about them. He asserts, in another part of his book, his entire belief in the story; and in his enumeration of the several nations at p. 91, he writes seriously, thus: 'To the west of Caroli are divers nations of cannibals, and of those Ewaipanoma without heads.' The reader will judge whether the improbable parts of his narrative were not his own. Where was his anatomy? Where his philosophy? Shakspeare alludes again to the 'men whose heads do grow beneath their shoulders' in 'Othello'; and he returns to the attack upon Raleigh's discreditable pamphlet in 'The Merry Wives of Windsor,' which immediately succeeded 'The Tempest,' or at least appeared very soon after it: 'She is a region of Guiana, all gold and bounty.'

Am I then presuming beyond what the evidence justifies, in referring 'The Tempest,' not, with Mr. Malone, to 1611, or Mr. Chalmers, to 1613, but to the summer of 1596, when the excitement produced by Raleigh's publication was at its height?

Never, certainly, was presumption raised upon slighter foundation. If this remarkable specialty of Gonzalo's slight allusion to the men whose heads stood in their breasts be sufficient to prove that 'The Tempest' followed hard upon Sir Walter Raleigh's "Discovery of Guiana," we have stronger reason for assigning Othello's more detailed description of the marvels of his travels' history to the same date. But in many of the plays travellers' stories are made the object of ridicule; and the new schemes of government laughed at by Gonzalo and his companions refer not to Raleigh, but to Florio or Montaigne. It is, besides, a somewhat strange way of correcting popular delusions to exhibit a scene of wonders performed by the magic of Prospero in a desert isle, peopled almost exclusively by spirits of the air; and his belief in the power of Shakspeare

must be unbounded, who imagines that the airy poetry of "The Tempest" was intended to convey political instruction, or that it contributed to counteract the spirit of adventure among his contemporaries. There is something absolutely droll in Mr. Hunter's assuring us that Shakspeare's satire on Raleigh was so fair and honourable that he merely attacks Sir Walter's faults and follies, and does not insinuate dishonesty of purpose. This, no doubt, is exceedingly kind on the part of the poet,—but the main question is, Did he attack him at all? Raleigh himself, we should think, would be excessively puzzled to find any cause of quarrel in "The Tempest;" and we defy the most dexterous of special pleaders, or Queen's Bench attorneys, to frame out of it an innuendo of libel.

What Shakspeare's particular politics, in the dangerous times in which he lived, might have been, it is impossible now to say. Except profound devotion to Queen Elizabeth, which was as much the romantic as the political fashion of the day, and a fine compliment to Essex when high in her favour, we have scarcely any thing specific to allow us to form an opinion. It is probable that he sedulously avoided taking part in them at all. That he was concerned in any thing so foolish as representing the deposition of Richard II. on the day before Essex's insurrection is a mere absurdity, which Mr. Hunter should not have insinuated. Sir Gillie Meric, who was concerned in what Dr. Farmer calls that "hare-brained business," gave Phillips the player forty shillings to perform the play of "Henry IV."—not Shakspeare's, be it remarked, but a play which, in the State Trials, we learn that the players objected to perform, because it was stale ["*Exoletam tragediam de tragica abdicatione regis Ricardi Secundi*"] it is called by Camden,]—in which the killing of the king, i.e. Richard II. was represented. But how does this prove that Shakspeare had any thing to do with it, as Mr. Hunter seems to wish us to believe by mentioning the story? Augustine Phillipps was certainly one of the patentees of the Globe Theatre with Shakspeare in 1603—a couple of years after the execution of Sir Gillie and his friends. It by no means follows, that in 1601 he had the command of "Shakspeare's company."

We may, then, safely dismiss Raleigh from our consideration. The only other proof of "The Tempest" having appeared before 1598 is rather of a comical description. In that year Francis Meres published in a work entitled "Palladis Tamia; Wit's Treasury, being the Second Part of Wit's Commonwealth," a list of twelve of Shakspeare's plays, and among them "The Tempest" is not. Now this absence has hitherto, and one would think reasonably enough, been regarded as unfavourable to the earlier date of "The Tempest." Mr. Hunter valiantly contends that it is *strong* in favour of that opinion. The passage in Meres is as follows:—

"As Plantius and Seneca are accounted the best for comedy and tragedy among the Latins, so Shakspeare among the English is the most excellent in both kinds for the stage; for comedy, witness his 'Gentlemen of Verona,' his 'Errors,' his 'Love's Labours Lost,' his 'Love's Labours Won,' his 'Midsummer Night's Dream,' and his 'Merchant of Venice'; for tragedy, his 'Richard the Second,' 'Richard the Third,' 'Henry the Fourth,' 'King John,' 'Titus Andronicus,' and his 'Romeo and Juliet,' p. 282."

On which Mr. Hunter remarks, that although

"The Tempest" does not exist *eo nomine* in Meres's list, it is there under the title of "Love's Labours Won," and gives himself some trouble to prove Dr. Farmer's conjecture, that by this name, "All's Well that Ends Well" was intended, to be destitute of foundation:—

"But if not to the 'All's Well,' to what play of Shakspeare's was this title once attached? I answer, that of the existing plays, there is only 'The Tempest,' to which it can be supposed to belong: and so long as it suits so well with what is a main incident of this piece, we shall not be driven to the gratuitous and improbable supposition that a play once so called is lost.

\* Enter Ferdinand, bearing a log:

Ferdinand. There be some sports are painful, and their labour  
Delight in them sets off; some kinds of baseness  
Are nobly undergone; and most poor matters  
Point to rich ends. This my mean task  
Would be as heavy to me as odious, but  
The mistress which I serve quickens what's dead,  
And makes my labours pleasures: O, she is  
Ten times more gentle than her father's crabbed;  
And he's composed of harshness. I must remove  
Some thousands of these logs, and pile them up,  
Upon a sore injunction: my sweet mistress  
Weeps when she sees me work; and says, such baseness  
Had never like executor. I forget:  
But these sweet thoughts do even refresh my labours."

Act iii. sc. 1.

Again:—

\* For your sake  
Am I this patient log-man."

And Prospero afterwards tells him:

\* All thy vexations  
Were but my trials of thy love; and thou  
Hast strangely stood the test."

Act iv. sc. 1.

Here then, are the *Love Labours*. In the end they *won* the lady

\* So perfect and so peerless."

If you resist this evidence, I may inquire, What other play in your opinion was meant? I suspect that the play had originally a double title, 'The Tempest' or 'Love Labours Won'; just as another of the plays had a double title, 'Twelfth Night, or, What you Will.' Meres may seem to have chosen to call it by the second title, for the sake of the opposition to the title of the play which he had named immediately before it, the 'Love Labours Lost.'

He then winds up this part of his argument with the triumphant conclusion that

"On the whole, then, I submit that we have Meres's testimony to the existence of 'The Tempest' as a play of Shakspeare, in 1598."

So that, because Meres says nothing about "The Tempest" at all, and because Ferdinand's having won Miranda after a couple of hours' courtship, must be considered as a striking instance of "Love's Labours Won," we have Meres's testimony to the existence of "The Tempest" as a play of Shakspeare in 1598. The deuce it must! If we resist this wonderfully convincing evidence, we are asked, What other play was meant? We answer, half a dozen, at least, might have been as well as "The Tempest." Might it not have been the *second* title of "All's Well that Ends Well?" a supposition that will render Mr. Hunter's objections to Farmer's conjecture of no moment.

Coleridge, in accordance with a somewhat fantastic poetical theory of his own, by which he dated Shakspeare's plays, classed "The Tempest" among the earliest. Such fancies are rather too metaphysical to be relied upon. Another poet, Campbell, has given his reason for considering it one of the very last.

"The Tempest," he says, in his remarks on the life and writings of William Shakspeare, prefixed to his edition of the plays, "has a sort of sacredness as the last work of the mighty workman. Shakspeare, as if con-

scious that it would be his last, and as if inspired to typify himself, has made its hero a natural, a dignified, and benevolent magician, who could conjure up spirits from the vasty deep, and command supernatural agency by the most seemingly natural and simple means. And this final play of our poet has magic indeed; for what can be simpler in language than the courtship of Ferdinand and Miranda, and yet what can be more magical than the sympathy with which it subdues us? Here Shakspeare himself is Prospero, or, rather, the superior genius who commands both Prospero and Ariel. But the time was approaching when the potent sorcerer was to break his staff, and to bury it fathoms in the ocean—

• Deeper than did ever plummet sound.

That staff has never been, and never will be, recovered."

We are not a little inclined to concur in the view of the case so eloquently put forward by Campbell, and we think some other circumstances could be adduced from the play, to corroborate his opinion, but we shall not enter into that question here. We have only to say, that Mr. Hunter has not overthrown a single argument adduced to prove the late date of the composition of "The Tempest," nor brought forward any thing worthy of the slightest notice to enforce his own position of the date of 1596.

So far, then, he has not kept the promise of his "ambitious title." We have nothing new in this part of his *Illustrations of Shakspeare*. As our article has, however, outstepped ordinary limits, we must defer, until our next appearance, the disquisition, whether he has been more fortunate in assigning a place, than he has been in selecting a date, for "The Tempest."

*A Winter in Iceland and Lapland.* By the Hon. Arthur Dillon. 2 vols. 12mo. London, 1840. Colburn.

MR. DILLON seems to be fonder of very cold weather than we are, and almost to measure the pleasures of travelling by the inconveniences and discomforts to which the traveller is exposed. In his first volume he gives us his experiences of Iceland, including a visit to the Geysers; and in his second, the details of a journey across Lapland to the 70th degree. The rest is made up of *re-vistas* of early history, ancient religion, sorcery, and other Scandinavian topics, which have been handled in a hundred different ways by a hundred different writers. In his more modern passages, our author goes over some of the grounds pre-occupied in so lively a manner by Mr. Barrow, in his short but entertaining tour a few years ago; and, what with the old and the new, we find nothing for our critic-trade but to select as much of the latter as may exhibit the nature of the publication, and afford a quarter of an hour's variety to our readers. To begin; the domestic economy of the Icelanders is thus described:—

"In giving a sketch of the occupations and domestic economy of the Icelanders, the account must chiefly be limited to the consideration of them as an agricultural community; for, in a country in which a population under 60,000 is dispersed over an extent equal to that of Ireland, it cannot be expected that many can confine themselves to distinct trades, or that much beyond the cultivation of a small portion of the soil can be undertaken. We accordingly find that, with the exception of a small number, who form the clergy and magistracy, the whole

of the people are peasants, dependent either on agriculture or fishing; and even as regards these two solitary professions, their followers are, in many cases, obliged to add farming to their other occupations, to enable them to earn a moderate subsistence. Yet, though the tilling of the land is the ostensible pursuit of all, many of the peasants, when at leisure, turn their attention to some handicraft, and employ their time in winter in constructing those few field implements which are of a form peculiar to the country, and therefore not imported. The farms are mostly occupied by the landowner, and, in cases where rented, an annual payment is made by the tenant,—a part in butter, and the remainder in money, based on the number of 'fiording,' or ten pounds' weight of that article, which can be produced on the farm. Indeed, butter and fish are very generally used as a standard of value in most transactions between the peasants: wages to servants are usually paid in the former, and in the latter are computed the taxes due to the king. There is a fixed standard of size for the fish, without which the Sysselman will reject them; as the deficiency, arising from bad condition, or any other cause, will have to be made good to him.

"The only portion of this extensive island from which profit is derived, or to which any idea of property is attached, consists of the long valleys and plains which run between the lesser mountains on the sea-coast. The centre is a vast desert, covered with 'Jökuls,' a name used to distinguish mountains perpetually clad in snow; these extensive glaciers forbid the approach of man, for as even the land at their bases is too elevated to admit of the growth of grass, the greatest obstacle is placed in the way of penetrating among them, in the shape of want of forage for the horses necessary to the undertaking. In travelling from the south to the north coast, a track is selected which avoids these mountains as much as possible; but even this pass will take up thirty-six hours, during which time the horses must continue without any food whatever. In summer this part of the journey is usually got over with as little delay as possible; but in winter it must often be accomplished on foot, from the depth of snow precluding the use of horses. Sledges are not in use in Iceland, the country being too mountainous, and the weather too stormy. Nor did I see more than one pair of snow-shoes while among these people. In form they differed materially from those used by the North American Indians, and in my opinion not so well calculated for supporting a weight, as they were made of one piece of wood, about four feet long, and very narrow, with the points turned up. The pair I saw belonged to a man who had brought the mail from the north,—a journey which is often, in winter, attended with danger, not merely from the excessive cold, but from the sudden drifts of snow that overtake, and but too often overwhelm, the traveller, who finds sufficient impediments to his progress in the darkness that shrouds him for twenty out of twenty-four hours. Yet I have heard it asserted that there are people living among the Jökuls, and that smoke seen in the distance is supposed to issue from their dwellings. Though I have heard this from more than one person, I can hardly give credit to the tale of any one having chosen such a residence; and attribute the whole to a popular belief that a band of robbers, who had fled at different times from justice, have selected this part of the country as a retreat, in which they can defy pursuit, and form a society of

their own, unrestrained by laws human or divine.

"Huddled together in a small apartment, usually the loft, without stove or any warmth but that arising from the confined atmosphere, and the packing of twelve or fifteen persons in a place of just sufficient capacity to contain their bulk, the family continue their labours till a late hour in the night, often till two and three in the morning, enlivened by listening to one of the party who chants some saga out of a book by the light of a dim seal-oil lamp. At times the monotony of the single voice is relieved by a hymn, the kind of music most relished by the Icelanders, in which the whole family join. Occasionally they indulge in instrumental music, and the longspell is taken down from the wall to serve as an accompaniment to their mournful ditties. This is the only musical instrument known among them, and is by no means calculated to enliven their spirits; indeed, if its gloomy tones are capable of producing any effect, I should say that it is that of instilling a black melancholy into the mind. In form it is a mere oblong tapering box, about two feet long and three inches wide, terminating somewhat like the head of a fiddle, and played upon with a violin bow. When in use it is laid upon a table, and the forefinger is applied only to the outer one of its three steel wires; and were it not for this difference, it would give one the idea of a guitar in a rapid state of decline. Besides this mode of recreation, it is rare to enter a house that is not provided with a considerable number of books, in the selection of which, as in other matters, the seriousness of their national character is displayed; as, besides the old Norse poems and sagas, works of a devotional tendency are almost always to be met with. Yet, notwithstanding the universal attention paid to religion, which is remarkable, there appears no fondness for ostentatious display of that kind, nor do any set up claims to superior sanctity. In every family the morning work is commenced, and the evening concluded, with a prayer, in which every member joins; the fishing-boat is not launched before the 'formadur,' or chief, has implored Divine protection for the crew while they remain at sea; nor even in travelling will an Icelander commence his day's journey before he has covered his face with his hat, and repeated a short supplication that he may accomplish it in safety."

Such are the principal habits related of this simple, and we add rude people, when we copy the following:—

"The article of food that is most prized is the flesh of the 'haukall,' a species of dog-fish or shark that abounds on the coast of Iceland. Before it is fit for use it must have been buried for a couple of years in the sand; when arrived at a state of maturity by this inhumation, it is said to resemble pork in flavour, but is so offensive as to render it impossible to approach a person who has tasted the least morsel of it for three weeks before. This, however, is not considered a sufficient reason for rejecting it, and I may say that, on the whole, they display as great a love of *haut godt* as any aldermanic epicure; whether reindeer's meat or skait engross their attention, a few weeks' wind-drying is all that is considered necessary to either. If it were not ill-natured, they might also be accused of eating horse-flesh, though it is but justice to say that the preference shewn to the latter food is confined to certain places, and has gained for these persons the name of 'Hross eiter,' or horse-

eat, which is looked upon as a term of special reproach."

Upon their general character, Mr. Dillon remarks:—

"I should say gloom prevailed to a great degree, and certainly the first impression on a stranger's mind will not be favourable to them. His patience will often be put to the test by their dilatory habits, and his temper will be further tried by their manners, many of which are very disgusting; such as transferring milk from one bottle to another through the medium of their mouths, and several other customs too offensive to be particularised; but he will find much honesty, and wish to oblige when it is in their power. Their hospitality should rather be measured by their wish, than their ability to treat guests well. Of pride they are by no means deficient, and they add to it a great degree of stubbornness, which they mistake for independence; and though rarely warm, they are always courteous in their manner. As regards their intellect, they are above mediocrity, and only want room to exercise their talents, which cannot be denied them, when we call to mind that the first living sculptor, Thorwaldsen, is an Iclander."

In the trip to the boiling Geysers, we find nothing of sufficient novelty or interest to justify extract; but must notice the state of literature:—

"Vidoe is interesting as being the place from which all the literature of the country is disseminated, for it contains the only printing-press now existing in Iceland. The art was first introduced, at the time of the Reformation, by Jon Arason, bishop of Holum, one of its most strenuous opposers, who hoped, by the aid of typography, to check the change of opinion which was gaining ground. He accordingly brought over a Swede, who superintended the establishment of a press in Nordland, which helped to overthrow its founder and the supremacy of his religion in that quarter; for among the first books that were issued from it was an Icelandic version of the Bible, by Gulbrand Thorlakson, in use to this day. It must have been sufficient for the literary wants of the country, for, till the middle of the last century, no attempt at a rival establishment was made; and when at length a second press was set up, in Hrappsey, an island in Breidford, a very inconsiderable number of books appeared from it, and a society, called 'Islenska Bokmenta Felags,' or the Icelandic Book Society, purchased both, and united them at Leira, in Borgarfjord. Subsequently, Magnus Stephenson, the principal promoter of the society, on his removal to Vidoe, transferred the press to the latter place, where it now remains, rented from the Bokmenta Felags by his son."

The account of the eider-ducks here (Stephenson's printing-house) is rather particular and curious. We are told:—

"The whole of the hill to the west of the house was strewn with nests of ducks. So much do these interesting birds feel their security in Vidoe, that five of them had chosen as their location the ground under a narrow bench that runs along the windows of the house; and so perfectly fearless were they, that, without moving away, they would peck at the hand that disturbed them. The rising ground is particularly favourable for the birds to build on, being covered with hollows and inequalities, that serve to protect them from the weather, and only require the addition of down to convert them into nests. The drakes

are easily known by their white and black plumage; but the dark hue of the females makes it difficult to distinguish them from the holes in which they sit. Owing to their lying close, I have frequently trodden on them, without their warning me of their presence till the mischief was done. The drakes, though by no means wild, will not allow themselves to be handled so freely as the ducks, and mostly keep together on the top of the hill. As soon as a nest is completed, it is usual to remove the greater part of the down, while the bird is away feeding; and this operation is repeated a second, and occasionally a third time. On her return, the bird makes up the deficiency thus created by stripping her own breast; and, when her stock is exhausted, she calls on her mate to add his portion, which will bear no comparison with the sacrifice she has made. The same sort of spoliation is practised with regard to the eggs, care being taken that three or four are left; for should the bird on her return find the nest empty, she will desert it, and not breed again the same season. About six, considerably larger than those of tame ducks, and of a light green colour, are found in each nest. Their flavour is very inferior to that of hens' eggs, but they are not so strong as to prevent their being made into omelettes. The average quantity of down obtained from three nests is half a pound, so mixed with grass and foreign matter, that forty pounds in that state are reduced to fifteen, after it has been thoroughly cleaned. Vidoe and Engoe together produce, I believe, about three hundred pounds weight yearly; which would, if the above calculation is correct, make the number of ducks that come to these two places fall not far short of ten thousand every year. The number, however, that breed in Faxefjord is small compared to those that bend their course to Breidford. The innumerable little islands that fill that bay afford ample shelter and security to eider-ducks, who seem to avoid nothing so much as any place accessible to foxes. These cunning animals are particularly fond of their eggs; but, though we will give them all credit for ingenuity in getting at them, we can hardly be expected to put much faith in the story told about them by the Danish travellers, Olavson and Paulson. When, say they, the Icelandic foxes have detected any crows' eggs in an inaccessible place, they take one another's tails in their mouths, and form a string of sufficient length to reach the nest, and let one end of it over the rock. They have, however, forgotten to tell us how the eggs are passed up by these craftiest of Reynards. The separation of the down from the grosser feathers and straws occupies the women during winter. It is then thoroughly divested of particles too minute for the hand to remove, by being heated in pans, and winnowed like wheat. Should it become matted and dead, it is again subjected to a brisk heat, which restores its original elasticity, and increases its bulk. As in the case of ostriches, the down taken after death is inferior to that which the living duck tears from its breast, which prevents their destruction through wantonness. They are besides protected by the law, which punishes the shooting of them by a pecuniary penalty, and the forfeiture of the weapon used. Nor are guns allowed to be fired in the neighbourhood during their sojourn; and even the corvette that brought the prince abstained in the spring from saluting him."

Having devoted as much of our space as the subject demands to the Icelandic portion of the

work, we shall confine our Lapland illustration to a single extract, which exhibits the resting-place, or northern caravanserai appropriated to gentlemen who choose to traverse the mountainous country with Lapp drivers and reindeer turns out; but which, however, we must defer for a week.

#### WOOD ENGRAVING IN FRANCE.

[Fourth Notice.]

*Les Mille et Une Nuits.* (The Arabian Nights, with 2000 Illustrations.) 4 vols. 8vo. Paris, Bourdin.

*Histoire de l'Empereur Napoléon.* (With 500 Illustrations, designed by Horace Vernet.) 8vo. Paris, Dubochet.

*Histoire de la Révolution Française, par Mignet.* (Designs by Raffet, &c.) 8vo. Brussels.

*Versailles, Ancien et Moderne, par le Comte Alex. de Laborde.* (800 Illustrations.) 8vo. Paris, Everat.

*Lettres d'Héloïse et d'Abailard.* (Illustrations by Gigoux.) 2 vols. large 8vo. Paris, Houdaille.

THE French illustrated edition of *The Arabian Nights* contains many bold and fine cuts, which we believe are *clichés*, or casts, from German blocks. But in our opinion, as a whole, it is much inferior to the English edition of the same work published by Charles Knight. The beautifully delicate engravings and the charming sketches of Eastern scenery which embellish the latter, accord much better with the airy character of the work, than the strong and sometimes coarse figures of the French edition. The chief defect in the English cuts is the want of expression in the faces. As we have observed before, it is difficult in illustrating such a book to avoid a certain disagreeable character of sameness.

From illustrating the standard works of the national literature, the Parisian booksellers have proceeded to make books to be illustrated. The most popular of these works is the *History of Napoleon*, the text written by M. Laurent, with 500 designs from the pencil of Horace Vernet. Many of the woodcuts in this book are admirably executed. They are distributed in the pages much in the same manner as the embellishments of "Gil Blas" and "Don Quixote." We give two specimens. The first represents the emperor, on the 8th May, 1805, visiting the field of battle of Marengo, in the same dress which he had worn in the engagement. It is engraved by Rouget. The second, from the workshop of Andrew Best and Leloir, represents Murat's dragons driving the Austrians from the bridge of Leck, on the 7th of October in the same year, at the beginning of the campaign which was signalled by the decisive battle of Austerlitz.

The illustrated edition of Mignet's *History of the French Revolution*, published at Brussels, is got up in precisely the same style as the *Life of Napoleon*, and is professedly intended as a companion to it.

The *Historical Guide to Versailles* is embellished very richly and very tastefully. No work of a similar character presents so agreeable a variety of design, either in subject or form, as this. Landscapes and gardens, bridges and railroads, palaces and cottages, battles, processions, familiar scenes, portraits, fancy sketches, &c. &c., are crowded on every page, sometimes as large pictures, sometimes as borders, and at other times as initial letters, side and tail-pieces, &c. Names of English engravers occur frequently, particularly that of Orrin Smith. We have many neat landscape

sketches engraved by Adolphe Best. Nobody who has visited Versailles should be without this book; the interest of those who have yet to visit it will be doubly excited by possessing it.

We have yet to notice a work which, in its embellishments, seems to be inferior to none of the others, the illustrated edition of the *Letters of Abélard and Heloise*. This subject is far

more popular in France than in England; the book seems to have found so little favour in the eyes of the London booksellers, that we only know it ourselves by some splendid specimens of the cuts which adorn it, given in a fine French periodical entitled "L'Artiste," illustrative of a very interesting article on the book by a clever writer, G. Laviron. These specimens are certainly exquisite.

#### MISCELLANEOUS.

*Glimpses of the Old World; or, Excursions on the Continent and in Great Britain.* By the Rev. J. A. Clark, Rector of St. Andrew's Church, Philadelphia, United States. 2 vols. London, 1840. Bagster and Sons. This work must possess very considerable interest for the religious classes of the community, being the record of an extensive tour through Italy, France, England, &c., by an

American clergyman, whose health required a relaxation from his clerical duties; of the highly evangelical school, he describes the impressions made upon his mind by the state of religion and conditions of the people throughout the course of his travel, and gives his opinions frankly and considerably on what he witnessed and heard in connexion with these important subjects. His English visit will most attract English readers, and though

we cannot enter upon the thousand topics brought forward and discussed, we may inform them that his enthusiastic feelings on approaching our shores are gratifying examples of the right American tone (of the child towards the parent), and that his accounts of our pulpits, Exeter Hall meetings, &c. &c., not forgetting a trip to Epsom races, into which he was accidentally betrayed, may be perused with benefit by the public, and especially by its more serious portions.

*Fitzwiggins. A Novel.* By the Author of "Sydenham," &c. 3 vols. 12mo. London, 1840. Bentley.

THE adventures of a little farmer's son, who opens life as a shop-boy, runs through the gradations of many menial services, and finally settles in a small way of business with a wife. There is no interest in the hero; and all that can be said for the publication is that it sketches in an ironical and quizzical manner the characters of many persons, and the circumstances of many situations in life. The proceedings of the Association of Servants is, perhaps, the best piece of jocularity in the work.

*Diary of a Nun.* 2 vols. 12mo. London, 1840. Colburn.

PART journal of a tour through Italy, and part novel, and possessing but slight claims to popularity in either character. It is interlarded with Italian quotations and sentences.

*The Bank of England, and other Banks.* Pp. 16. (London, Whittaker and Co.)—A panegyric upon the Bank, setting it above all other institutions.

*A Refutation to Cobbett's Doctrine of Paper Money being Incompatible with the Coexistence of Gold,* by T. Dahmann. Pp. 24.—Another pamphlet, producing a scheme of the writer's which we do not very clearly understand. It rests on particular issues of government bills or bonds, instead of bank-notes, to meet the circulation.

*The Temperance Emigrants, a Drama, &c.* by J. Dunlop, Esq. Pp. 91. (London, Houlston and Stoneman.)—The author of the "Philosophy of Drinking Usages," &c. is a persevering advocate for temperance societies, in whose cause he has constructed this drama, which has only the merit of its purpose and no dramatic merit to recommend it.

*The Protestant Exiles of Tillythal, &c.* from the German, by J. B. Saunders. Pp. 125. (London, Hatchard and Son.)—The story of these Protestant exiles from the Tyrol and their persecutions resemble, on a small scale, the more ancient and extended affairs with which the public are so well acquainted through the works of Gilly, and others. The writer avers that they prove the spirit of the Romish Church, where it can domineer over Protestantism, to be unchanged. The narrative possesses German simplicity, and is interesting.

*The Closet Companion,* by the Rev. J. Boulby. Pp. 203. (London, Whittaker.) *The Ball I live on; or, Sketches of the Earth.* Pp. 104. (London, Green.)—Two nice little books for youth, the former of religious instruction, like Gisborne's "Every Day in the Year;" and the latter pleasantly explaining points of natural history on the ball of earth which we inhabit.

We must dismiss a few books from our table with very brief notices. *An Essay on the Oxford Tracts* (pp. 126. London, Cadell; Edinburgh, Blackwood) asserts the authority of the Church of England, and condemns the new Oxford sect for endeavouring to establish a mid-way between the Reformed and Romish Church. *Des idées Napoléoniennes,* by Prince Napoleon Louis Buonaparte. 8vo. pp. 175. (London, Colburn.)—A biographical notice of the author, and a treatise on governments in general, and the government of the late emperor in particular, whose wars are compared to the overflows of the Nile, apparently destructive, but in reality the sources of fertility and abundance. *Papery in England,* by the Rev. C. Stovel. Pp. 135. (London, Ward and Co.)—The substance of five lectures delivered in Little Prescott Street meeting-house, and strongly anti-papal. *Dr. Broache's Homoeopathic Documents* (pp. 152, London, Hurst) upholds the modern and reformed system of homoeopathic practice, and laughs to scorn the old methods and the pretences of Hahnemann. "*Contraria contrariis curentur, similia similibus curentur.*" There is much ability in the discussion. On the subject of homoeopathy we may also mention *Annals of the Dispensary.* (8vo. pp. 28.) Dr. Curie's lecture, and all information respecting this Institution.

#### ARTS AND SCIENCES.

ROYAL GEOGRAPHICAL SOCIETY.  
[Proceedings of January 13th, concluded.]

1.—'JOURNAL of a Voyage from Port Essington to Timor Laut, the Arrú, and Ki Islands,

in H. M. S. Britomart, Captain Owen Stanley, and Lieutenant A. L. Kuper, in March 1839." Communicated by Captain Beaufort, R.N. "Sailing from Victoria on the 21st March, we anchored off Olliet, a populous village on the south-eastern part of Timor Laut, in lat.  $7^{\circ} 55' S.$ ,  $131^{\circ} 26' E.$  (measured from Port Essington, assumed to be in  $132^{\circ} 16' 15' E.$ ), on an abrupt cliff, 413 feet above the sea. The natives were friendly, and came on board in large numbers. They are generally good-looking, athletic men. A few leaves of a navigation book and other articles, which had belonged to some of the men of the Charles Eaton, when wrecked in Torres Straits, were found with them. Population about 1000. Running along the eastern side of Timor Laut, we passed Ladrá, and some other villages, similarly situated as Olliet. The whole coast is very beautiful, the land moderately high and thickly wooded: a coral reef extends along the shore at about one mile distance. The Arrú Islands are low and flat in appearance. On the 25th, we anchored off the small village of Dobbo, in the Island of Wamma, on a sandy point, in lat.  $5^{\circ} 45' 45'' S.$ , long.  $134^{\circ} 20' E.$ , Var.  $3^{\circ} 30' E.$ , Dip,  $25^{\circ} 39'$ . These islands are chiefly a mangrove swamp, intersected by numerous channels, thickly wooded with fine trees, some of which rise upwards of seventy feet before they throw off their branches: the wood of a reddish colour and close grain; the foliage variegated and beautiful, and covered with creepers, which climb to the top of the highest trees. The village is inhabited by Bughis and Chinese, but we saw nothing of the natives, who rarely come to the coast. No supplies could be obtained. Trade consists in birds of paradise, birds'-nests, pearls, and trepang.

"April 3.—Hove too off the straggling village of Elli, at the north-eastern extremity of the Great Ki Island: the prahus and boats used in the trade in these seas are chiefly built here. This, the largest of the Ki group, is a long narrow strip of land, extending in a N.N.E. and S.S.W. direction, forty-five miles in length, with an average breadth of four miles; it is mountainous, and thickly covered with fine forest trees: about the centre the land reaches 3310 feet above the sea, which is the highest point; the north and south extremes of the island are in  $5^{\circ} 16' S.$ ,  $133^{\circ} 16' E.$ , and  $5^{\circ} 58' S.$ ,  $133^{\circ} E.$ , respectively. We ran down the eastern side of the island, and, rounding the southern point, sailed to the northward, between the Greater and Lesser Ki: this latter presents a great contrast to the former, being very low-wooded land, but both shores appeared to be thickly inhabited.

"April 6.—Anchored off the walled village of Kí Dula in a bay at the north-western extremity of the island; this is also a great boat-building station; the country around quite a garden, but the natives indifferent as to selling the produce, so that we could obtain no supplies; the bay is fronted by several small islands, and thus affords an excellent harbour in either monsoon; this island extends twenty-three miles from north to south, with an average breadth of eight miles. On the 7th, steered to the southward, passing numerous small islands, which lie a few miles off the Lesser Kí, all along its western side; and on the 9th, anchored off the village of Aweer, on the south-west side of Vordate, a small island of the Tenimber group, about six miles long from north-east to south-west, by two miles wide; it is moderately high and well cultivated; its north point lies  $6^{\circ} 54' S.$   $132^{\circ} 5' E.$

On the 11th, we revisited Timor Laut; and on the 15th April, again anchored at Port Essington." This journal is accompanied by a tract-chart and plans of Olliet, Dobbo, Dilli in Timor, and Lizard Island, and an inlet near Double Point, in Torres Straits; besides views of Dilli, Port Essington, and Victoria, &c., by Captain Owen Stanley and Messrs. Drury and Hill, of H. M. S. Britomart.—2. 'Narrative of an Excursion in Coburg Peninsula, Australia, in May, 1839,' by Lieutenant P. B. Stewart, of H. M. S. Alligator. In the course of this journey, of about eighty miles in circuit, the party found some very fine grazing country, sixteen streams or chains of pools, some good straight and light timber, a sort of cedar carrying a girth of three yards to the height of thirty feet; the cabbage palm (an excellent vegetable) growing in abundance over an extent of fourteen miles; many buffaloes (escaped, probably, from the former and latter settlement), and a few kangaroos: the natives met with were all friendly.—'A Summary of the Discoveries made and Objects obtained during an Expedition on the Western Shores of Australia, in the Months of February, March, and April, 1839,' by Captain George Grey, Communicated by Lord John Russell.—"The district examined during this expedition, lies between Cape Cuvier and Swan River, having for its northern limit the parallel of  $24^{\circ}$  south latitude, and for its southern limit the parallel of  $32^{\circ}$  south latitude. This expedition combined two objects, the examination and nautical survey of such parts of the coast lying between these limits as were imperfectly known, and the exploration of such parts of the continent as might on examination appear worthy of particular notice. The materials for the construction of a chart of that portion of the coast, which has been only too imperfectly delineated by Van Keulen, were first collected; a survey of the unknown parts of Shark's Bay was then completed. In addition to these, I have also the materials requisite to construct a map of the country lying between the limits above named, sometimes extending to the distance of forty miles from the coast. The rivers which are, when considered with reference to the other rivers of Western Australia, of considerable importance, some of them being larger than any other yet found in the south-west of this continent, have been discovered, besides many smaller streams. These rivers I have named the Gascoigne, the Dule Ion (or difficult mouth), the Hutt, the Irwin, the Murchison, the Arrowsmith, the Smith, the Greenough, the Garbanas, the Beloe, New Mass (or diminutive river). Two mountain ranges have been discovered; one first seen at the northern extremity of the Darling range, and about thirty miles to the eastward of it, lofty and altogether differing in character from the Darling range, which at this point is called Moresby's Flat-topped Range: its direction is nearly north and south. I have taken the liberty of calling this range after her most gracious majesty, the Victoria Range; and the extensive district of fertile country, extending from the base of this range to the sea, and having a length of more than fifty miles in a north and south direction, I have also named the province of Victoria. The other range is thrown off in a westerly direction from the Darling Range, it is about forty miles in length from north to south, of a bare, sterile, and barren nature, and terminating seaward in Mount Peron, and Mount Le Sueur. To this range I have given the name of Gairdner's Range, it forms a very important feature in

the geography of this part of Australia. Three extensive districts of good country have been discovered in the course of this expedition. The Province of Victoria before alluded to, the District of Babbage, and that of Gabby-boola, or water abundant. The province of Victoria is situated between the parallel of  $28^{\circ}$  and  $29^{\circ}$  south latitude, its most considerable river is the Hutt, which discombogues into a large estuary; a few miles below the estuary the river separates into two branches, both of which were running strong at the time we passed them. Previous to our reaching the Hutt, our boats had all been wrecked; I had, therefore, no opportunity of examining whether the estuary of this river was navigable or the contrary: from its size, however, I consider that it must be navigable. The other principal streams which drain this district are the Irwin and the Murchison. One remarkable feature in the province of Victoria is that the carboniferous series is here developed. Throughout a tract of country in Western Australia, extending in latitude from the bottom of Geographic Bay to Cape Cuvier, and which I have carefully examined, the point above alluded to is the only one in which I have yet found the rocks belonging to this series. This circumstance, therefore, imparts a very high degree of interest to this district. The district of Babbage is situated on and near the river Gascoigne, in Shark's Bay; this river discharges itself into the bay through two mouths, between which lies Babbage Island: the most southern of these mouths is situated in  $24^{\circ} 57'$  south latitude. This river is the most southern river that I have ascertained to be deficient in that universal characteristic of the rivers in the south-west of this continent,—a bar estuary. I have not seen the mouths of three or four of the rivers before enumerated, and I cannot, therefore, say that they discharge themselves into estuaries, but at the same time I cannot say that they may not do so; whereas the Gascoigne has no estuary, at least in the sense that estuary is used in this country, but two mouths of considerable magnitude: this river is also the most northern river on the western side of this continent, where the rise and fall of tide is sufficiently great to exercise any influence upon it relatively to the purposes of navigation. The rise and fall of tide here is about five and a half feet, but there is only one regular tide in twenty-four hours; the first tide rises to a certain point, and ere it has scarcely commenced to ebb, the second tide comes slowly on, so that to a careless observer only one tide is perceptible. The district of Gabby-boola lies immediately to the north of Perth. The largest river in this district is the Garbanass; it, however, contains four other rivers, the Moore River, the Beloe-New-Mass, the Smith, and the Greenough. Moore River, about fifty miles to the north of Perth, was before known. A few miles to the north of this river lies the Beloe-New-Mass, and about twenty-five miles to the north of Moore River is the Garbanass; into this Moore River discharges itself about nine miles from the sea. The Greenough is situated between this point and Gairdner's Range, and immediately under this range lies the Smith, which is a large river even at the distance of thirty miles from the sea-coast. Gairdner's Range is naturally the northern limit of this district, which is connected with Perth by a chain of fresh-water lakes; the greatest distance between any two of which is not more than from four to six miles. The whole of this district is, therefore, immediately available, and affords a gratifying proof that this flourishing colony

is by no means deficient in good and immediately available land. The circumstance also of this district being so abundantly supplied with water, even at the end of an uncommonly dry season, which is the period I traversed it in, much enhances its value. There was one other district examined by us, which possesses such peculiar characteristics that even in this short report I am induced to call your lordship's attention to it. I have named this the district of Koo-him-buit, that is, the district of Falsehood or Deceit; it is situated between a point lying about ten miles to the north of the northern mouth of the Gascoigne and Cape Cuvier: the whole extent of its sea-coast is bounded by a range of lofty sandy dunes, having a width inland of not more than from two to two and a half miles. The first time that I ascended this range was on the morning of the 8th of March, 1839, at a point about fifteen miles south of Cape Cuvier. On looking to the eastward, I was surprised to see an apparently boundless expanse of water in that direction. I hurried back to the boats, and selected three men to accompany me in my first examination of the shores of this inland sea. When we gained the top of the sandhills, the surprise of the party was as great as my own, and they begged me to allow them to return, and endeavour by the united efforts of the party to carry one of the whale boats over the range, and at once launch it on this body of water. I, however, deemed it more prudent in the first instance to select the best route along which to move the whale boat, as well as to choose a spot which afforded facilities for launching it. In pursuance of this determination, we descended the eastern side of the sandhills, which abruptly fell in that direction, with a slope certainly not much exceeding an angle of 45°. I now found that the water did not approach so near to the foot of the hills as I had at first imagined, but that immediately at the foot of these hills lay extensive plains of mud and sand, at times evidently flooded by the sea, for on them lay dead shells of many kinds and sizes, as well as large travelled blocks of coral. The water now appeared to be about a mile distant; it was apparently boundless in an easterly and north-easterly direction, and was studded with islands. We still felt convinced that it was water we saw, for the shadows of the low hills near it could be distinctly traced on its unruffled surface. As we continued to advance, the water, however, constantly retreated before us, and at last surrounded us. We had been deceived by mirage! The islands are really so when the plains are covered with water; in many places the sandy mud was still so moist that we sunk deeply into it, and, after travelling for fifteen miles on a north-eastern course, I could still see no limits to these plains in a north-east direction; nor could I either then, or on any subsequent occasion, find the channel which connected them with the sea. We dug in several places in these flats and in their vicinity, but could only find salt water, whereas in the narrow range of sandhills separating them from the sea, we found abundance of fresh water only four feet below the surface of the valleys between these hills. As this range of hills offers many geological phenomena, I have named it Lyell's Range, in compliment to the distinguished geologist of that name. In the course of this expedition I have been able to fix the limiting parallels of latitude which various plants and animals inhabit on the western coast, and find that the natives inhabiting the banks of the Gascoigne speak a language iden-

tical with that of the natives of Swan River and King George's Sound. The dialect is slightly different, but the language is the same. I had at this point a friendly interview with them, and both myself and the natives who accompanied me were soon able to converse fluently with them. It thus appears that for a distance of 650 miles, measured in a straight line along the western coast, a common language prevails. The exact opposite to this has hitherto been supposed to be the case. The attention I have fortunately been able to pay to that part of your lordship's instructions, in which you so particularly direct me to endeavour to learn the language in use among the natives, has been the means of enabling me not only to acquire the information I have above detailed, but has placed at my disposal a fund of information relative to the laws, customs, and habits of thought of these people, which I should by no other means have been able to obtain." Major Kretschmar, late of the Brazilian Topographical Brigade, who was present at the meeting, exhibited and explained a panorama of the towns of Monte Video and Buenos Ayres, drawn and coloured on the spot by himself in 1837.

#### STATISTICAL SOCIETY.

MR. HALLAM in the chair.—A paper 'On the general Statistics of the Parish of St. George the Martyr, Southwark,' by the Rev. George Weight, was read. This communication is highly creditable to the reverend author's industry and research. We cannot enter upon all his details; but as a large section of the parish—"The Mint"—is now enjoying some degree of public attention in London, in consequence of having been the scene of "the life, character, and behaviour, of the notorious Jack Sheppard," a word or two in reference to that place may be considered interesting. Jack Sheppard's companion, the well-known Jonathan Wild, whose residence was next to the Cooper's Arms, in the Old Bailey, kept his horses at the Duke's Head, still standing in Red Cross Street, within the precincts of the Mint. It is one mile and 216 yards in circumference. In 1697 it contained 92 houses; and in 1830, 1712. Opposite to St. George's Church was formerly Suffolk House, a mansion belonging to Charles Brandon, duke of Suffolk, the husband of Mary, sister of Henry the Eighth of England, and widow of Louis the Twelfth of France. The duke died in 1545, and the palace then fell into the hands of the king, who converted it into a royal Mint. It was then called Southwark Place, and sometimes Duke's Place. Some suppose that Henry the Eighth obtained possession of the palace in consequence of an exchange between himself and the Duke of Suffolk in 1537; others think that the king purchased it. Edward the Sixth, in 1549, came from Hampton Court to visit the Mint; it was then spoken of as "the capital messuage, gardens, and park in Southwark, and the gardens, lands, &c. to the said mansion-house, gardens, and park belonging." Queen Mary gave the Mint to Nicholas, archbishop of York, and his successors for ever, to recompense for York House, Westminster, which had been taken from Cardinal Wolsey by Henry the Eighth. The archbishop seems not to have approved of this family residence "for his inn and lodging when he repaired to London;" and therefore, in 1557, he sold it, when the Mint was pulled down, and a great number of mean dwellings was erected on its site. The locality of the Mint became an *Alsatia*, out-herding the famous one in White Friars, of

which Sir Walter Scott, in his "Fortunes of Nigel," has given such a graphic description. It was an asylum for debtors, coiners, and vagabonds of all orders and degrees. In the time of Edward the Sixth we read of the "traitors, felons, fugitives, outlaws, condemned persons, convict persons," and so forth, herding in St. George's and the neighbouring parishes. It became at length such a pest that statutes in the 8th and 9th years of William the Third, and 9th and 11th of George the First, ordered the abolition of its privileges! The evil, however, to quote the elegant proverb, was too deeply "bred in the bone" to be so easily "got out of the flesh;" some parts of the Mint are still exceedingly filthy and wretched, and inhabited by a poor and profligate population. The details touching births, deaths, marriages, schools, educated and uneducated, &c., we necessarily pass over.—Mr. Rowland Hill was at the meeting, and made some observations on the uniform penny postage system. There was nothing very new elicited: we understood him to say that the letters delivered through the General Post-office in London on the 11th of January, the day after the new system was adopted, amounted to about 80,000; the corresponding day of last year they were 30,000; on the 12th of January, this year, 100,000; on the 13th, 80,000; and they now average 70,000 per day.—M. Dupretaux, of Brussels; Villermé, Paris; Meidinger, Frankfurt; Mallet, Paris; and Signor Gioja, Florence, were elected foreign honorary members.

#### MEDICO-BOTANICAL SOCIETY.

At the Anniversary Meeting of the above Society, held on the 6th of January, Humphrey Gibbs, Esq. in the chair, the following gentlemen were elected as officers for the ensuing year:—*President*, Earl Stanhope. *Treasurer*, Henry Cope, Esq. jun. *Secretaries*, William Henry Judd, Esq., Edwin Saunders, Esq. *Librarian*, James Yearsley, Esq. *Conservator*, Frederick John Farre, M.D. *Professor of Botany*, Charles Johnson, Esq. *Professor of Chemistry*, Thomas Everitt, Esq. *Professor of Materia Medica*, George G. Sigmond, M.D. *Professor of Toxicology*, William Tiffin Iliff, Esq.

#### BOTANICAL SOCIETY.

FRIDAY, 17th January.—Mr. J. E. Gray, *President*, in the chair. Read, the conclusion of the 'Notice of the Indigenous Plants on the Banks of the River Wye,' by Mr. Edwin Lees. The excursions, during which the numerous varieties named in the paper were collected, were made chiefly in the summer of 1839, along the whole course of the beautiful winding Wye, from Plinlimmon to Severn. The habitats of the plants in the several districts, meadowland, moorland, rock and forest, and littoral, were described with every requisite information for their classification. The varieties were, moreover, arranged botanically in a catalogue attached to the paper, which, to the student of that science, about to ramble through the same lovely country, will be a useful companion. Mr. Lees speaks of the varying and picturesque scenery with the enthusiasm so natural to the Wye tourist, which for him not to feel, is to know himself dead to the kindlier and ennobling impulses of human nature. We would not be that man!

#### LITERARY AND LEARNED.

##### UNIVERSITY INTELLIGENCE.

OXFORD, Jan. 14.—Being the first day of Hilary Term, the following degrees were conferred:—

*Doctor in Music.*—W. Marshall, Organist of Christ Church and St. John's College.

*Masters of Arts.*—Rev. R. Shepherd, St. Mary Hall; Rev. J. Hunt, Queen's College; Rev. M. D. French, Brasenose College; Rev. T. C. H. Leaver, Rev. S. H. Russell, Rev. J. A. Hessey, Fellows of St. John's College.

*Bachelors of Arts.*—T. Helmore, Magdalen Hall; J. H. Scott, Christ Church.

#### ROYAL SOCIETY.

SIR JOHN BARROW in the chair.—A paper on the Structure of Adventitious Bone, by Mr. Smee, was read. Little of this communication can be reported. The author, in the course of his researches, found that earthy matter pervaded every portion of adventitious bone. This consists of three kinds,—reproduced bone, regrowth, and ossification.—Another paper was read, entitled 'An Attempt to Establish a New System of Notation for Life Contingencies,' by Mr. Harvey.

#### ROYAL ASIATIC SOCIETY.

JANUARY 4th. Professor Wilson in the chair.—The Secretary read a series of letters from Major Rawlinson, severally dated from Persia, between July 1838 and August 1839, giving an interesting account of his labours and persevering exertions in deciphering and translating the cuneiform inscriptions at Bisitoun. The result of his researches promises to be of the greatest value, in presenting, from the most authentic sources, a history of the Persian empire, from the time of Cambyzes to the latter end of the reign of Darius; corroborative, in a most satisfactory degree, of the genealogies according to Herodotus, although varying considerably in the narrative. Major Rawlinson details the gradual progress of his discoveries, and the modifications which his first view of the subject had experienced, as he improved his acquaintance with the character and language of the inscriptions. He also alludes to the obstacles continually in his way, arising from the very unsettled state of Persia; and to the serious difficulty of copying many of the inscriptions, occasioned by their elevated position, which makes an approach to them, in most cases, dangerous, and in some, absolutely impossible, without the erection of expensive scaffolding, for which he had neither time nor means. These difficulties were described by Sir Robert Ker Porter, who, with all his efforts, was unable to approach near enough to read the inscriptions, even with a glass. He says, "at no time can it be attempted without great personal risk;" and observed, that even had he been able to draw himself high enough to read them, the transcription would have occupied him more than a month. Major Rawlinson speaks also of the difficulty of understanding the language, which he considers much more allied to the most ancient form of Sanskrit, that of the Veda dialect, than to the language of the Zend Avesta, which, with the religious system contained in it, he brings down to the epoch of the commencement of the Sassanian dynasty. Each column of the inscription comprises ninety-six lines; the first contains the titles and genealogy of Darius, whom it traces through Veshasp, Arsham, Ariyaremen, Taishpaish, and Hekhamenish; the Hystaspes, Arsames, Ariaramnes, Teispes, and Achæmenes, of Herodotus. It then enumerates the kingdoms subject to Darius, including above twenty provinces, which extended from Ionia, on the west, to the Mekri, the people of the modern Mekran, on the east. The manner in which Darius became possessor of the throne is given with considerable detail; and it affords an interesting subject of comparison with the tales of the Greek and

Roman writers on the same subject. Cambyzes, of the race of Amakhem, had a brother named Berjeze, the Mergis of Justin, and Smerdis of Herodotus, whom he slew in battle. On his departure for the conquest of Egypt, the empire was disturbed; and a Magian, named Gumat, declared himself to be the deceased Smerdis, son of Cyrus, and in his name took possession of the empire in the absence of Cambyzes, who died in Egypt about this time. Gumat, after this, attacked the Susians, over whom the deceased Smerdis had formerly been governor. The Susians soon discovered that he was an impostor, and they resisted him in consequence. Soon after he was recognised by Darius, as Gumat the Magian, and was attacked by him, with the aid of a body of archers, and put to death. Darius upon this took possession of the throne. The acts of Darius in his new kingdom are then detailed; among which is particularised his restoring the worship of fire, and re-establishing the fire-altars, which had been desecrated by the Magians. The revolt of Susiana under Atin, the Otanes of the Greeks, is then related. The inscription goes on to detail the revolt of Babylonia, under Nejetebir, who pretended to be Nebuchadnezzar (the Nebuchadrezzar of the Bible: see Jeremiah, xxi. et seq.), and was defeated and made prisoner by Darius. The rebellion is given in detail, and continued to the end of the first column, and as much of the second as Major Rawlinson copied. The remainder being a good deal broken, he left it to proceed to the third, which is the most entire of the whole, intending to return to the second column at some future opportunity. The third column continues and concludes an account of the subjugation of Parthia, begun, without doubt, in the second column. Then follows an account of the conquest of Margush (Merv), which is called the eighth conquest of Darius. Next is a long account of the revolt of the province of Persis, which is not concluded so far as Major Rawlinson has copied this column, that is to say, to the sixty-fifth line; there remain, therefore, thirty-one lines. The fourth column Major Rawlinson fears is wholly illegible, so much of it being obliterated as to leave only detached words. There are three other columns in the Median character, whose position is so difficult that it has baffled all his attempts at reading them; also, five in the Babylonian character, much defaced; these, doubtless, contain translations of the history now touched upon. There are also several sculptured figures, which are engraved in Sir Robert K. Porter's "Travels," the inscriptions on which Sir Robert was unable to approach. Four of these Major Rawlinson copied with great difficulty and danger, being compelled to stand on the topmost step of a ladder, with a precipice of nearly 400 feet below him. The prostrate figure (see Sir R. K. Porter) is that of Gumat, the Magian. The next is that of Atin, the usurping monarch of Susa. The inscription on the third statue was not copied, but that on the fourth shews the figure to be Fredvertish, or Phraortes. The fifth statue is the representation of Chitretakim, who made himself king of the revolted Sogartii. Further than this Major Rawlinson was unable to go; but he promises himself another visit to the rocks, when he will be better prepared with means to overcome the difficulties he will have to encounter. At the conclusion of this remarkable paper, the director observed that it was useless to speculate upon these discoveries until the copies themselves should be brought home; but, from what had been communicated,

it was evident that the efforts of Major Rawlinson had been eminently successful. The labours of Grotefend, Burnouf, Lassen, and all others who had preceded, had been confined to inscriptions of a few lines only; but the extensive details now found were wholly unparalleled. How far they might be depended upon might be seen hereafter; but he thought there was no reason to doubt their general accuracy. Nothing could be more unpretending than the manner in which this important discovery was announced; and we might venture to look forward with extreme interest, and the best hopes, to the communication of one of the most valuable contributions to ancient Oriental history ever made.

#### SOCIETY OF ANTIQUARIES.

MR. HALLAM in the chair.—Mr. Worship communicated two original letters from Queen Elizabeth to Dr. Dale, the English ambassador in France, relative to her proposed marriage with the Duc d'Alençon, who was anxious for an interview; which, however, the queen declined, as well as the proposal of marriage. Mr. Goodwin, jun. communicated some notices on the ecclesiastical buildings of Normandy; part of which being read, the remainder was postponed: and the Meetings were adjourned to 6th February, next Thursday being the anniversary of Charles's martyrdom.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday.*—Geographical, 9 P.M.; Entomological (Anniversary), 8 P.M.; Medical, 8 P.M.  
*Tuesday.*—Medical and Chirurgical, 8½ P.M.; Zoological, 8½ P.M.; Architectural, 8 P.M.  
*Wednesday.*—Society of Arts, 7½ P.M.  
*Thursday.*—Royal, 8½ P.M.; Antiquaries, 8 P.M.; Numismatic, 7 P.M.; Western Literary, 8½ P.M.  
*Friday.*—Royal Institution, 8½ P.M.  
*Saturday.*—Mathematical, 8 P.M.; Westminster Medical, 8 P.M.

#### FINE ARTS.

##### PRINCE ALBERT OF SAXE-COBURG AND GOTHA.

IN our last publication we noticed a miniature of Prince Albert, executed during his Serene Highness's recent visit to this country, by Mr. W. C. Ross, A.R.A.; we have now to mention a portrait of the same illustrious person, of which Messrs. Hodgson and Graves have favoured us with a private view, painted within the last month by Mr. G. Patten, A.R.A., at the palace of Gotha, whither Mr. Patten went for the purpose. It is a half-length, and is in military costume. Of this production, we can justly say that the composition is simple and good, and the expression firm and unaffected; and that we have no doubt that Mr. Lupton, in whose skilful hands it is about to be placed, will produce from it an attractive and popular print.

#### NEW PUBLICATIONS.

*Panoramic Sketch of Athens.* By Mrs. Bracbridge. Taken May 1839. Dalton.

SOLD in aid of the funds of the London Benevolent Repository (as similar productions from the same artist-like hand and feeling heart have been for other charitable institutions), this striking *Panoramic Sketch* of the "antique city of Theseus," though claimed by its reviver Hadrian on his Gate, is eminently deserving of public favour. The view is taken from an eminence between the Pnyx and the western face of the Acropolis, and embraces every prominent and interesting feature of Athens. A short introduction specifies what they are, and gives us many classical and historical recollec-

tions connected with them. But unless we could spread out the picture, about 120 inches in length, and nine in breadth, we could furnish no idea of the spirit and effect with which it is executed. All we can do is to recommend it strongly, both for its intrinsic merits and attractions, and for the excellent object to which its liberal produce is devoted. The mountains, crowned with ancient ruins, the monuments of Greece, and the surrounding country, are exceedingly picturesque; and the whole, indeed, very beautiful.

*Admiral Lord Viscount Nelson, K.B.* Painted by J. Hoppner, R.A.; Engraved by W. O. Burgess. Welch and Gwynne.

WE doubt whether in the whole course of his long professional life Mr. Hoppner ever painted a more characteristic portrait than that of our illustrious naval hero, which is now in her majesty's collection, and from which Mr. Burgess has executed this faithful and forcible mezzotinto print.

*The Death of Harold at the Battle of Hastings.* Painted by A. Cooper, R.A.; Engraved by W. Bromley. M'Lean.

WHEN we gaze on such subjects, it is impossible not to ask ourselves when human beings will become wise enough no longer to furnish them! Mr. Cooper has here represented, with his usual ability, a variety of the ways in which men inflict death and torture upon another; but we cannot say that the scene is one which it is pleasing to contemplate. Mr. Bromley has engraved the plate with combined spirit and softness.

#### THE DRAMA.

*Drury Lane.*—On Wednesday, Mr. Haynes's historical tragedy, *Mary Stuart*, was produced here, to a house crowded in every part. Sad events in the life of this beautiful Unfortunate have often furnished subjects for the drama; but we are not aware of any composition in which the one sanguinary act—the assassination of David Rizzio—has been consecrated to the Tragic Muse. We could hardly have believed it susceptible of sustaining the action of a play of five acts—it is in itself so simple and single; but the author, with the aid of poetry and contemporaneous incident, has wrought out his design with very considerable art and effect. All the scenes in which *Ruthven* (*Scottie*, pronounced *Riven*) appears are to the purpose, and carry on the plot, evidently indicated in the opening scene, to its bloody conclusion. The other portions are, we might say, in a great degree rather accessory than direct; and yet we do not see how they could be dispensed with. The creation of a daughter of *Ruthven* links that fierce man more congenially with human feelings; and her death, though abruptly brought on, is by far the most touching and pathetic circumstance in the tragedy. In our opinion it is only injured by the most impressive description of a dream, by her bereaved father, almost over the corpse of his lost child; which, however fine in itself, is out of time and place where the strongest natural passions must overbear all ornament of speech and figures of imagination. Parents do not think of lilies by the death-bed of their loved offspring, nor does their real grief allow them to draw terrific images of the grim Tyrant, who has robbed them of their dearest treasure. This splendid passage before, instead of after, the death of *Katherine*, would be all that could be wished. We would advise its transposition. Speaking, however, of these two characters, we must con-

fess that the most dubious portion of the whole play is, first, the mission of his innocent daughter to be a spy on *Mary's* actions at court; and, secondly, his bringing her to the king to confirm his wavering resolution, by telling the tale of *Mary's* giving *Rizzio* her miniature, as his guerdon, for acting her troubadour in a blameless revel among her ladies and attendants. There is a baseness in this which it is difficult to get over, though Mr. Haynes displays great skill in rendering it as little revolting as possible, and also visits the crime with the deepest severity of poetic justice. The view he has taken of *Mary's* character exposes her to the charge of indiscretion equivalent to moral guiltiness; and she is more arrogant and arbitrary than we like to consider her through the lights of history. Perhaps *Mrs. Warner's* style, which is more forcible than tender, might add to this effect; and we make the remark, not as objecting to the talents displayed by that lady, but abstractedly to the part not being one of the best fitted for their exercise. A sublime *Lady Macbeth* might be a very indifferent *Cordelia*. *Darnley's* portraiture is ably done, and the scene in which it is most exhibited, where he signs the sanction of *Rizzio's* murder at the bidding of *Ruthven*, is an exceedingly good one. *Rizzio* himself is raised somewhat in importance, and, we think, judiciously so; for it is improbable that a confederacy of nobles, with the king in their confidence, would have been formed to do to the death a minion no higher than a captivating musician, who could stand little in the way of their intrigues and ambition. The rest of the *dramatis personæ* are as historically represented. With regard to the language, it is not easy to deliver a judgment from merely hearing it recited on the stage; but it appeared to us that there were many fine original thoughts expressed in nervous and beautiful poetry. A few lines which the audience chose to apply politically to present affairs ought to be omitted, as they are not essential to the piece, and can only tend to uproar and confusion. The most notorious occurred where *Ruthven*, speaking of *Rizzio*, says—

"I hate aliens,  
As all our noble forefathers have done;"

which led to a tumult of applause and hisses.

We have now only to state that the performance of Macready in *Ruthven* was masterly from first to last. He is roused from his couch of sickness by the inflamed desire to terminate what he deems the disgrace of his country; his feebleness rises into energy; his lofty contempt of *Rizzio* and *Bothwell*, and nearly as much so of the vacillating *Darnley*, is artfully contrasted with his affection for his daughter, which also relieves his general sternness, and his appalling apparition in armour at the last, the consummation of his vengeance, and his death, are all among the most striking, we might say sublime spectacles, ever witnessed or heard on the stage. In one scene alone do we fancy the impersonation of this character may be improved. We allude to that where in full court he taunts *Bothwell* and *Rizzio*, and, in shewing his supreme dislike to them, turns his back upon the queen, and seems to communicate with his fellow-conspirators. *Ruthven*, though rude and angry, ought not to affront his sovereign by this contemptuous conduct; but, after all, the error is merely one of stage grouping, but the acting is altogether so perfect, that we cannot help noticing even this trifle.

Mr. Phelps, in *Darnley*, is rather too locomotive; yet capriciousness and weakness do run

into such uneasy gestures, and with a little softening the part will be sufficiently well played. Of Elton's *Rizzio* we have to declare our approval throughout, with the exception of the cringing attitude with which he clings to the queen's garments at the end of his career. He declaimed the words with much force and discrimination, and nowhere caused a regret that the character had been assigned to him. Mr. G. Bennett as *Morton*, and Mr. Howe as *George Douglas*, deserve our praise; and the other less prominent male personages were fairly supported by Yarnold, Roberts, Waldron, and others. Of the *Mary* of Mrs. Warner we have already spoken; and we have only to add that *Edy Argyle* was very respectably performed by Mrs. W. West; and the *Lady Katherine* very sweetly and naturally by Miss E. Montague,—the Juliet *débütante* a week or two ago. The music between the acts, under the direction of Mr. A. Lee, struck us as being particularly appropriate, and it lost nothing under the able leadership of Mr. Eliason. At the conclusion the most unanimous cheering rewarded the efforts of the author and actors; the former for having produced a noble tragedy, and the latter for having exerted every nerve to do it justice in the representation. As *Macbeth* filled this theatre on Monday, and *Mary Stuart* is likely to fill it for many a night, we end with congratulating the lovers of the drama on their accession to another high and legitimate source for its enjoyment, and the restoration of Drury Lane to its fair rank as a national theatre.

Covent Garden overflows nightly, such is the impulse which has been given to the well-appointed and well-acted drama. *The Clamdestine Marriage*, revived in the same admirable manner as *The School for Scandal*, &c. &c. now presents its attractions one night in the week, and goes off with great éclat.

*The Adelphi* is equally flourishing with *Jack Sheppard* and its laughable pantomime.

*The Musard Concerts.*—The delightful overture to "Prometheus" has been produced this week, and is one of the finest things so finely executed at this theatre.

#### VARIETIES.

M. P. Visconti, French Commissioner of Antiquities at Rome, has addressed a letter to the Académie des Inscriptions et Belles Lettres, giving interesting details of discoveries recently made in that city. It has been found, he states, that the Sacred Island of the Tiber was surrounded by ancient tombs, of which only the basements now remain. They were of two different epochs: the earliest, that of the Antonines; and the most recent, of Alexander Severus. In such of them as the chambers have remained entire, there are still inscriptions fixed in their original places, and several sarcophagi, one of which is in fine preservation, and represents the mythological story of the detection of Achilles in the Island of Scyros. Upon the recommendation of M. Visconti, and under his inspection, the Pope has ordered excavations to be made in the Forum, near the Basilica Giulia. The same letter announces that Prince Odescalchi, brother of the cardinal, has been appointed President of the Roman Academy of Archaeology, in the room of the Marquis de Biondi, deceased.—*French Paper.*

*A Sketch lately taken at Windsor.* (T. M'Lean.)—Very much in the style of H.B., though it does not bear his name. This sketch represents the Queen and Prince Albert on horseback as the principal figures, the elder brother of the prince on the right, and Lord

Melbourne and a lady of the court a little in the rear. Her Majesty's likeness is not flattered, as the teeth are rather too much shewn. She is looking tenderly towards the prince, whose appearance is very gentlemanlike, English, and prepossessing; which, as we learn, is altogether his character.

**Earthquake.**—The entire line of the Pyrenees, from St. Gerons le Bagnieres, felt the shock of an earthquake on the 5th.

**M. Nibi.**—This celebrated and very learned antiquary died at Rome on the last day of the year.

### LITERARY NOVELTIES.

In the Press.

A new monthly Zoological work, to commence with the "Natural History of Quadrupeds, and other Mammiferous Animals," by William Charles Linnaeus Martin, F.L.S. To be illustrated by upwards of 1000 wood engravings from the life, by William Harvey. A Dictionary of Terms: comprising those used in Botany, Chemistry, Comparative Anatomy, Conchology, Entomology, Paleontology, Zoology, and such other branches of Natural History as are connected with the Study of Geology, by William Humble, M.D.

### LIST OF NEW BOOKS.

Icones Plantarum; or, Figures with Description of New and Rare Plants, by Sir W. J. Hooker, Part VI. 1s.—Description of the Greek Papyri in the British Museum, edited by J. Forshall, 4to. 10s.; large paper, 15s.—E. Newman's History of British Ferns, with an Illustration of each Species, 8vo. 10s.—Thomas Middleton's Works, by Alex. Dyce, 5 vols. post 8vo. 2l. 2s.—A Winter in Iceland and Lapland, by the Hon. A. Dillon, 2 vols. post 8vo. 1l. 1s.—Owen, on the Hebrews, new edition, 4 vols. 8vo. 2l. 16s.—Rev. J. Todd's Simple Sketches, 32mo. 2s.—Ditto Truth made Simple, 32mo. 2s.—Ditto Lectures to Children, 32mo. 2s.—A Father's Reasons for Repose, 12mo. 4s. 6d.—Barlow's Tables of Squares, Cubes, &c. new edition, post 8vo. 8s.—Ancient Christianity, by the Author of "Spiritual Despotism," Vol. 1. 8vo. 10s. 6d.—The Steam Engine, by Hugo Reid, 9d edition, 12mo. 4s. 6d.—E. Elliott's Poetical Works, royal 8vo. 4s.—A. Carmichael on the Theology and Metaphysics of Scripture, 2 vols. 8vo. 21s.—Blundell's Obstetrics and Diseases of Women, in 1 vol. 8vo. 21s.—Sermons Preached in Critical Times, by the Rev. E. Thompson, post 8vo. 6s. 6d.—The Saucy Jack and the Indian, by a Blue Jacket, 2 vols. post 8vo. 18s.—East India Register and Directory, 1840, 10s.—Arabian Nights, translated by Lane, Vol. II. royal 8vo. 21s.—W. Turner's Lives of Eminent Unitarians, fcap. 7s. 6d.—J. Guy's Atlas of Modern Geography, 8vo. or 4to. 5s.—The Real and the Ideal; or, Illustrations of Travel, 2 vols. post 8vo. 21s.—Nina Sforza; a Tragedy, by R. Z. S. Troughton, 8vo. 4s. 6d.—The Czar; a Romance of History, 3 vols. post 8vo. 11s. 6d.—Hand-Book of Chemistry, by G. G. H. Caunter, 12mo. 6s.—Confessions of Harry Lorrequer, 8vo. 12s.—G. Soane's Life of the Duke of Wellington, Vol. II. fcap. 5s.—The Life of Christ, with Twelve Engravings, square, 3s. 6d.—Blundell's Obstetrics, by Lee and Rogers, 8vo. 24s.—Green's Useful Knowledge for Little Children, fcap. 1s. 6d.—The People's Letter-Box, and Penny Postage Companion, 16mo. 1s.—Savory's Companion to the Medicine Chest, 24 edition, 12mo. 5s.—Publisher's Circular; London Catalogue of Books for 1839, royal 8vo. 1s. 6d.—Dr. J. G. Millingen on the Treatment of the Insane, 18mo. 4s. 6d.—Dr. Hunter Lane's Compendium of Materia Medica, 18mo. 5s.—Dr. W. E. Channing's Works, with a new Preface by the Author, 4 vols. post 8vo. 24s.

Prevailing wind, S.W.

Except the 13th and 16th, generally cloudy, with frequent and heavy showers of rain; wind very boisterous on the 21st.

Rain fallen, .9875 of an inch.

Edmonton.

CHARLES HENRY ADAMS.

### TO CORRESPONDENTS.

We have tried to get the "Old Garden Seat" into proper rhythm, but it will not do. The ideas are tender and pleasing.

**ERRATUM.**—In the Covent Garden critique, last week, for "To die or not to die," read "To be or not to be."

### ADVERTISEMENTS.

Connected with Literature and the Arts.

**MARYLEBONE LITERARY and SCIENTIFIC INSTITUTION,** 17 Edward Street, Square.—The Rev. Dr. Vaughan will commence his Lectures on the History of Ancient Persia, on Monday, January 27.—To these will succeed Lectures on the following subjects:—On the English Opera (second series continued), by Professor Taylor;—On Chemistry, by John Hemming, Esq.;—On Landscape Painting, by W. Rider, Esq.;—On Astronomy, by J. W. Wallis, Esq.

Terms of Subscription:—For the Lectures, Reading-Room, Library, and Literary Meetings, Two Guineas per Annum. Each Member is allowed to introduce One Lady to the Lectures.

### TO BOOKSELLERS and STATIONERS.

To be disposed of, a Business in the above Lines, to which is attached a Circulating Library. The Situation is one of the best in the Town, about Sixty Miles from London. Coming in, between 700l. and 800l. Satisfactory reasons will be given for the present Proprietor relinquishing the Business. The Printing and Bookbinding Trades may be added with advantage. For further particulars, apply to A. B. care of Mr. Groombridge, Panzer Alley, Paternoster Row.

### TO COUNTRY BOOKSELLERS.

Specimens of the Illustrations to the new edition of SIR E. L. BULWER'S WORKS, in Monthly Volumes, the publication of which will be commenced on the 1st of February, may be obtained by the Country Booksellers, GRATIS, if ordered of their regular Correspondents, to be forwarded with the Magazines.

Conduit Street, Jan. 20.

### SCENERY OF PORTUGAL and SPAIN.

By GEORGE VIVIAN, Esq.

Drawn on Stone by L. HAULLE. This Work, which is uniform in style and execution with Mr. Vivian's former Work on Spanish Scenery, contains Thirty-five Views of some of the most interesting or most picturesque Spots of the Spanish Peninsula.

Price, imperial folio, neatly half-bound, 4l. 4s. London: Published at 14 Pall Mall East, by Paul and Dominic Colnaghi and Co.; and by Ackermann and Co. Strand.

### MAPS OF THE SOCIETY for the DIFFUSION OF USEFUL KNOWLEDGE.

The following Numbers are about to appear, viz:—No. 81. Asia and Australia, on the 17th February, the publication of No. 82. Plans of New York and Parma, 24th February. No. 83. Prussia, General Map, and Ancient Africa, 24th March.

No. 84. Italy and Germany, General Maps, 27th April. 30 Lincoln's Inn Fields, 20th January, 1840.

### BOOKS IN THE PRESS.

On the 1st of February, price 3s. 6d.

### THE COLONIAL MAGAZINE,

No. II. Edited by ROBERT MONTGOMERY MARTIN, Esq. Contents:—1. Colonies in their Commercial Relations to the Parent State: Poem from the Canarese, on the Death of Tippon Sultan.—2. Advice and Information for Emigrants.—3. Colonial Banking.—4. Maritime Resources of France and the United States.—5. French Colonies: Martinique.—6. The Resources of Upper Canada, and the Value of that Province to England.—7. China: Its Area, Population, &c.—8. French Aggressions on the British Flag.—9. State of Religion in the British Colonies.—10. Reviews of Books.—11. Colonial and Home Commercial Intelligence.—12. Colonial Biography.—Prices of Colonial Produce.—Shipping Intelligence.—London Gazette.—Statistical Tables of British Colonies continued, &c. &c.

This is a solid and able publication, which will be of infinite value both to the mother-country, and to those wonderfully extensive colonies which are carrying the English language and civilisation from pole to pole.—*Literary Gazette.*

Fisher, Son, and Co. Newgate Street, London.

### THE METROPOLITAN

for February will contain, among others, the following Original Articles:—

1. Memoirs of an Italian Exile, written by Himself.
2. The Dead Child. By Miss Edward Thomas.
3. Note-Book of an Irish Harpist: the Right Hon. A. Malone.
4. Lines written in Barbadoes.
5. The Coralines. By the Author of "Rattlin the Reeler."
6. The Motherless. By Mrs. Abby.
7. Public Punishments and Police Reports.
8. Autobiographical Sketches. By Mrs. Crawford.
9. The Pillar of Nive.
10. Lord Killickie. By Abbott Lee.

### NEW MAGAZINE, ILLUSTRATED BY PHIZ AND GILLRAY THE YOUNGER.

On February 1, price 1s. 6d. No. I.

**THE LONDON MAGAZINE,** CHARIVARI, and COURRIER DES DAMES: a Practical in Politics; a Chameleon in Literature; and a Butterfly in the World of Bon Ton. With Illustrations, viz. "David Diddie and the Lord Mayor's Daughter;" "Colonel Siskap amonishing the House at Midnight;" with Accurate Likenesses of Lord Russell, Sir H. Peel, Viscount Palmerston, Lord Stanley, Viscount Morpeth, Sir J. Graham, Messrs. Goulburn, Shell, O'Connell, and Home, and a faithful Sketch of the Reporter's Gallery and its Occupants; a Meditation of Lord Brougham; and a projected Royal Cipher for Their Majesties, encircled by the Insignia of the Order of the Garter.

London: Simpkin, Marshall, and Co.

On the 1st of February will be published, THE FIRST VOLUME OF A new and beautifully illustrated edition of THE WORKS OF SIR E. L. BULWER, Bart. M.P. M.A.

In Monthly Volumes, price Six Shillings. WITH ENGRAVINGS FROM ORIGINAL PAINTINGS, BY THE FIRST ARTISTS. The Series will commence with RIENZI; OR, THE LAST OF THE ROMAN TRIBUNES. With Engravings from Paintings by McClise and Creswick, on the 1st of February.

The succeeding Volumes will appear regularly on the 1st of every Month. Publishers, Conduit Street, Hanover Square, London. Agents—for Ireland, J. Cumming, Dublin; for Scotland, Bell and Bradfute, Edinburgh. Orders received by all Booksellers.

### ENCYCLOPEDIA HERALDICA; or,

complete Dictionary of Heraldry. By WILLIAM BERRY, Late and for Fifteen Years, Registering Clerk in the College of Arms.

On the 1st of February next will be published, on demy wore paper, Part First of this Work, to be continued Monthly, and completed in about Forty-eight Parts (forming Three handsome 4to. vols.), each Part containing Forty-eight pages of Letter-press and Three explanatory Engravings, price 3s. 6d.; being reduced one-half of that of the original Work, which cost the Author upwards of Five Thousand Pounds in its production, but which he is now enabled to reduce so considerably in price from not having again to incur the great expense of collecting and engraving. London: Sherwood, Gilbert, and Piper, Paternoster Row.

### NARRATIVE of a VOYAGE to MALDEIRA, TENERIFFE, and along the SHORES of the MEDITERRANEAN; including a Visit to Algiers, Egypt, Palestine, Tyre, Rhodes, Telmessus, Cyprus, and Greece. With Observations on the Present State and Prospects of the East; and an Appendix on Climate, British Commerce, Antiquities, &c.

By W. R. WILDE, M.D. (Dublin).

London: Longman, Orme, and Co. Dublin: Curry and Co.

### GREYHOUNDS and COURSING; including, also, Hare Hunting, Deer Hunting, Stag Hunting, Fallow Deer Hunting, Deer Stalking, Otter Hunting, Badger Hunting, &c. &c.: being the Fifth Part of Blaine's "Encyclopedia of Rural Sports."

Ought to be in every country library, from that of the nobleman to the tenant farmer.—*British Farmer's Magazine.*

London: Longman, Orme, and Co.

### THE PENNY CYCLOPEDIA of the

Society for the Diffusion of Useful Knowledge. The Sixteenth Volume of this work will be published on the 1st of February, 1840, and the entire work will be completed in 1841. During the course of this publication in Monthly Parts, many persons have expressed their intention to defer its purchase till the work was finished. New Subscribers have now an opportunity of commencing this purchase by a gradual expenditure of Seven Shillings and Sixpence each Month; with the assurance that such an outlay will, before the termination of 1841, put them in possession of the most complete and accurate, and at the same time the cheapest, Cyclopaedia ever published. The Monthly issue in Volumes will commence on the 1st of February; and those who are unacquainted with the work may consult a specimen volume at any respectable bookseller's—the Publishers having distributed a large number of Copies throughout the country for this object.

London: Charles Knight and Co. 23 Ludgate Street.

### BREEDS OF CATTLE, &c.

**PROFESSOR LOW'S ILLUSTRATIONS OF THE BREEDS OF THE DOMESTIC ANIMALS OF THE BRITISH ISLANDS, Part I. atlas 4to. with Four beautifully-coloured Plates, comprising Seven Figures of the Wild or White Forest Breed, the Pembroke Breed, and the West Highland Breed, with Descriptive Memoirs, will be published on Feb. 1st, price 10s. the Guinea.**

London: Longman, Orme, and Co.

### BOOKS PUBLISHED THIS DAY.

In post 4to. 10s. 6d. neatly bound.

### THE THEORY and PRACTICE of

BOOK-KEEPING, illustrated and simplified.

By B. F. FONTÉL, Accountant.

The object of this work is to point out important defects in the common mode of teaching the art to suggest the means by which those defects are obviated; and to introduce to the notice of teachers a simple, rational, and philosophical process of instruction, whereby the Principles of Double Entry are clearly unfolded, so that any person of ordinary capacity can obtain such a knowledge of the subject as will enable him to investigate and adjust the most intricate and diversified set of accounts.

J. Souter, 131 Fleet Street.

### THE FRIGHT. A Novel.

By Miss ELLEN PICKERING.

Authors of "The Merchant's Daughter," "The Heiress," "Nan Darrell," &c. &c.

"These are example, which will, as they ought, bespeak a fearless reception for 'The Fright.'—*Literary Gazette.*"

"This is an extremely well-written novel, and quite equal, if not superior, to any similar productions of the present day."—*Morning Herald.*

"It is seldom that we have had a novel submitted to our judgment so entirely faultless in design and execution, as the one now before us."—*Parthenon.*

T. and W. Hoone, 29 New Bond Street; Oliver and Boyd, Edinburgh; J. Cumming, Dublin.

**HOURS OF THOUGHT; or, Poetic Musings.**  
By J. N. HARDY.  
"But is amusement not to Studios of song,  
And yet ambitious not to sing in vain,  
I would not trifle merely: I would be the world  
Be loudest in their praise who do no more."—Comper.  
Harvey and Darton, 55 Gracechurch Street.

**CAPTAIN CHAMBER'S NEW NAVAL STORY.**  
Now ready, at all the Libraries, in 3 vols.  
**THE SPITFIRE.**  
A Nautical Romance.  
By CAPTAIN FRÉDÉRIC CHAMBER,  
Author of "The Life of a Sailor," &c.  
"Another tale of the sea from the pen of Captain Chamber, to whom the public is indebted for so many amusing stories. The chief merit of this tale lies in its numerous and stirring incidents, many of which are replete with spirit and dramatic fact; and among them we may mention the scenes which take place at the pirate's cave; the murder of the old negro; the execution of the chief mate, Carlos; and, above all, the chase of the Spitfire by the French frigate Hebe."—Sun.  
Henry Colburn, Publisher, 13 Great Marlborough Street.

### REVIEW OF NEW BOOKS.

*Records of Real Life in the Palace and the Cottage.* By Miss Harriott Pigott. Revised by the late John Galt. 3 vols. 12mo. London, 1840. Saunders and Otley.

THE author having moved in the best circles of society, and travelled a good deal on the Continent, has, in these volumes, presented us with many pleasant reminiscences of her sojourn and associates. Like the letters *T* in her own name, there is, perhaps, more than is necessary or enough; but still there is so much to please and amuse the general reader, that for those to whom, unlike ourselves, time is not an important object, the talent for scenic description, the love of nature, the female perception of manners and character, the incidents (though few), and the number of interesting personages who are brought under observation, form a miscellany in the way of light and polite literature which we can safely recommend to the upper classes for their entertainment. If we are not mistaken, Miss Pigott is the author of "*The Private Correspondence of a Woman of Fashion*;" to which, at any rate, we think the present volumes bear a strong degree of resemblance.

Before we run cursorily over these *Records*, we must pause on a touching anecdote relating to our old and valued friend, John Galt, whose latest literary labour it must have been to revise them. The introduction informs us that he "adopted Miss Pigott's MS. with intense interest, and beguiled much time in revising its pages. The preface and notes were the last efforts of his mental powers, which circumstance must give an increased interest to a work that requires no extraneous assistance to enhance its value. The mutual infirmities of the blind sister and her brother prevented their ever meeting, although the same roof sheltered both. The hapless survivor observed, in the awful stillness that pervaded her now desolate dwelling,—'I do not hear the sound of his chair wheeling on the floor above my head. Wo is me—how I miss it!'"

The chief charm in Miss Pigott's work is, perhaps, its pictures of domestic life, and though we cannot go Galt's length in comparing her with Lady Mary Montague, we must, in this respect, assign to her a foremost rank among English writers. The letters in the first two volumes are principally written from places of summer resort in the Low Countries and German Spas, and we select from them such examples as we deem best calculated to exhibit the writer and interest the reader. The first extract, however, involves a little personality, and occurs in an epistle from Spa:—

"A Mr. Cottrell possesses several villas in these districts. He is an Englishman, who has acquired great riches, *on dit*, by betraying to a foreign nation the secrets of the machinery of one of the most considerable branches of the commerce of his country, at the period when to export machinery was prohibited,—a gross, uncomely figure, pompous in his mien and conversation;—the pride of riches is a sorry ambition, and of all the shades of pride the most repulsive, and the one that most strongly implies mediocrity of intellect; but which, un-

fortunately, has the greatest success in crushing modest merit. This new-fangled gentleman invited us to view his villa, situated on an eminence dominating the town. We found it in a neglected, comfortless state, the garden overrun with rank weeds, which may be thought emblems of the proprietor's mind. On Sunday we crowded round a balloon, to which we had been invited by a pompous *affiche*, 'Ascension Érostatique.' What was its ultimate aerial fate, I could not learn. This was another futile attempt to soar in those ethereal regions that seem to be appropriated by the Deity exclusively to the winged race, but which the rapid progress in science will probably one day improve so as to render it useful. Perhaps if our enlightened men of science would condescend to study more closely the hints given in an old Italian work, by the celebrated Borelli, they would arrive sooner at the completion of their design. If I mistake not, the said Borelli inculcates that the combination of weight and power in the formation of a bird would furnish them the best rules."

We have continued this extract for the sake of stating a hearsay, that the advice thus given has been adopted by an inventor in the north of England, who, by means of certain machinery, as we are assured, will very shortly shew us the way to rise in the world, and to direct our course in the upper regions after we have risen.

A letter from the Hague, December 1817, affords an instance of remarkable prescience. The passage we allude to is as follows:—

"I indulged myself in a walk, alone, to Vorkbourg, a pretty, cheerful village; my path back again led along the side of canals, bordered by neat country-houses, entirely devoid of picturesque beauty or interest of any kind. I found an invitation to dine at the admiral's. The party were Mr. and Mrs. Stivers, and their son, a young mariner who served under the admiral at Algiers; the spirited youth regretted that Lord Exmouth had not entirely destroyed that piratical savage power; an inconceivable forbearance on the part of Lord Exmouth, that I hear frequently regretted, and that England will one day have to rue bitterly when some other state will conquer it and keep it; England's false generosity oftentimes proves detrimental to her real interests."

But we pass from political hints to a lively description of the village of Brock, near Saardam, and the wealthiest in Holland. Miss P. says it is—

"A most strange example of the exaggerated Dutch taste for neatness and gaudiness. What whimsical scenery! divided by canals and diminutive bridges, each house standing apart, built of wood, fluted and painted in various gaudy colours, each of them surrounded with a garden of proportionate size, the walks decorated with coloured sea-shells, and glass beads, and the shrubs and trees cut into fantastical shapes, the village has really the appearance of a child's toy, or baby house. The inhabitants appear as whimsical and extraordinary as their dwellings; if a horse passes, leaving the traces of its footsteps, out comes some one with a rake; as I was walking along with my ser-

vant, rather carelessly, trailing on the ground a parasol, a servant rushed forth with a sieve full of sand. Its solitariness imparted an uncomfortable sensation of desolation that overpowered the pleasant feeling of gratified curiosity, for it was impossible to avoid the idea that the former inhabitants had been removed by an epidemic malady to another world. The custom of closing the shutters in the front of the habitation, and living in the rooms at the back; the door in front elevated, and without any steps to descend from it—these doors being never opened, but on the occasion of a marriage or a funeral, when the clerk officiates in the double capacity of minister, lays the Bible upon the coffin, and reads a chapter from it on the subject of the briefness of life; augments and confirms the gloomy impression. These rich inhabitants are so inhospitable, and so suspicious of strangers, or so fearful of their injuring any thing or disturbing their soil, that it was impossible to make my way into the garden of one of these houses. I entreated permission to peep in at the gate, just to admire its neatness and orderly arrangements—no polite compliments could even induce the female who valiantly stood on the threshold (her head-dress decorated with pearls and gold ornaments under a peasant's straw hat), to permit me merely to peer within. 'She was going to church,' 'she had no time.' The husband gently drew his pipe from his mouth to intercede for me; the wife was resolute, from which circumstance I may fairly conclude that to the other perfections and ancient customs of this pasteboard-looking village may be added, that the wiles rule with despotic sway. The shops only are in front of the houses; there self-interest prevailed, for I was civilly invited to enter one of them. A sign over the door, emblematical of the merchandise on sale within, was not ill painted—the figure of a negro surrounded by the products of his warm native regions. It is not permitted to erect an inn, but at the most distant part of the village; a pair of pantoufles is kept at the door of each house for the persons who visit it, from fear of their leaving any dirt; the streets are paved with tiles, which are washed and polished with a brush—then covered with sand, on which is traced various figures and designs. Many wear a capuchin, which is a hood of black or blue stuff, or silk, sometimes scarlet. This is very becoming; their hair is decorated with valuable trinkets; otherwise this custom would give them the appearance of *religieuses* of convent order most severe."

The following is some parts of the picture of one of the smallest German courts, the Château d'Allner, belonging to Prince Hatzfeldt, in the Duchy of Berg:—

"The prince in person inspected the arrangements of my trunks; and after looking around, to assure himself that every thing might conduce to my comfort, his excellency left me to arrange my dress for their early dinner. 'Twas in the space of a few minutes I was established, without any of those factitious ceremonies and parade that estrange frank intercourse. The interior of this château does not assimilate with the ancient dignity of its architecture,

for all is modern in the arrangements within. It was pillaged and almost entirely gutted during the last thirty years' troubles and war-fares; and this noble seigneur, in rendering it habitable, has prudently only consulted simplicity and comfort; a few stray, old, blue damask silk fauteuils, are the only vestiges of former sumptuousness. The apartments are commodious, having free egress into each other, that the prince and the ladies of his family occupy; the hangings of the apartments are white cotton, every thing being designed for utility and immediate convenience.

"The domain is in correspondent taste. The kitchen-garden is a picture of neat cultivation; and, with the orchard, was shewn to me with as much satisfaction as an English squire exhibits his range of expensive hot-houses, his park of deer, his stud of blood-horses, or his pack of well-trained fox-hounds. Here, Nature has done every thing; the prince has aided her only by cutting rude walks through the woods, and over the mountains, with rustic benches appropriately stationed, to repose, and catch the most interesting points of view at every step; *son aïeule* turns to ask me, with a look of proud content, 'Is not this better than your English lawns, and formal-cut gravel walks?—leave formalities for great cities.' Indeed this high-born prince seems to retire to the country to disembarass himself of state and state affairs. Here he appears like a good patriarch in the midst of his family; the hours and manner of living are almost pastoral. We rise at seven o'clock, being obliged to appear at the breakfast-table, not in *negligé* toilet like the French, but in a neat morning costume, soon after eight o'clock. The breakfast is served without table-cloth or plates, consisting of bread, butter, fruits, and confectionary, with coffee: as they had seen me breakfast at Aix-la-Chapelle, they have added, on my account, tea and eggs; and, as there were no egg-cups, I was necessitated to hint that a napkin and plate could alone relieve my embarrassment. After the breakfast repast, we separated instantly to our apartments and our different occupations; mine assimilating with those of my young friends, and my rooms opening into theirs, we pursue them together: they delight in cultivating the English language, and reading some English literary work, whilst I paint or sketch their portraits; at intervals the lively, capricious Fanny, will seize her guitar, and throw aside her books; sometimes we are joined by their uncle, the Comte Hugo, who pays his court to me assiduously, taking a malicious pleasure in irritating my patriotism, by disputing with me the glory and power of my nation, and also in committing (what he calls) the terrible sin of entering an English lady's bed-chamber,—generally bringing his guitar to amuse, and charm us for an hour with pretty Spanish and Sicilian airs: it is true his voice is somewhat cracked by age and use; and when I venture to look at him, the affectation of youth, and the *gestes* of the old beau, are somewhat ludicrous and diverting. If the weather is not too sultry, the prince summons us for a walk previous to arranging our toilet for dinner, which is served at half past two o'clock. A simple repast of very plain cookery is served with neatness upon a round table; no massive silver services decorate the side-board or table, war and revolutions having long since melted them down for public use; but genuine hospitality and mutual confidence have superseded these luxuries and pageantry, diffusing gaiety over the social meal. It is long since the brothers, Hugo and Max,

and their nephews, have thus met together. I have named it the family congress. The prince presides at the banquets, having me on his right hand: unlike his dinners at the Hague, the viands are placed on the table, and he serves each dish himself. 'This soup is excellent,' he said to me to-day; 'I superintended the mixing of the ingredients, and there is some macaroni coming dressed in a new way; I think you will like it.' Great apparent cleanliness pervades every thing; it is only in certain personal tricks habitual to the Germans, that they are unpleasant;—that terrible habitude I have before remarked to you of spitting on the floor, or between their knees under the table, and that of raising the pointed knife as a tooth-pick, is to me a continued annoyance, being, during the dinner, obliged to resort to the most artful stratagems to prevent the prince taking the same knife to cut the *roûti*. Each lad, and gentleman will, perhaps, bring to table, or draw from their pockets, a vast and richly ornamented tooth-pick case, placing it by his knife; but it is rarely that the knife is not preferred, for in the middle of an interesting conversation with her fascinating cousin, the aide-de-camp Fritz de Nesselrode, I see the fair and delicate hand, the well-turned arm of the young and blooming Comtesse Fanny, grasp and elevate this instrument of carving, extend her pretty mouth, and stick it between her small ivory teeth. Conversing this morning on the customs of different nations, with all the freedom and frankness that intimacy authorises, arguing upon their utility or inutilty, I ventured to make an observation upon the impropriety of thus injuring her pretty teeth, and, perhaps, risking to enlarge the dimensions of her pretty small mouth by an unfortunate jirk of her hand, or gentle touch of her favourite cousin, Fritz; 'Besides, the princess, your mother, never does it.' 'True,' she replied; '*vous avez raison*; I will endeavour never to do it more, for it is certainly very ungraceful.' To take our dessert and coffee, we always immediately adjourn to a flower-garden, surrounded by a trellis-fence of roses; beneath the shade of two large spreading cherry-trees, from which we cull the fruit as we sit under them; with the dessert, the domestics bring the pipes of old Comte Max, and the two aide-de-camps; on that of uncle Max is engraved the ten commandments. The princess only permits them to smoke in the open air, and there I do not think it disagreeable. My devoted le Comte Hugo is too much the polished, refined gentleman, to condescend to smoke; he is quite a man of the world, and has visited other courts; old beau, coquetting, *plein d'esprit*—a humorist, searching for and enjoying the different characters he encounters in life, as much as the scenery and the arts. Although sixty years' sojourn on earth have silvered his locks, and nature has not been bountiful to his person, he still retains so favourable an opinion of his personal *agrémens*, that, at the dessert to-day, he rose in a rage, because I would not correct the traits of his portrait I had sketched, more to his satisfaction. '*Ma bouche, mademoiselle; j'ai eu toujours une bouche intéressante.*' The *voiture* then comes to the garden gate; with four horses, high-fed, high-spirited, seldom worked, harnessed in the Prussian fashion, and appearing to scamper at will, we dash through the rivers, fords, the most beautiful landscapes, so beautiful, so varied, that no pen, no pencil, can do them adequate justice."

At Baden, our author displayed some female tact in procuring her bedchamber to be cleaned

out, and we quote the lesson for future tourists:—

"Not a corner could be obtained, and I was returning discomfited, and embarrassed as to what procedure it would be prudent to adopt, when I fortunately encountered Mr. Sharpe, to whom I had recently shewn some civility at Mannheim; and his influence soothed the chiefs at the Hôtel de Bade, and installed me in the modest apartment I had previously so scornfully rejected. This useful negotiator philosophised upon the theme of whitewashed chambers, and beds without curtains, as a useful temporary adversity, and salutary penance for an English fine lady, finishing his oration by exhorting the chambermaids to wash the floor, the table, and the chair; he then left me to change my dress for the *table d'hôte*, which is, throughout Germany, at the early hour of one. To secure a complete cleansing of my chamber and its furniture, on the part of the German chambermaids, I purposely overset a pail of water that I found at the door, then overturning chair and table to float therein. I descended the stairs amidst the no very amicable vociferation of the phalanx of chambermaids."

Before touching on other princely matters, we may note some of our own at Brussels (June 1818), and especially one on his way to win that lady who became the mother of our youthful Queen:—

"The Duke of Kent was in low spirits, the few days he was here last week; this separation from Madame St. Laurent is a great chagrin, and sacrifice to state policy; they lived together twenty-six years; she is an accomplished woman, and was not publicly obtrusive. She has engaged a mansion in Paris, and it is said that Louis XVIII. will have the complaisance to create her a baroness. The duke's motive for his retirement to this city was to pay off his debts; he has left it with the good opinion of all classes. I fear the amiable widow, the German princess, will find him a melancholy royal suitor for her fair hand. Not so the Duke of Cambridge: I met his royal highness during his short visit, *en passant*, to England; he seems the happiest of happy bridegrooms, displaying it undesignedly to a pleasing-looking, amiable bride, a princess of Hesse. Her figure is elegant; the upper part of her face is quite handsome; her complexion has a tint of sallowness, inherent to the German women. The duke called upon our little friend Mrs. Byam, and told her he was the happiest of men; passed her children in review, and renewed his promises of protection to her fine-spirited fatherless boys, and it is proverbial that the Duke of Cambridge never forgets to fulfil his promises."

Again at Baden:—

"The English, from a sentiment of spurious pride, prefer a sulky repast in their own *chambre à coucher* (for private saloons, as at an English inn, are seldom to be procured), to eating at the same convivial board with those of inferior rank, though he is almost certain to meet also with others of equal and superior station to himself; for all etiquette of this nature is waved,—the prince and the untitled hero mix in social converse; the waiter, who generally carves each dish at the sideboard, also assigns your place at the table, from the date of your arrival. While the English continue in this humour to avoid the natives of those countries their restless spirit induces them to invade, they might save themselves the expense of quitting their native isles, and content themselves to inspect the numerous picturesque beauties, the woods, wilds, the mountains, and the lakes, and all the

other picturesque scenery, wild and cultivated, the bounteous hand of God has scattered over the surface, and of which one-half of those wandering people know nothing. I am more diffuse on this point, perhaps, from having already formed a most agreeable and eligible acquaintance in the old and respectable Baroness de Bleitwitz, the baron her husband, and her sweetly modest and pretty daughter; they are of the little German court of Saxe-Meiningen; the baroness was *dame d'honneur* to the duchess, mother of the princess who has lately espoused our Duke of Clarence, and to whom we now look to extend our line of kings. On naming, accidentally, this recent royal marriage, commenced our intercourse; the old baroness is enthusiastic in her panegyrics on the mild virtues, the gentle and pious character, of her who may one day fill the throne of Great Britain. The baroness, to use her own expression, received her at her birth 'in my apron.' Madame Bleitwitz was the chosen youthful companion of her highness, who, on bidding her farewell, presented her a little mother-of-pearl model of a ship; *un souvenir*, her highness added, of her wish that Mlle. would visit her in England.

"The Princess Amalie [of Baden, sister to the Queen of Bavaria] has neither elegance nor personal beauty, but her countenance has a thousand charms—it is the emblem of her mind, like a mirror to the face and figure, and reflects the benevolence of her character; she creates immediate interest, and I believe our government fixed upon this princess for the Duke of Kent, last year, when the death of England's hope, the lamented Princess Charlotte of Wales, rendered it good policy that her royal uncles should marry. Certain it is, that the duke came to Karlsruhe, and as I have learned from one of that court, the princess was extremely anxious to please his royal highness; therefore the court ceremonies were so well arranged, as to place the royal duke in the same carriage, *tête-à-tête* with that princess, to make the usual tour of sights, and to attend the review of the Baden army. But the duke took his leave on the following morning, and, as we all know, soon after selected the widowed Duchess de Leiningen, who, in her character of wife, widow, and mother, possessed a high reputation, with the advantages of youth and some beauty. To the fraternal affection and diplomatic manoeuvres of her brother, the Prince Leopold of Saxe-Cobourg, may be attributed this royal marriage; for even during his short domestic life with his royal consort, our lamented Princess Charlotte, he would find occasions to converse of his sister, and her domestic sorrows, to the duke, and thus, imperceptibly, creating an interest in his breast. At the moment when the royal brothers rushed in patriotic matrimonial Quixotism to the continent, in search of Protestant consorts who might give an heir to the British throne, Prince Leopold adroitly charged his royal uncle-in-law with a precious packet, with an urgent request that he would deliver it in person to his widow sister, as he said it was 'too precious to intrust to a mercenary or to his aide-de-camp.' It was therefore apparent, during the duke's short visit at the court of Baden, that there was a degree of impatience to proceed forward on his journey, which created a suspicion that he was preoccupied with other matrimonial projects. This amiable, high-minded princess, preserves an esteem for the Duke of Kent, unmingled with that pique which many women would have felt; for some days after, at the queen's evening re-

ception, remarking the family of L—e, she inquired from whence they came, and when informed that they came from Brussels, she demanded, in an impatient tone, whether they had been implicated in the late insulting opposition to the Duke of Kent in the church affair, adding, 'If they were, I shall not notice them.'"

With these court anecdotes, so nearly connected with the younger branches of our present royal family, we must, at least for the present, conclude; but should we not be able to return to Miss Pigott's volumes, we beg to repeat our introductory remark, that they contain much agreeable and amusing matter.

*A Pilgrimage to Palestine, Egypt, and Syria.*  
By Marie-Joseph de Geramb, Monk of La Trappe. 2 vols. post 8vo. London, 1840. Colburn.

FROM a glance at this publication, we are suspicious that there is a good deal of trap in having our old acquaintance the Baron Geramb's name and title on its title-page. Had it been the Baron as we remember him, the superb in lith and limb, and the glorious in moustache, the admiration of London, and the wonder of the wide world, we should not have been surprised at Mr. Colburn's coaxing him into the authorship of a book of travels; but the Monk of La Trappe, after seventeen years of seclusion from the fellowship of mankind, the most severe of the orders who utterly renounce all earthly feelings and concerns; the devoted to heaven and austerities; the dumb, who hold converse with their own gloomy brotherhood only by signs; the death-seekers, who dig their own graves, and take ascetic delight in daily and nightly stripes, while they indulge in contemplating the handy-work in their final resting-place;—for one of these, we say, to break his bounds, and set out on a pleasant travel of two years (though the Holy Land and sepulchre be the apology), is truly astounding; and then to observe how like an ordinary traveller or book-maker the Baron writes; one would swear he had never seen La Trappe in his born days. To authenticate the narrative there ought to have been a portrait (instead of two Palestine views by Mr. Arundale); and if, instead of an Umbra or Eidolon, it were the real, genuine, and true Baron, his beard and whiskers would have proved the personality and the fact. *N'importe*; notoriety was ever the illustrious baron's hobby, and even if it were his Ghost or his Pseudo, we dare say the same mania would attend it. As such, we shall bestow a very short notice upon the work, in which we discover little, except manner, which could not be compiled out of preceding books.

The Baron pretends that he was released from his beloved monastery by the revolution of 1830; and, after a stay in the Convent of St. Urban, got warranty and letters of recommendation from the Pope and College of Propaganda to visit Syria and Palestine. He accordingly sets out pretty much like an ordinary tourist, and, unlike a man who had renounced the world, seems to take a very everyday interest in the most common occurrences.

"I shall start to-morrow, notwithstanding my precarious health, notwithstanding the dangers of which your friendship for me causes you so much apprehension," is the language of a monk of La Trappe, who has just come out of a living grave! "I must confess that, at my age, scarce recovered from serious illness, the plague which is ravaging the countries that I am going to visit, and the troubles prevailing

there, would be enough to intimidate me if I were running after the perishable riches of this world." How much for the copyright—eh?

Letter 2d. "I shall embark on the enchanting lake for Alost; and then the question is set in its proper light by the writer himself, who tells us, 'The diet has to-day opened its session. I had received several tickets for the ceremony, which is rather curious, on account of the singular dresses of the ushers. But, though it was the day on which the fever leaves me a little ease I did not comply with the invitation. Ah! what to a monk, above all to a monk of La Trappe, a pilgrim to the Holy Land, are all the vain ceremonies of the world?' What indeed! "At length (he proceeds) I have bidden adieu to Lucerne, and, to avoid eight or ten hours' navigation, which might have been attended with some danger in my state of convalescence, I resolved to take a carriage to Fluelen, and there I embarked. Oh! what a lovely day! what a magnificent lake is that of Lucerne, and how sorry I am that my illness prevented me from visiting in detail its enchanting shore! I determined, however, to cross it from Fluelen to Alost. I wanted to see, to feel, to admire. Is not nature an exquisite prayer-book? How much is he to be pitied who does not perceive God in the beauties which, with lavish hand, he has scattered over this wide world!"

Then why enter La Trappe, good Mr. Baron? Was that a place to worship nature's God through the loveliness of his creation? To adopt a phrase from natural history, you seem to let the cat out of the bag. Instead of a Trappist, we might fancy it was Prince Pückler Muscau on his travels. Only list:—

"I left Venice at seven in the morning. The admiralty gondola came to my hotel to fetch me. The captain of the port had kindly caused such necessities as I should want for the voyage to be purchased for me. I proceeded to the lazaretto, a short league from Venice, and then went on board the ship. The Austrian flag was hoisted on my approach. I was received by the captain, the mate, and the crew."

We go onward for two or three paragraphs more to shew that the want of *Trappishness* runs through the work. At Jaffa, the late anchorite says, very like a sentimental French writer:—

"I looked with a feeling of pleasure, and a sort of gratitude, at the frail vessel which had conveyed me to Palestine. Such is the way with man; a passenger in this great vale of tears, he suffers his soul and his immortal affections to cling to every thing that surrounds and is close to him. Alas! never was I to behold that vessel again: a few hours afterwards she struck upon the rocks, which render the road of Jaffa so dangerous. She was completely wrecked; the crew were saved, after having undergone all the horrors of death. Had I continued on board a few moments longer, I too might perhaps have by this time been no more. At the moment that I am writing these lines, the fathers of the Holy Land would probably have been employed in removing my body, extended on the beach; and after a few hours passed in the church, amidst funeral chants, they would have carried it to its last home. The Arab, on seeing the procession, would have inquired whom they were interring. 'We know not,' would have been the reply of one of the fathers; 'it is a pilgrim from the vessel that has just been wrecked; from his dress he appears to be a monk.' And the cold earth would have

covered me, the while not one friend would have stood beside my grave, not one tear would have dropped upon my coffin; and, upon the little mound of dust, formed by my mortal remains, never would there have been seen the print of the knee of a creature that had loved me!"

What would there have been at La Trappe? The next much resembles the statistics of a bookseller's hack:—

"Most geographers assign to Jerusalem only seventeen or eighteen thousand inhabitants. If I may depend on the information that I have collected on this head, and I have good reason to believe it to be correct, this city now numbers nearly 21,000 inhabitants, composed of

Turks .....	13,000
Jews .....	4,000
Greeks .....	2,000
Catholics .....	1,000
Armenians .....	600
Copts .....	50

20,560

In this number are not included the travellers whom curiosity or business brings to Palestine: and, still less that multitude of pilgrims of all nations, drawn thither by the pious wish to visit and honour the holy places."

But the Baron of La Trappe warms as he journalises; and, in his second volume, gets to be quite facetious on subjects of high Christian (though mistaken) feeling, and in cracking jokes with Mehemet Ali, the famous and extraordinary Pasha of Egypt. We cite two specimens. At Tiberias, the Baron and his guides were inconvenienced by curious visitors; and we are informed,—

"Among these were several Jews, who, to my extreme surprise, without ever having set foot in Germany, spoke German perfectly. It gave me real pleasure to chat with them a few moments. I knew not that persons of their nation formed two-thirds of the population of Tiberias; and that they had skilful masters, who taught them our language. According to their account, a great many of them are descended from families settled on the same spot, at the time of Jesus Christ. So much is certain, that their synagogue is considered as the first in the East; and that their rabbis are reputed to be very learned. Foreign professors of their religion throng to their town, under the influence of the same feeling of devotion which impels so many to go to Jerusalem. Hither they repair from all parts of the world, with the intention of ending their days in this place. A tradition, generally accredited among them, declares that Christ will come from Capernaum to Tiberias: they are expecting him; and I have been told that the most zealous of them post themselves, in turn, on an elevated spot, and there, keeping their eyes constantly fixed on the ruins of the town from which the Messiah is to come, they stand sentry, in order to be the first to proclaim his happy advent. Nay, in reference to this expectation, I have heard a story of a wag, who, having at night fastened a number of lamps to a crazy boat which happened to be upon the lake, at a considerable distance from the port, made it move towards the town, on which all the Jews set out to meet the 'desired of the nations.' The tumult was great, added my informant, and the joy still greater, till the moment when the illusion was dispelled by the sad reality. Mehemet Ali left his capital almost at the same time that I did. Being informed of his arrival here, I thought that I could not avoid paying him a farewell visit. I went yesterday to his palace,

Rumour had already told him of my crocodile and my mummy: he made them for a moment the topic of conversation. 'Your highness,' said I, laughing, 'I am persuaded that a traveller returning from Egypt cannot decently shew his face in Europe without a mummy in one hand and a crocodile in the other.' This piece of pleasantry tickled him much, and gave me reason to suspect that he is pleased to see us natives of the West attach so much value to Egyptian relics."

After all this,—will our readers believe it?—the author has got safe back to Europe, and is now resident in the Convent of St. Urban!!!

*Some Account of the Falkland Islands, from a Six Months' Residence in 1838 and 1839. By L. B. Mackinnon, R.N., First Mate of H.M. Cutter Arrow. 8vo. pp. 79. London, 1840. Baily and Co.*

THE latest particulars respecting these important islands, once so famous in political controversy, afterwards neglected, and almost forgotten, and now, in good time we trust, again brought under the notice they deserve, by the few unpretending pages before us. The writer reviews the early history and mutations of the Falklands, mentions the settlements made upon them, and the circumstances of their destruction; describes their climate, soil, and capabilities; and, *inter alia*, tells us of their present condition, as British:—

"The wild cattle are certainly magnificent animals, and numerous in the east island. They are rapidly increasing now that foreigners and marauders are kept off, although there is still a disproportionate number of bulls. It is very singular that on the north side of this island, as far as Port Pleasant, the cattle are generally of a dark colour, some bulls being of the most jetty black, with long shaggy hair about the head and neck; to the southward they get lighter and lighter, until, at the extreme south, at times, you meet with whole herds of a beautiful white colour. The bulls are much larger in proportion to the cows; some of them seem of a different breed, from the great height and development of the shoulder, and comparatively low quarters; these we generally found very cunning and ferocious, and most dangerous to attack. From the collective opinions of Mr. Sullivan, the Capatzo of the Gauchos, and my own observation, I should think that thirty thousand head would be a moderate computation of their numbers, nearly one-third of which are bulls. The wild horses never leave the north side of the island, which is most singular, as there is no obstruction; it has never been satisfactorily accounted for. They are excessively shy and timorous to a party, but Captain Fitz-Roy observes that they will form a circle round a single man, and prance upon him; however, a musket will readily disperse them. Their average height is about fourteen hands two inches, lighter built than the generality of South American horses, with no great powers of endurance, and sadly cow-hocked, or cat-hammed; but, to make some amends, they are as active as cats, and have very well-shaped fore-legs, the fore-arm long, muscular, and strong, a short flat shank, with well-bent postern. The stallions, as well as the bulls, are very fierce and pugnacious with one another. One horse, a fine stallion, which was shot by Mr. Sullivan, had the near hind leg, just above the hock joint, broken (we supposed by fighting). Nature had gone a long way towards a cure, and no doubt remains on my mind that he would have quite re-

covered had not our party come suddenly on him. He seemed to gallop off with a slight lameness, and even after Mr. Sullivan's unerring bullet had pierced his lungs, he went three hundred yards before he fell dead. Several bulls, also, that we killed bore very significant marks of the combats they had been in; three of them were lame, from old and imperfectly cured fractures of different limbs. The stallions do not bear the same proportion to the mares, as the cattle, by a great deal. From what we saw and heard, Mr. Sullivan agrees with me in thinking that their numbers altogether do not exceed twelve hundred. I cannot here forbear mentioning a story of one of the Falkland stallions, told me by Corinet (a Patagonian Indian, acting as a gaucho), as we were exploring together. The horse I was then riding, called Teniente, had been captured, some years ago, during Don Louis Vernet's government, but was found so vicious, ferocious, and cunning, that not one even of the gauchos could manage him. After having resorted to every method they could think of to subdue him, it was proposed (this Corinet told me with a chuckle) by himself to take the animal some miles into the interior, and fasten him to a wild bull's horns. This, with the assistance of two or three lasses, was soon done, and the poor brute's tail was securely lashed with thongs of hide to the horns of the wildest in the flock. The gauchos immediately returned home, highly delighted with their exploit. The next morning, on getting up, the first thing they saw was poor Teniente with his head hanging down, looking very miserable and distressed, standing at the cral gate; he had killed the bull, whose skull was found completely beaten in. Teniente's heart was broken; he never even pretended to vice afterwards. The only quadruped that seems indigenous to the islands is the warral, or wolf-fox, a specimen of which was brought home by Captain Fitz-Roy, and placed in the British Museum.

"Wild boar, or rather common swine, run wild, are very plentiful on Eagle or Speedwell Islands, and on several other Tussock Islands; in these spots of land they thrive and increase prodigiously. Some big with young have been put on several other islands, well calculated for them, where there can be no doubt they will also prosper. The Tussock grass seems formed by nature for them, being capital food, and affording excellent shelter, warm, dry, and comfortable. Goats are also to be found on one or two of the islands near West Falkland; they also have increased amazingly, the original stock having been landed a few years ago by a whaler. Immense warrens of rabbits are to be found in several places, most, however, to the northward of the range of hills, as the original stock was landed at Port Louis by De Bourgainville, and in a wild state they did not succeed in crossing the hills; several small colonies of these animals are now, however, rapidly increasing to the southward, landed by Mr. Melville's vessels and by others. The first in the list of birds is the swan; they are not found in great plenty, but are very beautiful birds, the whole neck being a jetty black, and the rest of the body of a snowy white. The goose is also a very handsome bird, remarkably bold or stupid. I have killed several with a stick; they are found in immense numbers all over the islands. There are three kinds, the Upland and Brent, being very good eating, and the Kelp, so called from breeding and feeding close to the shores, where kelp is abundant. The plumage

of the hen is most beautiful, not resembling the common wild goose. A setting hen of that breed once struck me a severe blow, whilst trying to push her off her nest. The immense quantities of eggs of these, and various other birds that may be collected in the season, is truly extraordinary. I have sometimes been obliged to pick my way, to prevent crushing them with my feet. A variety of ducks are to be found in all parts, in the greatest abundance. I have myself killed eight or nine different species of them; the teal, however, is most delicate. Snipes also are found in great plenty; both the gigantic and full snipe, some of which we killed weighing a pound. Plover, dottrell, oyster-catchers, and a great variety of the gull tribe, of various and diversified plumage, are plentiful. The birds of prey are both numerous and voracious, particularly the carancho, which has much the resemblance in body to a large English crow, with the beak and talons of an eagle. I have frequently had my game, such as snipe, teal, &c., stolen from me by these cunning birds, after shooting them. One rascal stole my lucifer match-box, whilst I was blowing up a newly-lighted fire, and quietly perched within a hundred yards picking it to pieces. A better exemplification of their cunning cannot be given than the following instance, which I myself observed: a stupid upland goose was quietly sitting on her nest, surrounded by several of this reprobate crew, one of them hovering close over her, and the rest picking and teasing her; at length, her patience being exhausted, she rushed off her nest at the most daring. Another, however, immediately dropped into her nest, and seized an egg in his talons, and flew off, accompanied by his confederate, whom he allowed to share in the plunder. We were always accompanied on our shooting excursions by several of these birds. They would sometimes, when pressed with hunger, hover over our heads within two feet, and absolutely try to settle on the dogs' backs. I have frequently impaled them with a boarding-pike. The penguin lives principally on the Tussock Islands, where he burrows. I perfectly remember the impression made on me, one calm night, when at anchor between two of these islands in Choiseul Sound, by the extraordinary noise made by the braying of some hundred thousand of these animals. It is incredible the noise they made, which, when softened by distance, was very pleasing. I hardly like to state, but it really was the case, that although a quarter of a mile from the shore, we could not converse without raising our voice. \* \* \* These, with shags, curlews, some beautiful varieties of the dove, and a few land species, are the principal birds of the Falklands."

Mr. Mackinnon gives some entertaining accounts of their sporting enterprises, which are of so novel a kind that we extract one for the amusement of our Nimrods:—

"The following affray took place in an endeavour to procure some mess beef. Came-to, and whilst mooring observed a fine herd of cattle grazing on a peninsula called Bincon del Toro, or the Bull-ring. Eight of us, including Mr. Sullivan, commander, his brother, and myself, immediately started in chase. We pulled in our boat up to the first isthmus, but just in time to see the rear-guard of bulls tearing over. As we knew of another pass two miles inland, the whole party moved silently along to cut them off; as, luckily, we crossed their tracks and got the wind of them, by taking advantage of the ground we arrived

there before them. A few minutes afterwards their vanguard, consisting of ten or twelve bulls, came trotting up; but seeing our bold front, they made a full stop, bellowing loudly, and tearing up the ground with their horns; immediately after up came the main body, consisting, as well as we could see (it being now nearly dark) of about fifty cows, heifers, and calves. With a loud cheer, in a line, we advanced. The cows and calves took the alarm, and fled back towards the first isthmus; the bulls gave ground by little and little, and on our quickening our charge, turned tail and followed the cows. It was then 'the devil take the hindmost,' and who should have the honour of putting the first ball in our Christmas dinner; every one, therefore, put his best foot foremost. The excitement was tremendous; we could plainly hear the bellowing and roaring of the infuriated brutes. We gained the top of an eminence with an abrupt fall,—over it at speed. It was deeper than I expected: my right foot lodged on the side of a stone, which turned me quite over, sprained my ankle dreadfully, and my head coming in contact with a stone, spread me out for a few minutes perfectly insensible. I shall now proceed with the other party, who, not perceiving my accident, except the last person, who fell over me, and remained as a protection, thinking I was much hurt. On they went with unabated speed, our commander leading the van. La Porte (the dog) suddenly seized a fine calf by the nose, which encumbered him so as to enable Mr. Sullivan to catch him round the neck; the strong little beast, however, dragged them both away so quick, as to make it a matter of some difficulty for a man to come up behind and hamstringing, and thus secure it. A fine cow, I suppose the mamma of this calf, became perfectly infuriated by the bleatings of its innocent, and charged about like a mad thing; three shots struck her, beside two balls from Mr. Sullivan's gun, who, thinking she must be done, drew his double-barrelled pistol, and gave her the right-hand barrel; the moment she felt the smart of the bullet she threw off the dog and charged him furiously; when within five yards he discharged the other barrel into her head, and, as we afterwards found, the ball had entered between her eyes—a cool and good shot, in such a predicament. This, however, availed him not, or affected the furious beast a jot, as she knocked his gun out of his hand, and, most providentially, her forehead struck him a tremendous blow on the chest (her horns being on each side of his body), tore the ground up on each side, and then passed on, her hind hoofs trampling on his body. She turned, and was coming up again, when his brother, in the strength of fraternal affection, marched deliberately up, put his musket within a foot of her body, and blew her heart to pieces. Mr. Sullivan was very severely shaken by the blow he got, and his hands were much cut. In the meantime, after a few minutes of insensibility from the blow I received, I came to, and attempted to rise, but fell over again in agony as my foot touched the ground. Just at this moment we saw the flashes, and heard the shouts of the above-related battle; this was not to be borne, so, slinging my rifle, and putting my arms round my companion's neck, by dint of hopping, we approached the battle-ground as fast as possible in this state. We had not proceeded far before we were stopped by a most diabolical outcry, and, to our inexpressible fright, found that the body of the herd had turned, and were coming upon us

screaming and galloping like mad. It was too late to run, even had I been able, so down we lay, taking the chance of being run over rather than be gored to death; the noise increased with the rapidity of their approach; I never was in such a fright in all my life: on they came, all mixed together, plunging and bellowing, passing, like a whirlwind, within ten feet of our concealment. Human nature could not stand this; as if with one accord, my companion's musket and my rifle sent their contents into the centre of them, but without any visible effect. We were joined soon after by Mr. Sullivan and his party, who was able to walk home, although much shaken. Not so with me; I was carried home on the men's shoulders with as much care and attention as a sick lady. On getting back to our boat, we found a formidable division of small-arm men just landed, to look for us, it being nearly midnight."

The conflicts with sea-elephants and sea-lions were not less perilous; but we must leave these exploits to say that the fisheries are most abundant, and might be carried on to a prodigious and profitable extent. With regard to the essential article of fuel, our author notices:—

"The coast of America adjacent to these islands being covered with wood, would afford great facility to steamers for a supply of fuel in any quantity. With four men in one day I cut sufficient peat for a month's consumption; four or five sunny days are sufficient to dry it thoroughly; it is then fit to stack for use. Captain Fitz-Roy says, 'The want of wood in these islands would be a serious inconvenience, but its deficiency is thus amply supplied, which answers every purpose. It will not, however, answer for a forge in its natural state; but if, by a mechanical process, it could be pressed hard for some time before it was used, it would afford a much greater heat.' Weddel, in his voyage, states, 'that by working the peat-holes alternately, a sufficient quantity can always be procured.'"

And he adds, in a note:—

"*Compressed Peat Fuel*.—So long ago as 1836," says the *Literary Gazette*, "we called the public attention to the experiments carried on by Lord Willoughby de Eresby, for the compression of peat into a fuel, which should answer all the purposes of coal, in agriculture and manufactures, and become an article of immeasurable importance in vast sterile tracks of country, where the latter prolific source of industry and wealth could not be obtained. In 1837, we noticed the progressive success which had attended these operations, and in the present year reviewed a statement, published by the noble lord, in which he detailed the course of his trials, alterations, and improvements, till he had reached the reward of his patriotic labours, by perfecting a machine, and process of compression, fully adequate to the object he had so indefatigably and ingeniously pursued," &c. &c."

No doubt the remedy is most ready and efficient. We conclude with the great gist of the whole statement, after recapitulating the key possessions which Britain holds throughout the habitable globe.

"Without dwelling longer on the advantages arising from these several stations already mentioned, let us turn our eyes towards the continent of Australia, now boldly erecting its front, and rising into civilisation and importance in a manner hitherto unexampled! Let us look also at the vast extent of territory, and at the mighty states that line the waters of the

Pacific Ocean. What is the intermediate spot between Great Britain and Australia and New Zealand, which forms a half-way house for the trade which is hourly increasing by the intercourse of the two countries, and rising into one of great national consequence? The Falkland Islands! Where is the spot which commands the passage round Cape Horn and the Straits of Magellan, and consequently that point which, as the trade with the Pacific increases, arising from a natural course of events which will take place, and which, consequently, must be of great importance to the interests of Britain? The Falkland Islands! Taken, therefore, as the pivot of the trade between the great and isolated continent of Australia on the one hand, and of the immense regions washed by the waters of the Pacific on the other, the Falkland Islands will become at no distant period the key to the commerce of those distant shores, and the Gibraltar of the Pacific and of the Australian seas. Such, in a commercial point of view, may be at some future, though not very distant period, the benefit derivable to Britain from the possession of the Falklands."

Mr. M. proceeds to shew that, in the event of a war either in the old or new world, they would be no less important, and he observes:—

"The situation of the Falklands is such that it may both assist our trade and check that of other nations, in case of hostilities, even under the supposition (a supposition which I trust may not be realised for ages to come), that our colonies in Australia were desirous of separating themselves from the mother country, their vicinity to the Falklands would induce them, even if they had no connexion with the mother country, to procure what they required, either for luxury or convenience, at a dépôt of British manufactures established so near and so handy for their convenience. If, therefore, we consider this cluster of islands either as pivots for trade, and as a locale to promote commercial enterprise in times of peace, or as stations and dépôts for provisions and convalescence in time of war, or in any other point of view they are considered, they cannot but revive a feeling of that interest in the people of Britain which existed last century. Speaking as an Englishman, I cannot but feel proud and gratified in seeing the flag of my nation—that flag which has for a thousand years braved the battle and the breeze—wave triumphantly on every commanding point in every quarter of the globe, in every port promoting commerce, freedom of intercourse, civilisation, and the freedom and happiness of mankind. Long may this continue! Perhaps the present century may witness steamboats plying between the Falklands and the coast of Patagonia and the Straits of Magellan; the whole of Patagonia may be explored, and the continental population redeemed from that state of barbarism and wretchedness which in other places is fast melting before the warmth of civilisation, of Christianity, and of individual happiness and national prosperity."

Amen.

*The Saucy Jack, and the Indianman.* By a Blue Jacket. 2 vols. post 8vo. London, 1840. Bentley.

THOUGH the press has of late years teemed with nautical romances and tales of the sea, the public taste for this species of writing, when really good, appears to be undiminished. The stories before us are evidently leaves from the life-book of a sailor; and the freshness of style, and simplicity of narrative, form an agreeable change to the more wondrous accounts of "hair-breadth 'scapes," and all

other kinds of perils: not that these volumes are deficient in exciting scenes, for there are accounts of battles, and storms, and wrecks, sufficient to satisfy any moderate appetite. The first tale, *The Saucy Jack*, is in our opinion the best of the two, though *The Indianman* has also considerable merit. *The Saucy Jack* contains passages in the first voyage of a runaway boy, who fixes on what he terms "a nice ship," but which turns out to be a privateer, bound for the Spanish Main. We shall not meddle with the details of the story, but quote a few passages in illustration of the author's mode of spinning very genuine and entertaining yarns:—

"A bumboat woman is generally a character; and to be a genuine species of her tribe she should not weigh less than fourteen stone: the nearer she approaches to sixteen, the greater her originality. She has been a fresh-coloured pretty girl, with good teeth, much chat, and more assurance, and has in her time captivated the heart of more than one officer; this she knows well how to turn to her own advantage. The remains of beauty are still to be seen in her complexion and good-humoured face, which is generally improved by the effects of the sea breeze. Her boat is small, and her stock of goods entirely fills it; indeed, when the weather is squally, some extra management is necessary before leaving the shore.

"It is then quite necessary that the fat fair one should first occupy her place in the boat, which naturally becomes considerably by the stern: to counterbalance this, a cask of porter is stowed away forward, to bring the boat, as it is intended to do the purchasers, by the head; then the joints of meat, loaves of bread, and other good things, are packed near their mistress, and made all snug, to be in perfect trim when the waterman has taken his seat. Thus arranged, she contrives to be on board every morning before eight o'clock, at which time the ship's company have need of her wares to assist furnishing their breakfast. To be mistress of her art, she ought to be as perfect as Cramer or Braham in the knowledge of flats and sharps, and have a capital ear for music in the sound of a guinea; liberal when she is sure of being profitably repaid, cold as charity when that desirable end is in any way doubtful. She should have a smile like a cherubim, and an eye like a hawk, to enable her to look into the heart of the party she is about to trust, yet be able to give tick with a good grace and affability of manner, so as to make you believe all reasonable doubt of you is a stranger to her soul. All these qualities will not constitute perfection unless she be well skilled in the contraband trade, and can smuggle spirits on board for the sailors, and cigars and silks on shore for the officers."

A merry little scene observed at Portsmouth Fair:—

"That which tickled my fancy the most was observing an old quarter-master, who had grown grey in the service of his country, nearly out of his wits for joy at his good fortune, or something else, in being about to break a bank kept by a woman who had a box full of dolls, which were numbered on the crowns of their heads; the old fellow had found the right string, and almost every time he pulled number fifty appeared, to the dismay of the female and rapture of the old sailor, who expressed his delight by a loud laugh intermixed with oaths. His jacket-pockets were crammed full with nasty little gingerbread nuts, yet he was not content, for he continued playing and distri-

buting his gains to the children assembled round him, who answered his generosity by repeated cheers; and each time the largest number came to his share, he pulled off his hat and joined them in the shout: when I left him he was in the height of ecstasy."

A good reason.—"I beg pardon for interrupting you," said Grafton; "but tell me, Winstanley, since you are so fond of quoting Latin, where the devil did you pick it up?" "Confound your nonsense!" replied Winstanley; "your question is easily answered:—my father lived in the same street with a Roman Catholic priest." "That accounts for it at once," said Grafton."

From *The Indianman* we shall take a single extract; it is an old boatswain's account of how he came to be married:—

"You must know, then, that about twenty years ago, one summer afternoon, I was a walking along the High Street, at Chatham, when I saw a young woman, whom I had before known something about, clap her helm a starboard, and come to an anchor in a cook's shop. This young creature was formed in the beautifullest manner; from stem to stern she was all alike; her cemetery was beautiful to beholders.—'Symmetry, perhaps, you mean, Mr. Swallowtail?' interrupted the captain. 'Very likely, sir; I am sure I don't know,' said the boatswain; 'I an't much of a scholar, and can't be expected to have so much book-wisdom as our doctor: why, bless your soul, sir, he is past all books—books are of no use to him. Well, then, sir, symmetry, since you like it best; her run was uncommon fine. Seeing as how I brought up right athwart her hawse, so as she couldn't clear me on either tack, when she got under way, she gave me a look which went to my very vitals; I don't mean the ham and beef that was in the window of the shop, nor those Betsy was a buying which the woman was cutting with a large knife; but I mean the place where our feelings is—you know, sir. Betsy got under way, and I made sail in chase; she hauled her wind close round the blue post at the corner of the Chest Arms public-house, and slap she orders a pot of porter. Now, thinks I, here's to be even with you, my dear; so I ordered a bottle of rum, paid for it, and put it in my coat-pocket. When Betsy saw me so liberal-like, she smiled on me so sweetly it would have thawed the North Pole; so my heart gave way, and I spoke to her. 'Miss Elizabeth,' said I, 'don't you think a pound of beef and a pot of porter too much for one solitary individual?' 'No doubt of it, sir,' said she. 'Don't you think that the addition of my company, and a bottle of rum, will make the afternoon pass more pleasanter?' 'No doubt of it, sir,' said she; so I took her at her word. We ate the beef, and drank the beer, and were just at the finish of the rum, when I seized her slipper, and, kissing it, said, in the fulness of my heart, 'Betsy, will you marry me?' 'No doubt of it, sir,' said she; and so it was a match."

With this we shall conclude; our selections are short but pithy, and will be but a slice from a very amusing loaf. To the public we recommend a cruise in *The Saucy Jack* or *The Indianman*; the author's friends will be certain to take a trip, and a very pleasant one it is sure to be.

*The Real and the Ideal; or, Illustrations of Travel.* 2 vols. 12mo. London, 1840. Saunders and Otley.

We hardly know what to say of this produc-

tion; it is such a mixture of information and romanticism—of information possessed rather than communicated, and of romanticism which runs into an affectation of language, and an indefiniteness of meaning that offends the taste and perplexes the judgment. There is also so strange a medley of subjects, under such extraordinary heads or titles, that we ever find ourselves in a labyrinth, and wonder more and more whither the next turning will bring us. Thus "Flights to Florence" treats of all the principal cities in the north of Italy, of the arts and literature, of Ariosto, Tasso, Dante, Petrarca, Boccaccio, Machiavelli, Guiccardini, Metastasio, Goldoni, Carlo Dolci, Correggio, Michael Angelo, Cellini, Galileo, Salvator Rosa, Filicaja, Alfieri, Pindemonte, Ugo Foscolo, Pellico, Bernini, Borromini, Carlo Maderno, Pygmalion, Louis XII., Lucrece Borgia, Theodorico the Goth, Leonardo da Vinci, Perugino, Raphael, Guido, Livy, Virgil, Brutus, Cassius, King Lear, Shakspeare, Romeo, Juliet, Borromeo, Ceno de Pistoia, Vicinia, Landini, Visconti, Hallam, Sismondi, Orpheus, Euridice, Rienzi, Cardinal Bembo, Justinian, Belisarius, Narses, Robert Guiscard, Ossian, Homer, Milton, Giorgione, Dominichino, the Caracci, Zoppo, Chendi, Cavedone, Schidone, Bandinelli, D. de Voterra, Spagnoletto, Caravaggio, Tempesta, Calabrese, the Pisani, Giotto, Brunelleschi, Alberti, Ghiberti, Grosse, Francis I., Louis Sforza, Charles V., Albano, Guercino, &c. &c. &c., all in most admired disorder, and within the space of forty-eight pages. That the matter is commensurate with the manner, a single extract may suffice to shew:—

"Parma is peopled with the creations of Correggio; and what pictures in all Italy excite more lively sensations than his St. Girolamo, and Flight into Egypt? The lovely Magdalene in the one, with her head on the lap of the infant Saviour, her tresses run through by the fingers of one hand; whilst with the other he points to the book held before him by the angels, seated on the knees of his mother, and overlooked by St. Joseph. What more happy-looking party in the other, when the Saviour, holding by his father and mother, they march into Egypt, conducted by the angel; the Virgin looks full of peaceful assurance, all joy, simplicity, and sweetness. Another mother exists, sovereign of Parma, who, like a virgin chosen to incarnate a god, was made the wife of an emperor; who, in his short career, was a Jupiter upon earth; and after producing an only son and child, she likewise had a family by a man. This son born, the purpose for which he was brought into the world ceased to be. Named king of Rome, an ill-omen, he seemed to have inherited its ruins and fall of empire; and his palace at Paris, commenced at his birth and unfinished, remained as the monument of his half-formed and abortive hopes. His family dispersed were like the flight into Egypt; but disunited, and with no heavenly guide, they returned to no promised land. He was heir only to the prison of his father, his last estate; and though not destroyed like the infants of ambitious prospects by Herod, yet confined on the same account, he consummated together the first and second persecution of our Saviour, by enduring the slow protracted poison of captivity, till he expired under the torture."

We cite a parallel passage from "Hovering over Rome:"—

"The palace of the Austrian ambassador, built from the bricks of the Colosseum, and called the Palace of Venice, is the largest in

Rome, and suitably held by the power which represents the barbarians who overturned the ancient city and empire, has now subjected the Adriatic queen, and raised its present authority, like this house, on the ruins of Italy. Its Ghibellin and imperial sway has extended, like the building now towering over the smaller abode opposite, of Napoleon's mother; as if to shew what were the present dimensions of the German and French empire. The latter, which began in all the vigour of masculine youth, ended in the decrepitude of an old woman. Mme. Letitia was an equal almost to Rome, for she had given birth to an empire in a son, whose life achieved it, yet left her to perish, bereft of it, like the ruins of Rome. At the foot of the Capitol to expiate the incarnation of such a fantasy as universal empire, with Rienzi, who had conceived in his brain the restoration of the republic. The mother of our Saviour heard all the flattering promises of her son, and saw them all fail on the crucifix of torture, where with felons he was attached; but the mother of Napoleon saw them all realised in her offspring, to be extinguished in the ocean cage, where her son was suspended a prisoner and expired: the one was afterwards comforted with the true interpretation of the Messiah's career, the progress of his principles, the accession of followers to his faith, and the spread of his spiritual kingdom; but the other lived to see every hope vanish—which was the worst lot? Mater Dolorosa both may be called, worshipped alike in the Mater Dolorosa of cities. Mother of princes, she was the Niobe in Byron's Niobe of nations; she saw all her children struck by the avenger of impious daring, and outlived them. She was the lingering victim of the vicissitudes of fortune. Rienzi was the other puppet of her tricks, and more abrupt and violently were pulled the strings of his circumstances and fate: he established a government, like the monuments about him, which he quoted, but a ruin of antiquity, dressed up an imitation, played and frightened people with the ghost of Rome, till his own colleagues, ashamed of the mockery, slayed him a victim at the foot of the Capitol. The Gracchi, slain within and on the top, received the crown of political martyrdom, marking the distance and the difference between the ancient and modern patriot."

Observation upon writing of this kind is unnecessary.

These "Flights," well may they be so called, are followed by "Flittings in Florence," after the same fashion and in the same style; then come the "Traverse of Tuscany," "Hovering over Rome," "Hootings in the Colosseum," "Perching on St. Peter's," and the whole concluding, not out of keeping, with "Pantomime!" The chapter on the Apollo Belvidere is chiefly filled with an inquiry into the personal appearance of Jesus Christ. But we have done enough to indicate the character of this work, which, if ever publication did, does treat *totidem rebus et quibusdam aliis* in the most singular and desultory way that can by possibility be imagined.

*Stage Effect; or, the Principles which Command Dramatic Success in the Theatre.* By Edward Mayhew. Pp. 103. London, 1840. Mitchell.

MR. MAYHEW is strongly opposed to the theatrical patent monopoly, and the system of management which springs from it. In his observations upon other topics connected with the stage there is great discrimination and justice. Situations he rightly condemns as *principals* in the construction of the genuine

drama, though he acknowledges them as occasionally striking stage effects. The account of, and remarks on, scenery, dresses, properties, &c., are also very judicious. We offer a few of the concluding passages, as a specimen of the talent with which the whole is argued:—

"Looking from authors to actors; it is much to be lamented that the system, formerly prevalent, of these gentlemen remaining long in their engagements, forming, as it were, the families of different theatres, is now wholly broken up. Then they became familiarised with each other's styles, and the effect of their performances were not a little benefited by the tone this gave to the picture. Nor is the loss lessened by the method of conducting rehearsals at present. 'The business of the stage' is gone through; the actors are made to understand their respective positions, and the movements of those with whom they are to appear; but 'the words' are hurried over. The prompter holds the book, while they say a lesson. How the passionate passages are to be delivered cannot be guessed at. The consequence is, that the first night of a piece, when the author has all at stake, is, in truth, the first rehearsal. Many nights must pass before the actors can become sufficiently sure of their own intentions to be able to study the manner of those who are with them in the scene, and harmonise their styles for the general effect. There are exceptions to this remark, and they are the gentlemen who have been schooled in better days, and who are now the supports of their profession."

#### MISCELLANEOUS.

*The Effects of Literature upon the Moral Character.* By J. G. Dowling, M.A. Rector of St. Mary de Crypt, Gloucester. Pp. 52. London, 1840. Rivingtons.

THIS was a lecture delivered at the Gloucester Literary and Scientific Association, and with some sound, takes, we think, some narrow and unfavourable, views of the moral effects of literary cultivation. We are not sure that an ill-conducted education may not be worse than no education at all; but we cannot go the length of the reverend gentleman, that the mind must be cultivated in a superior manner in order to produce any good fruits, and, in short, nothing but evil. Even the dissipation of reading—an idle object if you please to call it so—is more likely to do good than harm, and to keep the reader out of harm's way. It is true that religion alone can improve and elevate humanity to what we require, but too much severity of study would mar what it was meant to make; and there are a number of places short on the road where both pleasure and advantage can be safely derived.

*History of Jim Crow.* By John Briggs. 12mo. pp. 321. London, 1840. Smallfield and Son.

WE expected something different from the title; but this volume, instead of any allusion to the renowned dramatic character whose name it bears, is an exposition of the insults and injuries to which the black population in the United States must submit, whether they remain in the condition of slaves, or emancipate themselves by their prudence and good conduct. We presume it affords a correct view of the society among which it mingles in the slave states and new settlements; at any rate, it seems to relate simple though curious circumstances, without high colouring or exaggeration.

*The Theory and Practice of Book-keeping Illustrated and Simplified.* By B. F. Foster, author of "The Merchant's Manual," &c. 4to. pp. 112. London, 1840. Souter.

In one sense few persons could be so competent to comment on the theory and practice of book-keeping as we, for our library bears witness to the perfection of the system by hundreds of vacancies, and the proofs of many an entry having been made by adepts in the science. But in the sense of this publication, all we are prepared to say is that it appears to us to simplify many of the needless involutions and intricacies which belong to plans of keeping accounts, and that, if clearly followed out, it would prevent many mistakes, and often ruinous calculations.

*American Slavery as it is. Testimony of a Thousand Witnesses.* 8vo. pp. 224, double cols. (New York).—Published by the Anti-Slavery Society, and a collection of thousands of acts of oppression and cruelty, perpetrated by, or alleged against, slave-owners in the Southern States. Many of these acts are so atrocious, that human nature recoils at the belief in their reality; but still enough, we fear, must be true to impress us with the conviction that man is not to be trusted with despotic power over his fellow-man.

*Ruins of Ancient Cities, with General and Particular Accounts of their Rise, Fall, and present Condition.* by Charles Bucke. 2 vols. LXX. and LXXI. of "Family Library." (London, Tegg).—Mr. Bucke has in these volumes put very fairly together the information found in many authors respecting celebrated cities of antiquity, the remains, and in some cases only the traditions of which, are found in various countries of Europe, Asia, and Africa. In alphabetic order, from Abydos to Vei, there are accounts of ninety-four such places and sites; and the whole may be read with advantage, not only with reference to the precise subjects, but to the ancient histories with which they are so intimately connected.

*The Juvenile Historical Library, adapted for Youth, Schools, and Families, &c.* by Miss Julia Corner. Part I. Vol. I.: France. Pp. 98. (London, Dean and Munday).—Miss Julia Corner proposes to give in this manner the history of every civilised nation in the world, and we can justly say, that if all is executed in the same clear and simple manner as this first portion of the history of France, the rising generation will owe her gratitude. With two or three slight inaccuracies, or rather grounds for misapprehension from indistinctness of expression, the leading events are well stated, and a very correct idea is given of the origin and progress of the nation. A neat engraving of the coronation of Charles VII. with the Maid of Orleans in attendance, embellishes the part.

*Bacchus. An Essay on the Nature, Causes, Effects, and Cure, of Intemperance.* by R. B. Grindrod. Pp. 534. (London, Pasco).—False colours—a false title; as if pretending to be tipsy would get folks to listen to a lecture on temperance! We are really so offended with the misuse of the name of the Jolly Bacchus, that we will not praise the well-meant effort of the writer to recommend less ardent worship of his rites.

## ARTS AND SCIENCES.

### GEOLOGICAL SOCIETY.

JAN. 22. Rev. Prof. Buckland, D.D. President, in the chair.—A paper, by Mr. Lyell, was read, 'On the Boulder Formation, or Drift and Associated Fresh-water Deposits, composing the Mud Cliffs of Eastern Norfolk.' The line of coast described in this memoir extends from Hasborough to near Weybourne, west of Cromer, a distance of twenty miles, and was examined by Mr. Lyell in 1829 and 1839. The formations composing the cliffs are not exhibited in regular succession in any one vertical section; but they consist of chalk, Norwich crag, fresh-water deposits, drift mud and sand, stratified and unstratified, occupying the great mass of the cliffs, in some places 400 feet high, and superficial accumulations of flint gravel. The point where the order of succession may be best studied is the neighbourhood of Cromer; but the peculiarities of each deposit are better exhibited at detached points, and it is only by a careful examination of the whole line of coast, and a combining of the features which it presents throughout its range,

that the observer is able to arrive at just conclusions respecting its geological structure. In addition, moreover, to the interest connected with the origin and mode of accumulation of the drift, one of the most recent deposits of England—perhaps no other part of our island—exhibits evidences of disturbances on so great a scale, and of an equally modern date—for there are proofs in these cliffs of movements, both downward and upward, of strata several hundred feet thick for an extent of many miles; together with the most complicated bendings and foldings of the beds; also the intercalation of huge masses of chalk; and, what is no less perplexing and difficult of explanation, the superposition of contorted upon undisturbed strata. Mr. Lyell describes the structure of the cliffs as it is presented in proceeding from Hasborough to Weybourne: our limits, however, confine us to a general notice of the deposits, and the more striking physical phenomena. *Chalk.*—This formation appears occasionally on the shore below the mean level of the tide in horizontal strata; but near Trimmingham are three remarkable masses of chalk which protrude from the lower part of the cliffs, and may be occasionally seen to be continuous with the solid beds extending under the sea. The strata of which they consist, are, in some parts, highly inclined, and the layers of drift, or of sand, loam, clay, and gravel, in immediate contact with the masses, have a similar dip; but as the latter recede, they gradually assume the horizontal position. Mr. Lyell is of opinion, that both the chalk and the drift, at this point, have been subject to a common sudden or gradual movement; and that the resistance of the solid chalk may have produced the local derangement of the layers of drift. He is further of opinion, that the three masses probably belong to a nucleus of chalk in the hill behind the cliff, forming Trimmingham Beacon; as in Trimmingham, chalk was found in making a well, at the depth of only 120 feet, though the face of the cliff is calculated to be 400 feet high. At Overstrand, a little south of Cromer, is an extensive chalk-pit which presents considerable dislocations, and the irregularities in the outline of the solid but inclined strata, are filled with alternating beds of chalk-rubble and gravel, also highly inclined. The cliff along the shore, in front of Overstrand, is composed entirely of drift; but if the progress of destruction continues, it will in time present a face consisting solely of chalk. Near Cromer, and to the north of the town, the drift includes a large quantity of chalk-rubble, and huge fragments of chalk are sometimes intercalated in a most singular manner, being wrapped round by layers of sand and clay; but chalk *in situ* is observable in many instances, at a short distance inland, and the gradual destruction of the cliffs has proved that the nuclei are only portions of larger masses which may be connected with the main body of the formation. About three quarters of a mile west of Sherringham is a remarkable mass of chalk. Upon approaching this point from the eastward, the horizontal beds of regularly stratified drift become suddenly vertical, and present a wall, eighty feet high, resting against a needle of chalk; beyond which is another vertical wall of drift, but of a different composition from that on the east side. A little further the beds first undulate, and then assume their nearly level position. The junction of the needle of chalk with the subjacent horizontal beds of the same formation on the shore is not visible; but Mr. Lyell is of opinion that there is no connexion. The appearances presented at this locality, and generally along

the whole line of coast, vary annually; and the more essential differences noticed by Mr. Lyell, during his second visit, are detailed in the memoir. Other masses or protuberances of chalk occur between Cromer and Lower Runton, and at Upper Runton; and near Cliff-end, Weybourne, the fundamental chalk rises above the level of the shore, presenting a waved outline, and is covered by a bed of flints, mixed with some crag-shells. *Norwich Crag.*—This deposit is exhibited *in situ*, at very low tides, near Cromer, resting upon chalk, and forming a bed about two feet thick. In the cliffs between Holdhigh Gap and Weybourne, it attains a thickness of several feet; and at the extreme end of the cliff, near Weybourne, its strata, consisting of sand and gravel, have been bent into an arch. At all these places it contains characteristic fossils. Fragments of crag-shells occur in the drift in many places along the cliffs between Hasborough and Weybourne, and have evidently been derived from the destruction of that formation. Mr. Lyell is also of opinion, that many of the mammalian remains found on the coast may be ascribed to a similar origin. *Fresh-water Deposits and Beds of Lignite, with Subterranean Forests.*—The principal locality for the lignite accumulation and associated forest is Hasborough. In 1829, the section presented at this point consisted, in descending order, of sand and loam, thirteen feet; till or unstratified clay, eight to sixteen feet; laminated sand and clay, eighteen inches; the clay being partly bituminous and enclosing compressed branches and leaves. At low water there are also exhibited extensive remains of a submerged forest, the stools of the trees being imbedded in peat, in which have also been found fir-cones, and the remains of the elephant, rhinoceros, hippopotamus, horse, ox, and deer. The oyster-bed discovered off this part of the coast in 1820 has been long celebrated for the teeth and bones of the elephant and other mammalia which have been dredged up. A similar bed of lignite, enclosing remains of the elephant, was exposed at Woolcot Gap during the winter of 1838-1839: and Mr. Lyell ascertained that a mass of drift, thirty feet thick, must have been removed by the waves before the bed could have been laid bare. Stools of trees have been seen by Mr. Simons, of Cromer, below the cliffs eastward of that town, and on the beach opposite Sidestrand, imbedded in blue clay; which in the former case, at one point, rests upon Norwich crag, and in the latter, on chalk. Shells have been found beneath the roots of the trees; but Mr. Lyell has not been able to obtain specimens for examination. Remains of forests occur at other points along the line of coast. From these facts it is evident that the chalk, covered, partially at least, with Norwich crag, was over-spread with layers of sand and clay, the surface of which was subsequently converted into dry land, on which forest-trees grew, and that these were afterwards submerged and gradually buried beneath the great accumulations of drifted materials composing the cliffs. The fresh-water strata are well exhibited at Mundesley, extending horizontally for several hundred yards, and forming the mass of the cliff, from twenty to thirty feet high, with the exception of a capping of gravel. They consist of irregular layers of brown, black, or grey sand and loam, mixed with vegetable matter, and sometimes passing into a kind of peat containing much pyrites. In 1829, a mass of the ordinary unstratified clay of the cliff projected into the fresh-water beds, in such a manner as to imply contemporaneous origin

\* Thus we are told that the Romans made some amends to the Gauls for depriving them of liberty, by instructing them in the Christian religion; a very questionable way of relating a very incomplete fact.

to the lower part, at least, of both formations; and Mr. Lyell is of opinion, that a small river probably flowed at this point and prevented the accumulation of the drift of the cliffs, but deposited the sediment with which its own waters were charged. The paper contains a list of eleven species of fluviatile testacea obtained by various collectors, only two of which have not been identified with British shells: also, a notice of the remains of insects procured from the same beds, and determined by Mr. Curtis to belong to English living species. The scales and other portions of fishes found at Mundesley have been examined by the Rev. Leonard Jenyns and Mr. Yarrell, and ascertained to be referable to perch, carp, pike, and trout, but not all identical with fishes inhabiting the waters of our island. Among the vegetable remains, the best preserved have been proved by Mr. R. Brown to be the seed-vessels of *Ceratophyllum demersum*. At the base of the cliff near Sidestrand, unios have been found abundantly; and at West Runton Gap, between Cromer and Weybourne, fresh-water accumulations occur unquestionably under the drift forming the cliffs, and containing fresh-water shells: all of which, with the exception of perhaps two species, still exist in a living state in England. From the position of these fluviatile or lacustrine deposits, the one at Runton being entirely below the drift, and that at Mundesley partly above it; Mr. Lyell is convinced, that all the mud cliffs, including the fresh-water beds, belong to one period, the relative age of which, as determined by the shells (two being supposed to be extinct), is that of the newest tertiary. With respect to the mammalian remains, no accurate inference can be drawn of the age of the deposit in which they are found, as it is probable that many of them may have been derived originally from denuded beds of Norwich crag, and enclosed either in the mud cliffs or the layers of peat connected with the submerged forests. *Drift*.—This formation, which constitutes the greater portion of the cliffs, Mr. Lyell says, is strictly analogous in character to that which has been called the "boulder formation" in Denmark and Sweden, and is so remarkable a feature in the superficial geology of Scandinavia, and the countries extending from the shores of the Baltic to the borders of Holland. Throughout this extensive tract, as well as in Norfolk, it is characterised by containing erratic blocks of granite, porphyry, gneiss, and other rocks, but their number and dimensions decrease on proceeding from north to south. Mr. Lyell is of opinion, that this great formation was accumulated almost exclusively on land permanently submerged, and not by one or many transient rushes of water over land which had previously emerged; he therefore proposes to substitute the term drift for diluvium, the name by which it has been hitherto generally designated. In Norfolk, and the other countries where it occurs, the formation consists of two descriptions of deposits; one composed of sand, loam, clay, and gravel regularly stratified, the other of masses of clay totally devoid of all lamination or subdivision into beds. The former Mr. Lyell calls "stratified drift," and the latter "till," a word employed in Scotland to express strictly analogous accumulations. Though the structure of each subdivision marks some peculiarity in its origin, yet the stratified drift and the till were in all districts formed contemporaneously, and in mineral composition they are often identical. The only deposits now in progress known to Mr. Lyell of precisely similar characters to the

till are the terminal moraines of glaciers; and as accumulations of the same nature must take place in those seas where drift ice, charged with mud, sand, gravel, and blocks, melts, and the dense matter is allowed to fall tranquilly to the bottom, so he is induced to infer, that the production of the till may have arisen from the earthy contents of drifted masses of ice. The occasional intercalation of a layer of stratified matter, he explains by the temporary action of currents during the melting of the icebergs. The "mud cliffs" commence at the light-houses near Hasbrough, and extend uninterruptedly to Weybourne, but vary in height from 15 to 400 feet: they are occasionally capped by a bed of gravel. The till and the stratified drift are irregularly associated—sometimes ranging in the same level, and sometimes alternating. They both contain blocks and pebbles of almost every variety of rock; and fossils, often beautifully preserved, derived from secondary strata; and fragments of Norwich crag-shells. The most curious phenomena presented by the cliffs are the complicated bendings and contortions of the strata, which are sometimes exhibited throughout the whole height of the cliff, but are sometimes of partial extent; and it not unfrequently happens that disturbed beds rest upon strata perfectly horizontal. In many instances, the layers are vertical; in others, they form concentric crusts around a nucleus of chalk, sand, or gravel, the diameter of the spheroid being occasionally 25, and in one case 50 feet; and these foldings, with every possible curvature and replication, are often associated within very limited distances. To account for such phenomena, Mr. Lyell admits, is extremely difficult; and he states, that no one mode of action can have produced the whole of them. Where the disturbed beds are in the immediate vicinity of protuberances of chalk, as at Trimmingham, he is of opinion that an upward movement probably produced the change of position in the beds of drift; and where the curved strata are associated with indications of partial subsidences, he admits that the effects possibly resulted from land-slips; and that such subsidings masses, moving over beds of chalk or drift, unoperated upon by the causes which set the superincumbent strata in motion, would, in some instances, explain the superposition of contorted, or curved, beds upon horizontal. To account, however, for the more complex phenomena of the coiled drift, he proposes an explanation, founded on the effects produced by drifting masses of ice in loose materials. During their recent discoveries in the Arctic regions, Messrs. Dease and Simpson observed that a long low spit, named Point Barrow, and composed of gravel and coarse sand, and in some places more than a quarter of a mile broad, was forced up, by the pressure of drifted masses of ice, into mounds, which assumed at a distance the appearance of huge boulder rocks; and so many instances have come to Mr. Lyell's knowledge of drifting ice moving forward loose materials, that he has no doubt of its power to produce many of the phenomena exhibited in the Norfolk cliffs. It is, moreover, throughout the boulder districts, that the species of disturbance in question is most prevalent. With respect to the masses of solid chalk inclosed in the drift, Mr. Lyell conceives that they may be accounted for by the action of the sea on the ancient surface of the chalk, before, or during, the deposition of the drift; and by which needles, or pinnacles of chalk, would be undermined, thrown down, and subsequently en-

veloped in drift. He also explains the accumulations of unmixed chalk-rubble, surrounded by sand, clay, and gravel, by considering them to be the talus of former chalk cliffs, buried up, at a later period, by drift or till. A portion of the transported blocks contained in the cliffs, Mr. Lyell believes, may have been brought into their present position by streams flowing from the westward; but he agrees with Dr. Mitchell in thinking, that some of them are possibly the *débris* of strata which once occupied the position of the German Ocean: the greater blocks he necessarily refers to the regions whence the masses of ice were floated, by which they were conveyed to their present position. Mr. Lyell, in the course of his paper, frequently mentions, in terms of commendation, the memoirs of Mr. R. C. Taylor and the late Mr. Woodward.

## ELECTRICAL SOCIETY.

TUESDAY, Jan. 21st.—Read, a paper 'On a New View of Electrical Action,' by Mr. Laming, communicated by the Secretary. M. M. Pouillet, Savary, and Becquerel, the author says, have been convinced, satisfied by experiments of the fact, that the natural tendency which bodies have to approach the earth is increased by electrifying them positively, and diminished by rendering them negatively electrical. The details of these experiments have been published in a memoir in French; to repeat them in the paper Mr. Laming considered would be unnecessarily to lengthen it, and he therefore assumed the fact as proved. He assumed also an attraction, operating among the atoms or particles of the electric fluid for one another, which he terms *idio-attraction*; and further, electricity to be attracted by the atoms of what is called ponderable matter, in such definite proportions as are represented by the several chemical equivalents or weights of these atoms. Be it remembered, however, that in the memoir the foregoing are established by a series of deductions based on data generally admitted by electricians of opposite opinions, and in strict conformity to the axioms of mechanical philosophy. Several copies have been transmitted to the Society, for their report upon the facts therein contained, and for distribution among the members. Mr. Laming believes that his deductions afford not only a competent cause for gravitation, but also satisfactory causes for the disturbance of the electrical equilibrium; the electrical conducting and insulating properties of bodies, and for many chemical phenomena, which may be circumstantially traced to result from electrical influence. His theory is based on the following principles:—1. "All the atoms of electricity attract one another, in a sphere of action indefinitely extended, with a comparatively feeble absolute force, which varies as the squares of the distances inversely. 2. Atoms of what is called ponderable matter attract atoms of electricity in large numbers, and in such definite proportions as are represented by their respective chemical equivalents, in a sphere of action indefinitely extended, and with a comparatively great, absolute force, which varies in some inverse ratio of the distance." To discuss the theory of the *idio-attraction* of electricity and its consequences, or even clearly to lay the author's views before our readers, would far exceed our limits. Some notion of it, however, may be derived from conceiving every atom of what is called ponderable matter to be a central nucleus to an atmosphere of electrical atoms, and this electrical atmosphere to have a

greater or less radius as the weight of the atom is greater or less. These electrical atoms form around each central nucleus, concentric strata, or spherical shells; and all the central nuclei gravitate towards one another, because they are connected to their respective electrical atmospheres, which attract each other. To the perfection or imperfection of these spherical shells, and to the number of electrical atoms forming the definite equivalents of the several central nuclei, are attributed all phenomena known as chemical and electrical; and also, as before stated, the cause of gravitation. As an experiment to prove that bodies tend to the earth with greater forces when positively, and with lesser when negatively, electrified, Mr. Laming suggests that a pendulum of a time-keeper should be made of a tube of glass of considerable calibre, capped with brass, and filled with discs of glass, armed on both sides with Leyden coatings, and lying flat one upon the other. If the under surface of the lowest plate be charged positively (the upper surface of the highest plate being uninsulated), the places of certain electrical atoms in each of the plates throughout the series will be virtually lowered, and if negatively will be raised. Then, if electricity do gravitate, the centre of gravity in the pendulum may be lowered or raised by these means, and accordingly a corresponding retardation or acceleration in the rate of its oscillation produced. The fact of the gravitation of electrical atoms is most important, and Mr. Laming asserts that it has been proved to the satisfaction of MM. Pouillet, Savary, and Becquerel, whose names stand high in authority on all points relating to electricity.

#### INSTITUTE OF BRITISH ARCHITECTS.

JANUARY 20th. An ordinary meeting of this Society was held, Mr. Edward Blore in the chair.—Several drawings in aid of the collection illustrative of the works of Inigo Jones were presented, as were also a magnificent work on the Pyramids of Egypt; a curious edition of Vitruvius, containing, in addition, views of all the temporary buildings and triumphal arches erected in Paris on the occasion of Napoleon's marriage with Maria Louise (particularly interesting at this moment); and several German books on art.—Mr. Godwin read a communication from Mr. Wilks, accompanying a copy of a work by M. Chevreul, "De la Loi du Contraste simultané des Couleurs," a subject to which the attention of the Institute has been specially directed. A suggestion was made by Mr. Donaldson, that foreign and expensive English works should be referred to certain members of the Society, in order that they might afterwards lay before the meeting a general outline of their contents and bearings.—A paper was read 'On the History of Græco-Russian Ecclesiastical Architecture,' by Herr Hallmann, of Hanover, illustrative also of the plan, arrangement, and decoration, of Græco-Russian churches. Christian churches were first erected in Russia at the beginning of the tenth century. From the year 981 to 1016, when Vladimir the Great was emperor, no less than 400 ecclesiastical edifices were raised; Greek artists being chiefly employed, not merely to design, but in the preparation of mosaics with which they were decorated. One of the chief peculiarities in the Russian-Greek church is the Iconostasis, or image-bearing screen, somewhat similar in arrangement to the altar-screen of some of our cathedrals; with this difference, that in the Russian church it is immediately before the

altar at the east end of the building, instead of behind it.

#### ROYAL INSTITUTION.

JAN. 24th.—First evening meeting of the season. Mr. Faraday 'On Voltaic Precipitations.'—Much increase to this interesting subject has recently manifested itself in the application of the depositions of the voltaic battery to taking copies of medals, &c. Professor Jacobi published in this country, in September of last year, through the medium of Mr. Faraday, in the "Philosophical Magazine," a description of a copy in relief of an engraved card-plate, which, doubtless, most of our scientific readers have seen; as also the pamphlet, published in October 1839, of Mr. Spencer, of Liverpool, who had been long previously practically working out the, in his case, original thought, and who has produced by his arrangements most accurate copies of medals. The process involves, to a high degree, the elements of perfection. As the little work is before the world, we need not enlarge; we may refer, however, our readers to our report of the Electrical Society, in *Lit. Gaz.* No. 1194, for the principle of the operation, and to the like in No. 1196, for the particulars of the production of the "metalochromes," which formed the second feature of the illustration. We need not say that the subject was rendered doubly attractive by Mr. Faraday's treatment of it, nor that his auditors were numerous.

#### PARIS LETTER.\*

Academy of Sciences, Jan. 22, 1840.

SITTING of Jan. 13.—Notice was given from the minister of war, that a commission had been appointed by him to inquire into the causes of the extreme prevalence of glanders among the horses of French cavalry regiments, as compared with those of other European powers; and that the result had been, that the bad accommodation and filth of the stables in most of the cavalry barracks, and the undue crowding of the horses, had been shewn to be the real causes of this dreadful malady. The minister had therefore decided on introducing the most extensive improvements, as far as they might be practicable, into all cavalry quarters. It was resolved that all new stables should be fifty feet wide, by eighteen high, and that four feet six inches should be allowed in width as standing room for each horse.—The secretary of the Academy, M. Arago, communicated some photographic representations of the principal buildings of Rome, made with the Daguerreotype by one of the workmen of M. Lerebours, the celebrated optician, sent thither for that purpose. M. Arago remarked that this was a proof of how little the apparatus in question stood in need of being invariably placed in the hands of a man of science. The views in question were very distinct and beautiful.—A discussion then followed on the presence of iodine in several saline springs in South America; a fact already known to the scientific world through the medium of some English travellers. It was recommended that some of the crystallised products of these springs should be brought to Europe.—A paper was read 'On some Hydraulic Wheels with Vertical Axles, commonly used in the North of Africa for Agricultural and Economical Purposes.' It was shewn that they were also well known, and in general use in many parts of

Provence and Languedoc.—Several papers were read on some rare cases of pathology.

SITTING of Jan. 20.—After some elections of officers had been gone through, M. Arago read to the Academy a very long paper of his own, 'On the Causes of the Scintillation of Stars.' He remarked that it was divisible partly into a change in the intensity of a star's light, and partly into a change in the colour of that light. The former fact had been noticed by Galileo: Kepler first observed the change of colour. M. Arago explained the phenomenon on the principle of interferences, comparing the different strata of the atmosphere, through which the stars' rays passed, to lenses of different densities and different refracting powers, which would, of course, greatly disturb and change the composition of the light received by the eye of the observer. It was known, he added, that in some parts of the world, such as in Persia, various localities in Asia Minor, &c., the stars did not scintillate. He also stated, that under certain circumstances the sun might be seen to scintillate.—The rest of the sitting was occupied with the reading of some medical and chirurgical memoirs, particularly one by Dr. Lugol, 'On the Extent and Nature of Hereditary Influence in the Propagation of the Scrofula.'

M. Alexander Brongniart has lately published "A Memoir on the Kallons and Argillaceous Substances Employed in the Making of Porcelain."—The Academy of Moral and Political Science is entirely absorbed with a contest for an election of officers, to which politics do not seem to be altogether strange; the well-known ultra-liberal deputy, M. de Cormenin, having been attempted to be excluded from the list of candidates. We have not heard of any papers of peculiar interest having been communicated to that body at its last sitting.—The new comet was observed at Paris on the 8th inst. at 5 A.M. for the first time, and has since been seen from the Observatory every morning that the weather permitted, close upon the horizon. On the 14th it was in the tail of the Serpent, near the star Eta: right ascension, 18h. 22m.; south declination, 4m. It is visible to the naked eye, but as it does not rise till 4½ A.M. it soon becomes lost to sight by the sun's rays.

M. Chevreul has just published a very important book on what he terms "The Law of the Simultaneous Contrast of Colours, and their Applications." This gentleman is professor of chemistry, as applied to colouring matters, at the great establishment of the Gobelins; and, proceeding on a profound knowledge of light and of all optical phenomena, he has arrived at many important discoveries, the fact of the existence of which was well known, in many instances at least, although their causes had never been developed. His law, in the present instance, he sums up in the following formula:—"In the case of the eye seeing at the same time two contiguous colours, they appear to it the most dissimilar possible, with regard to their optical composition and the intensity of their tone." This theory he bases on a great number of instances, and deduces from it many hints of immense importance to artists, and to all persons concerned in pattern-drawing, paper-staining, &c. He infers, for example, that the dead effect often arrived at in pictures by good colourists, arises from their eye having got so much affected by the contemplation of contrasted colours in juxtaposition, either in their own picture, or in what they are copying, that, so to speak, they no longer see true. This subject is highly worthy of the

\* Owing to the adverse weather, this letter did not reach us in time for our last No., and we have now to add another, from the same source, to its various and interesting intelligence.

examination of all chemists and optical observers.

M. Poisson, of the Academy of Science, is dangerously ill of apoplexy.—The new library at the Garden of Plants is now thrown open to the public.—A great improvement has been effected at the Bibliothèque du Roi, by warming all the rooms for the first time since its institution.—M. Bazin, lately appointed Professor of Vulgar Chinese, at the School of Living Oriental Languages, attached to the Bibliothèque du Roi, opened his course of public and gratuitous lectures to rather a numerous audience on the 20th inst.—A select portion of M. de Lamartine's works have just been translated into Spanish and published at Madrid.

Academy of Sciences, Paris, Jan. 28, 1840.

At the last sitting, M. Biot rectified an error which had been made in the geodesic survey, made some years ago at Clermont Ferrand, in Auvergne. He had been led to suspect the existence of an error by calculation, resulting from his theory of terrestrial refraction, and it had since been found that one of the mirrors used in the survey had been cited three feet above its real situation.—M. Arago communicated a paper from M. Hermann, of Berlin, 'On the Showers of Shooting Stars, observable about the 10th of August and 13th of November every year.' He considered them as asteroidic bodies revolving round the sun, and interposing themselves again every year in the first fortnights of February and May, between the earth and the sun. He thought that this would explain why at those latter periods the sun's light was often peculiarly enfeebled, and the temperature of the globe diminished—a phenomenon which, he states, is annually observable between the 7th and 12th of February, and 11th and 13th of May.

Academy of Moral and Political Sciences.—M. Berryat de St. Prix has been elected a member of this body; and Professor Hamilton of Edinburgh, a corresponding member.

A controversy is going on between two physiological botanists, as to whether dead leaves preserve a greater degree of heat than green and living ones. The ignorant in such matters assert that they are both cold.

An excellent translation of Lyell's "Elements of Geology," by Madame Meulien, under the inspection of M. Arago, has just appeared. The wood-cuts are, we believe, original.

M. H. Ternaux, who is one of the most deeply-read Spanish scholars of the present day, and possesses one of the most valuable private Spanish libraries in Europe, is going on with his publications of original and inedited documents, relative to the discovery and settlement of Southern and Central America by the Spaniards. He has lately sent through the press "A History of the Chichimeques, or Ancient Kings of Tezcuco," written by Don Fernando de Alva Ixtlilxochitl, never before published; and also a report, addressed to Philip II., about 1560, on "The Different Classes of Chiefs of New Spain," by Alonzo de Zurita. The first is a peculiarly valuable and interesting document, as shewing the state of Mexico at the time of the Spaniards' arrival, and the great extent to which they were indebted for their easy conquest to the internal divisions among the independent kings, whose united territories formed the federal empire of Mexico. The author was a descendant of that king, who acted the part of a traitor towards his country; and after he had been expelled from the throne of Tezcuco, and had subsequently compelled Montezuma to treat with him, took advantage

of the accidental landing of the Spaniards near Vera Cruz to lead them on to the destruction of the power of the Azteques. The light thrown by these publications upon the early antiquities of the western world is very great, and none but a person well versed in Spanish matters could have rescued them from oblivion.—The splendid work of Messrs. Champollion, on "The Palæography of the Latin Classics," should be in every large library. It is got up on a scale similar to the work of M. Silvestre, and contains numerous facsimile plates of the best MSS. in the Bibliothèque du Roi. There is much taste, and indeed a profound appreciation of art, displayed in many productions of a similar nature that have recently originated in France: the great numismatical and glyptical collection (well known in England, by the way) is a striking proof of this.—A new and careful edition has been published of the large work, so well known to medieval antiquarians, "The Complete History and the Costumes of all the Monastic Orders, Religions and Military, and of the Secular Congregation of either Sex," &c. by Father Helyot. Books of this kind, expensive as they necessarily are, meet with a ready sale at Paris, and booksellers make little difficulty in publishing them. The Société Historique are going on with this useful series of republications, either of expensive or scarce books, inedited MSS. &c. The new edition of "Gregory of Tours," one of this series, is quite a popular book. The last work published is a series of letters of one of the Dukes of Burgundy. To persons fond of moral, or rather criminal statistics, the curious work of M. Frégier, on what he terms the dangerous classes of society, is full of interesting matter. He includes in his observations the frail and the guilty of either sex, and derives his information principally from Paris. The work, as far as the statistical returns are concerned, is, indeed, to be looked on as principally relating to the French capital. He reckons the total number of what he calls dangerous individuals to be 63,000 in this city, being nearly the same as that of the pauper inhabitants. Of these there are about 30,000 who live professedly by vice and crime. There are about 17,000 workmen, whom he classes among the dangerous, from their custom of getting drunk to excess, and who live on spirits rather than on wine. The *chiffonniers* of Paris come in for their proportion of this category. The number of regular vagabonds (*gamins*) is about 1500—many of them forced to become such, in order to escape from cruel masters to whom they have been apprenticed, or from the discomfort and wickedness of their homes. M. Frégier does not point out any very definite plan for the remedying of the evils that are almost inseparable from large masses of men, but it appears from his returns, and the fact is important, that the moral condition of the populace varies in a direct ratio with their physical improvement; in other words, that the better off they are, the less vicious do they become.

M. Texier, who for some months past has been travelling in Asia Minor with Counts De la Guiche and De la Bourdonnaye, has recently sent to a friend in Paris an interesting letter, full of curious particulars as to the present political condition of Armenia, Persia, and Kurdistan. At Tabriz, he has found the native Christian architecture to be of a very peculiar type. Like the Byzantine, the churches are all painted throughout on the inside, and the paintings themselves are pregnant with characteristics of Armenian-Christian traditions.

One church in particular, well preserved, is evidently of the thirteenth or fourteenth century. There will no doubt be a brilliant book published some day or other on the results of these travels.

#### LITERARY AND LEARNED. UNIVERSITY INTELLIGENCE.

OXFORD, Jan. 23.—The following degrees were conferred:—

*Masters of Arts*.—E. Sleaf, Brasenose College; Rev. J. Rowlandson, Rev. R. Blakiston, Queen's College; E. Woolcombe, Fellow of Balliol College; Rev. J. C. Bentley, St. John's College.

*Bachelor of Arts*.—S. Andrew, Lincoln College.

#### ROYAL ASIATIC SOCIETY.

JANUARY 18. Professor Wilson in the chair.—Fellows were elected. Among the presents were samples of Assam tea, from the chairman of the East India Company. Some was prepared and tasted by the members; and the general opinion upon it was very favourable.—A portion of an account of the 'Chinese Secret Society of the *Tien-ti-hui*,' by Lieut. Newbold and Major-general Wilson, was read to the meeting. The paper enumerates several associations existing in China from ancient times, all of which were necessarily illegal; as the government prohibits, absolutely, any confederation of more than five persons. The one in question can be traced back to the third century of the Christian era; and was, at one time, legalised in consequence of having saved an emperor from a dangerous rebellion; though the emperor subsequently became jealous of its influence, and put most of the members to death. From the few who escaped the massacre, the present numerous association derives its origin. The society is now found wherever Chinese are found. In 1817, between two and three thousand members were apprehended at Canton; and, in 1826, large numbers of them at the settlement of Malacca seriously excited the apprehension of our government. In Java, at Rhio, and other Dutch settlements, they have concocted dangerous conspiracies against the authorities; and so long ago as 1799, they set at defiance our government at Penang; and were not reduced to subjection without the most rigorous measures. In Siam, they were, until recently, strong enough to resist the power of the government; but they have, at length, been compelled to submission. The paper gives a detailed account of the ceremony of admission to the body; and a translation of thirty-six oaths, which a new member must take upon his admission. These oaths consist of obligations to mutual assistance; and the imprecations against the transgressors are generally death, under various forms; such as, may he die under 10,000 swords; may he perish by an ulcer—by vomiting blood—by an arrow—a rocket—a great gun—a thunderbolt; may he die without burial on the road—in the sea—at the bottom of the sea, &c. &c. Then follow thirty-six rules to be observed, which are of a similar tenour with the oaths; after which the party makes a vow to be true to the society; and ratifies it by drinking a mixture of blood and spirit. The secret signs of recognition are then detailed; and they consist of certain forms of expression, and modes of performing the ordinary business of life, agreed upon by the body. After giving an account of the Malacca branch of the association, the paper concludes with a *résumé* of the principles of the body, which are compared to those of the Freemasons; but its practice is correctly

stated to be much more in accordance with the secret tribunals of Germany; both by their opposition to government, their combinations for fraudulent purposes, and the murders which they encourage each other to commit. It is recommended that the colonial government should have an eye upon these associations; for though the accusations brought against them may not be true to the full extent, the power they have actually attained by combination has, in several cases, been found subversive of the ends of good government, and injurious to the rest of the community.—The next paper read to the meeting was one by Lieut. Conolly, 'On the Silvery White-haired Goat of Angora,' peculiar to that district of Asia Minor; and on another species of goat, found not only in that district, but in various parts of the Turkish empire, and resembling the shawl-goat of Thibet. The Angora goat, peculiar to the province of that name, is invariably white, with long silky hair, of one sort only. If taken from the province they are with difficulty kept alive, and always deteriorate so as to be no longer recognisable. It is remarkable that the cats and dogs of this province have also long silky hair; the former over the whole body; the latter, on the ears and tails only. This may arise from the nature of the country, which is hilly, and composed of chalk, and is very dry: the vegetation, upon the whole, rather scanty, and the trees small. The Angora goats are clipped annually, and yield from one to four pounds English at each clip. The price of the ordinary sort in the Angora bazar, is now (Sept. 1839) nine piastres per oke, less than 7½d. per pound. The picked samples fetch 11d. per pound. That of the animals killed for food being removed from the skin by a preparation of lime, is thought to be injured by the process; and is, in consequence, sold at a lower price. The skin is exported to Constantinople, where it is dyed of various colours, and used chiefly for Turkish boots and slippers. The hair is exported either in the raw state or in yarn, or manufactured into those delicate stuffs so well known in Europe. Some of the fleeces are exported entire to Turkey, where they are used for seats for religious doctors; and a few reach Europe, where they are valued as rugs and saddle-cloths. A good skin costs a pound at Angora, and thirty shillings at Constantinople. The hair is carded by the women, and then spun. In this process it is well moistened with saliva before it is drawn from the distaff; and it is stated, that in the melon season the yarn is much better than that spun at any other time, because the melon imparts a mucilaginous quality to the saliva, which softens the hair. Before the yarn is used by the weaver it is well saturated by *chireesh*, a liquor made from a root like a radish, brought from the neighbourhood of Konia. The process is a strange one, and was witnessed by Lieut. Conolly. The yarn is stretched out on wooden frames, like the hempen lines in a rope-walk; and two men, with large bowls of *chireesh*, take mouthfuls of the liquid and squirt it dexterously over the yarn in very minute showers; they are followed by others, who press the moistened yarn together, and then spread it out again, so that all the parts may receive a share of the *chireesh*. The operators complained that the liquor destroyed their teeth; but they doubted whether any mechanical contrivance would so well answer the purpose. The yarn is made into gloves and socks by women, who knit so finely that socks are sometimes sold at 100 piastres a pair

(nearly twenty shillings). The weavers reside chiefly at Angora; and, before the Greek revolution, when the exportation of the raw stuff was prohibited, there were 1200 looms employed at Angora, and 20,000 pieces of stuff sent from thence every year; now the number of looms does not exceed fifty, and they make only between 1000 and 1500 pieces annually. The exportation of wool, however, is very great; and there is little doubt that the province in general has gained much more than the city has lost by the change. The remainder of the paper, 'On the Second Race of Goats,' was deferred to the next meeting.

#### ROYAL SOCIETY OF LITERATURE.

JANUARY 9th. The following papers were read:—1. 'On the Pronunciation of some British and German Words, in the Time of the Romans,' by Sir Thomas Phillipps.—It is evident that those contemporary authors, Cæsar, &c., who have preserved some of the British and German words in use in their times, must have been guided by the ear in fixing their orthography, and are, therefore, very likely to have been misled. Thus, the Romans gave the name *Sabrina* to the river which the Welsh call *Hafren*, the aspirate having been so strongly pronounced as to seem to them to be the consonant *s*; as conversely, the Welsh, in adopting, as they appear to have done, the Latin word *sal*, salt, were obliged to use the aspirate *h* to pronounce the Roman *s*, *hal* being the Welsh name for salt. From the application of the same principle to some of the German words preserved by Cæsar, we may pretty confidently infer, for instance, that *Cingetorix* is in fact nothing more than King Dietrich; *Vercingetorix*, Viking Dietrich; *Orgetorix*, Herr Dietrich, &c., both *Dietrich* (originally the governor or president of the diet), and the prefix in each case, being written as they sounded to the ear of Cæsar.—2. 'Notes on Obelisks,' by Jos. Bonomi, Esq. Egyptian obelisks are generally a tenth of their height in width at the base, and the part where the sides converge to a point is about a tenth of the height from the top: they are always of one stone, usually of granite. The image of gold which Nebuchadnezzar set up in the plain of Dura was precisely of the above proportions, and was probably an obelisk; the type of the solar rays (as defined by Pliny and Ammianus Marcellinus), in connexion with the Sabian worship of the Babylonians. Obelisks are generally placed at the entrances of temples; they are mostly covered with inscriptions, not excepting the pyramidal summit, unless, when this is covered with bronze, as is the case in that of Luxor, and some others. The three most ancient obelisks at Rome are those of San Giovanni Laterano, Porta del Popolo, and the Piazza Rotonda. The obelisk of San Giovanni Laterano, the largest of these, having been brought from Heliopolis to Alexandria by Constantine, was transferred from the latter city to Rome by Constantius, and placed in the Circus Maximus; whence Sixtus V. caused it to be excavated, and erected in its present site, A.D. 1588. Its height is about 144 palms. The sculptured representations on this monument are of the times of Thothmos III., Thothmos IV., and Rameses; the figure of the god Amon is frequently introduced; and it is particularly worthy of notice, that wherever he appears (except on the base, which was executed in the reign of Rameses) there is a concavity of the surface, shewing that Amon, in these more ancient works of the Egyptians, usurps the

place of some preceding divinity, whose figure and titles have been erased to make room for those of his rival. With reference to the sculptures on this monument, it was observed by the writer, that so ancient are some of the most admirable works of the Egyptians, that both the knowledge of anatomy and the mechanical skill displayed in them must unquestionably have been derived from antediluvian sources. The lions of Lord Prudhoe, in the British Museum, are the best sculptured representations of the animal in this country: although the lion is our national hieroglyphic, and there are many hundred statues of him, yet not one among them all appears without a defect, which makes our representations of him belong to the class *canis*, instead of *felis*—a fault not found in any Egyptian sculpture. The obelisk of the Piazza del Popolo, commonly known as the Flaminian, is the third in point of size now standing in Rome: its height is 107 palms. It was brought from Heliopolis by Augustus, and placed in the Circus Maximus, whence, like the former, it was excavated by order of Sixtus V. and elevated on its present pedestal. The high historical value of this monument, as well as of that of San Giovanni, is increased by the circumstance of its being the work of more than one monarch: the east face is entirely the work of Rameses, and the three other faces chiefly the work of Osirei. The obelisk of the Piazza Rotonda was re-erected by Clement XI. A.D. 1711. It is much smaller than those of the Lateran and Porta del Popolo, being only seventy-two Roman palms in height. It presents the peculiarity of a conical apex, and has only a single column of hieroglyphics, with the nomen and prenomen of Rames II. on each of the four sides. Mr. Bonomi exhibited drawings, mathematically exact, of these three monuments. Among other very curious remarks on obelisks in general, with which this paper concluded, it was observed, with reference to their original sites, that none are found on the west bank of the Nile, as no pyramids are found on its eastern bank in Egypt proper; the obelisk appearing to be a decoration of the cities of the living, symbolised by the rising of the sun, as the pyramid is of those of the dead, symbolised by the setting of that luminary.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday*.—Entomological, 8 P.M.; British Architects, 8 P.M.; Medical, 8 P.M.  
*Tuesday*.—Linnæan, 8 P.M.; Horticultural, 3 P.M.; Civil Engineers, 8 P.M.; Electrical, 8 P.M.  
*Wednesday*.—Society of Arts, 7½ P.M.; Geological, 8½ P.M.  
*Thursday*.—Royal, 8½ P.M.; Antiquaries, 8 P.M.; Zoological, 3 P.M.; Western Literary, 8½ P.M.  
*Friday*.—Royal Institution, 8½ P.M.; Botanical, 8 P.M.  
*Saturday*.—Westminster Medical, 8 P.M.; Physical, 8 P.M.

#### FINE ARTS.

##### BRITISH INSTITUTION.

THE British Institution opens on Monday, and the private view is to-day. We are much gratified in being able to state, from a hasty glance, that not only does the *ensemble* do honour to our national school of art, but that the details are well suited to sustain its character. We have not time now to particularise, but, in the north room alone, we were struck with a small sporting picture, by E. Landseer; a sacred subject, by Eastlake; admirable sea-pieces, by E. W. Cooke; a grand Alpine landscape, by A. Calame; Farewell, by McClise; and others of rare merit by Goodall, Linnell, Creswick, Inskipp, Lander, Stephanoff,

Leigh, Rothwell, Lee, &c. &c., not to mention Howard and Turner.

#### NEW PUBLICATIONS.

*The Royal Lodges in Windsor Great Park.* From Drawings by H. B. Zeigler; executed by L. Haghe, in Lithography, by express command, for her gracious Majesty, Queen Victoria. Ackermann and Co.

THE well-known talents, both of the original draughtsman and of the lithographer, render it almost unnecessary for us to say that this is a beautiful publication. "These lodges have been repaired and embellished since the death of George IV. The alterations and additions to the buildings are marked in the ground-plans, in darker colour. The decorations in the chimneys, roofs, windows, gates, and outside stuccoing, also the change in the disposition of the grounds adjoining the different lodges, are displayed in the perspective drawings." In addition to the architectural excellence of these drawings, the masterly execution of the foliage, and the spirited and happy introduction of the figures, deserve to be noticed. In both the latter two respects, "The Lodge at the Double Gates on the Long Walk" is pre-eminent.

*Engravings from the Works of the late Sir Thomas Lawrence, P.R.A. Part VII.* Hodgson and Graves.

It is so long since we received a number of this splendid publication, that we began to be apprehensive it was discontinued. We are glad to say, not only that that is not the case, but that the part before us equals in beauty and spirit any of its predecessors. It contains portraits of Lord Melbourne, Marshal Blücher, and Master Loch. The last always struck us as being one of the most fascinating of Lawrence's productions. It has been admirably engraved by Mr. Humphrys.

*The New Sepia Landscape Drawing-book, for Practising with the Hair Pencil.* By William Walton. In Three Parts, each containing Four Plates. Ackermann and Co. EXCELLENT examples to prepare a tyro in the arts for achievements of greater difficulty.

#### THE DRAMA.

THE dramatic entertainments of the week offer little of novelty for remark. *Mary Stuart* fulfils our prediction, notwithstanding some bitter assaults from the press, and attracts full houses. We are sorry to see every effort to tread in the higher walks of the drama, instead of encouragement, meet with ridicule or abuse, by writers, whose principle seems to be, not to promote the interests of the stage, but to shew off their own talent for sarcasm or malevolence;—the easiest, perhaps, of all literary or critical displays. *Fra Diavolo* was fairly performed at *Drury Lane* on Tuesday; and on Wednesday, a very slight comic opera was produced, called *My Lord is not my Lord*. It is an adaptation of Boieldieu, and some of his pretty music, heard for the first time, was well executed by Leffler, H. Phillips, Morley, Duruset, and Mrs. Alban Croft. [In mentioning this lady, we cannot help adverting to, apparently, a notorious fact, which reflected little credit on the parties concerned; viz. that there was a predetermined and ungenerous partisan opposition to her, which began even before she had uttered a note. Under any circumstances such conduct is reprehensible, but towards an unoffending woman it is disgraceful; and we trust that, if attempted again, the

spirit and justice of the audience will be shewn in putting down the efforts of a small clique, rather than in being misled by it into a humour of condemnation.] The plot and dialogue have no claim to merit. All the pantomimes appear to continue in great popular favour. *Drury Lane*, for its coco dance and panorama; *Covent Garden*, for its excellent opening, and admirable scenery and appointments throughout, as well as the Grieves' fine picture; and the *Adelphi*, for its fun and humour in the good old style of tricks, tumbles, &c., with a pretty little Columbine (Miss Mayo), and the incredible performances of the three Bohemian brothers. At the *Musard Concerts* the overture to "Jeasonda" (*Sphör*) has been produced with great success.

We see in the "Hampshire Chronicle" a name introduced to the stage which revives old and cherished recollections, viz. that of "Mr. Henry Betty," who had appeared as *Claude Melnotte* (*Lady of Lyons*), at the opening of the Chichester Theatre on Wednesday, and with enthusiastic applause. He is the son of the famed "Young Roscius" of our young days, and from all we hear bids fair to be a high ornament to the profession to which he is ardently devoted. Twenty years of age, a manly person of some six feet in height, an expressive countenance, and an intelligent and cultivated mind, are great requisites for dramatic excellence; and these, we are assured, he possesses in an eminent degree. It is with pleasure, therefore, that we record the auspicious commencement and prospects of one so nearly connected with a performer who so justly entitled himself to the admiration and esteem of the public as the quondam "Young Roscius." Mr. H. Betty is now announced to open the theatre of Halifax; and his *Alexander the Great* is spoken of in terms of very high approbation.

*Private Theatricals.*—At the Haymarket, on Thursday, a company of amateur performers represented *Cinderella* and *The Critic*. Altogether the performances were most creditable to their taste and talent; but the magnet of the evening was the *Cinderella*, a very handsome girl, with a magnificent voice: she is, we have heard, a Miss Edwards, a pupil of the Royal Academy, and, we presume, intended for the profession. If so, we can congratulate it on the prospect of an addition of the very highest promise in the musical world. The *Count*, also, possessed a sweet voice; and the *Valot*, a considerable share of humour.

#### CATLIN'S INDIAN GALLERY, EGYPTIAN HALL.

A FORTNIGHT ago, we briefly noticed Mr. Schomburgk's interesting exhibition of the products of Guiana, its arms, manufactures, natural history, and people, three of whom, with their long tubes and poisoned arrows, shew how the chase and war are carried on in their wild and savage regions. We have now to announce the opening of another exhibition, from visits to which every class of the community, old as well as young, will reap much instruction and gratification. Having recently described, from an American journal, Mr. Catlin's seven or eight years' sojourn among the red races of North America, we need now only say, that his representation of them, their country, their costumes, their sports, their religious ceremonies, and, in short, their manners and customs, so as to enable us to form a complete idea of them, is deserving of the utmost praise. There are above five hundred subjects in these spacious

rooms, from a wigwam to a child's rattle; and every thing belonging to the various Indian tribes are before the spectator in their actual condition and integrity. There are, besides, a multitude of portraits of the leading warriors, &c. &c., and other pictures of dances, ball-play, ambuscading, fighting; and the whole supplying by far the most ample and accurate history of them that has ever been published to the world. No book of travels can approach these realities; and after all we had read of the red men, we confess we are astonished at the many new and important points connected with them which this Gallery impressed upon us. We saw more distinctly the links of resemblance between them and other early and distant peoples; and we had comparisons suggested of a multitude of matters affecting the progress of mankind all over the earth, and alike illustrated by similitudes and dissimilitudes. Indeed, the philosophical inquirer will be delighted with this exhibition, whilst the curious child of seven years of age will enjoy it with present amusement and lasting instruction. We really congratulate the inhabitants of the metropolis, in having open at the same time two such valuable lounges as Mr. Catlin's North American Indians and Mr. Schomburgk's Guiana: it is thus that we have the most interesting and remote portions of the globe set, as it were, before our eyes for contemplation and study.

#### VARIETIES.

Metropolitan Table\* of Mortality for the Week ending January 11th.

*Mrs. Boddington.*†—We cannot pass over without a comment the loss the literature of England has sustained in the death of Mrs. Boddington, whose name has just become known to the world by a volume of poems lately published. Many conjectures were raised as to the real writer of the works which have appeared by the author of the "Slight Reminiscences," a book which justly excited a mingled feeling of curiosity and admiration, and was brought to our particular notice by the article which appeared at the time in the

\* These Tables are now circulated weekly; but we merely insert an abstract of one as a sample of the information they give.—Ed. L. G.

† One age not specified omitted.

‡ Whose last volume of poetry was reviewed in the *Literary Gazette*, No. 1197.

"Edinburgh Review." This, and the subsequent prose works, by the pen of the same author, not only entitle Mrs. Boddington to the highest place in that class of literature, but stamp her as the founder of a style of descriptive narrative peculiarly her own, in which we admire a wonderful power of depicting nature, great originality, a variety and an endless flow of fancy, a happy mixture of pathos and sober thought with delightful cheerfulness and enthusiasm, a sunniness of mind shining throughout, and a pen (as has been admirably remarked) "thick dropping with beauty and gladness." Those who delight in the simplicity, feeling, and quaintness, of the earlier writers, must hail the volume of poems just published as a revival of a taste fast fading away, and, unfortunately, too often replaced by meretricious and affected extravagance.—*Galignani's Messenger.*

To the Editor of the Literary Gazette.

SIR,—While turning over, the other evening, the leaves of an *Old Play* (MS. *pena*), I fell in with the subjoined passage; and could not forbear applying it to a certain "coming event," which already "casts its shadow before." Until some other bard shall "sing the hymeneal" in "loftier rhyme," perhaps your readers may not be displeased with this "old and plain chant."

— "It is silly sooth,  
And dallies with the innocence of love,  
Like the old age."

Ever your obliged Servant,  
R. B. S.  
Perm. Coll. Oxon. 24th January, 1840.

"*Sforza* (Duke of Milan). Upon this junction may no envious planet  
Lour with aspect malign, but every star  
That doth begin the frontlet of the night  
Shed on these 'spousals its selectest influence.  
May Heaven's own angels tie the mystic knot,  
Adding a dower of approving smiles;  
And never harsher discord 'tween you come  
Than the first bridal kiss.—Here, take her to thee!  
And see, Almayne, that thou do rightly prize  
The union which we give thee: such another  
The Orient boasts not;—'twere a jewel meet  
To glitter in an Emperor's diadem.  
Thou seest, the rose of youth's but scantily blown  
Upon that tender cheek, which yet hath felt  
No ruder winter than a father's kisses.  
Look that thou shield it still, with heedful care,  
From all ungentle blasts and nipping air:  
Nor rougher visitant thereon betide;  
Than the warm May of thy soft amorous sighs:  
So may it ripen into complete beauty,  
And with its bourgeois fill the land with gladness.  
But we do dally with your youthful heats,  
Standing betwixt the altar and your loves.  
Away!—Ye have my choicest benison,  
And may the supreme King, whose Vice we are,  
Thereto his seal append!  
"Gonzago (a Councillor of State). Amen, to that.  
And he who, on this day of jubilee,  
Shall prove a niggard of his loyal breath,  
Nor cry *God save!* until his throat be hoarse,  
Is no true friend to Milan:—she disavows  
The recreant for her son!"

#### VERY ORIGINAL CORRESPONDENCE.

To the Editor of the Literary Gazette.  
23 Henrietta Street, Brunswick Square.

DEAR SIR,—The following account of the present state and prospects of the Insect World may prove highly acceptable to such of my brother naturalists as are enthusiastic lovers of entomology, and are longing for the bright and flowery days of spring, when they may again go forth and chase the insects over hill and dale, in philosophic carelessness of all treacherous bogs, prickly bushes, man-traps, and spring-guns. My information may be implicitly relied on, as I am (now that the postage is reduced) in perpetual correspondence with all the first entomologists in and out of the universe,—including Count Kokshufur of Berlin, Count Katchumail of Siberia, Baron von Kriatz of the North Pole, and Alderman Squers of Whitechapel, Massachusetts.

The flies have gone out of town in their buggies; the ticks are all gone to the dogs; the spiders have hung themselves in their own webs; there is a scarcity of all sorts of grub in the markets; the blue-bottles are all cracked; the lice have been destroyed by the military in their headquarters; the grasshoppers have ceased to cricket; and the bees wax wroth, and vow they will give us no honey unless we make an allowance for their queen's husband. Indeed the insects are becoming very flighty, and threaten to create such a buzz as will deafen the very ear-wigs; and we naturalists expect to be called out to capture them, and place them in safe custody in the cabinet of the British Museum. As for the once respectable *cheese-hoppers*, I regret to say they have changed their religion, and all turned *Jumpers*; and the *glow-worms* are all converts to

the new light.—Bude's I mean. The ants have become so troublesome that even the entomologists declare they are sick of ants (scrophulous). Lord Brougham intends to bring in a bill for the abolition of insects in turnips, and Lady Byron is about to publish a treatise respecting the health of the sick *ale*. Notwithstanding the inclemency of the season I still find the *butter flies*; for if I buy a pound of it in the morning it is all gone before night.  
Ever happy to contribute my mite to your excellent journal, I remain, &c. JAMES H. FENNELL, P.X.Z.

#### LITERARY NOVELTIES.

The Publishers' Circular.—Annual Catalogue of New Books, New Editions, Reprints, and Engravings, exhibiting the prices, dates of publication, and publishers' names, is just issued, price only 1s. 6d. It appears that, independent of a large number of pamphlets, there have been published in London nearly three thousand works, of which the following classification forms a portion:—On Agriculture and Domestic Economy, 17; Annual Pictorial Books, 12; Architecture, 33; Atlases and Maps, 12; Bibliography, 8; Dialects, 4; Drawing, 13; Engineering, 23; Geography, 13; General Guide Books and Local History, 52; Ditto for Ireland, 5; Scotland, 7; Railways, 16; Law, 93; Mathematics and Bookkeeping, 27; Medicine, Surgery, and Chemistry, 100; Natural History, including Botany and Conchology, 76; Painting, 7; Transactions of the various Societies, 16; of the remainder, Divinity bears a large proportion. In the department of Engraving there have appeared only five in line, excepting those works which appear in parts.

#### LIST OF NEW BOOKS.

Rain fallen, 1 inch and 45 of an inch; of which .5625 fell between eight and eleven o'clock on the morning of the 28th.

Edmonton.

CHARLES HENRY ADAMS.

#### TO CORRESPONDENTS.

We have to acknowledge the receipt of No. I. (February 1st) of "The London Magazine, Charivari, and Courier des Dames;" too late, however, for us to give any opinion of it, except that, like one of its titles, "the Charivari," it seems to deal enough in personalities.  
We have also to acknowledge No. I. of "The Comic Novel; or, Downing Street and the Days of Victoria," by Lynx, and full of droll wood-engravings.

#### ADVERTISEMENTS.

Connected with Literature and the Arts.

#### BRITISH INSTITUTION.

FALL MALL.  
The Gallery for the Exhibition and Sale of the Works of British Artists will be Open on Monday next, and continue open daily from Ten in the Morning until Five in the Evening.  
Admission, 1s. Catalogue, 1s.  
WILLIAM BARNARD, Keeper.

CATLIN'S NORTH AMERICAN INDIANS.  
Exhibiting in the Egyptian Hall, Piccadilly.

MR. CATLIN, who has been living several years amongst the wildest Tribes of the North American Indians, painting Portraits of their Chiefs, Views of their Villages, Games, Amusements, &c. will open his Collection to Private View on Monday and Tuesday, the 27th and 28th, and to the Public, on Wednesday, the 29th instant.  
This immense Collection contains 300 Portraits, in oil, selected from amongst forty-eight different Tribes, mostly speaking different Languages, and consisting of more than 200,000 souls. There are likewise in the Collection, 800 other Paintings of the Landscape and beautiful Prairie Scenes of the Great Far West; Views of Indian Villages—Indian Dances—Buffalo Hunts—Religious Ceremonies—Festivals, &c. peculiar to these strange people. Also, an immense Collection of their beautiful Costumes, Weapons, Pipes, Musical Instruments, &c. &c., so often described by Fenimore Cooper, Washington Irving, and lately by the Hon. C. A. Murray.  
Admittance, One Shilling. Open from 10 to 4 o'clock.

#### ROYAL DISPENSARY FOR DISEASES

of the EAR, No. 10, Dean Street.—Mr. Curtis will commence his next Course of Lectures on the Anatomy, Physiology, and Pathology of the Ear, on Thursday, February 6th. For particulars apply to Mr. Curtis, at his house, No. 2, Soho Square. Mr. C.'s Map of the Anatomy of the Ear, price 5s. and Chart of its various Diseases, with the Modes of Treatment, for the use of Students and Practitioners, may be had of all Medical Book-sellers.

#### TO BOOKSELLERS AND PUBLISHERS.

The Advertiser, who has been for the last twelve years engaged as Traveller for a wholesale house, being about to leave his present employers, would be glad to treat with any parties in the same line where his service may be required. References of the highest respectability. R. S. D., care of Mr. Smith, Newspaper Office, 128 Strand, London.

#### PIRACY.—MRS. PARRY'S YOUNG

CHRISTIAN'S SUNDAY EVENING; or, CONVERSATIONS ON SCRIPTURE HISTORY. An injunction having been granted by the Vice-Chancellor against a Volume issued under the title of "Sunday Evenings; or, an Easy Introduction to the Reading of the Bible," &c. by a Lady, published by Scott, Webster, and Geary, Charterhouse Square, which proves to be a pirated edition of the First Series of Mrs. Parry's work abovementioned, with a few colourable alterations; Messrs. Rivington hereby caution all persons against selling or purchasing this pirated edition.  
St. Paul's Churchyard and Waterloo Place. January 28, 1840.

Her Majesty's approaching  
Nuptials.

London: Simpkin, Marshall, and Co.

## HAMILTONIAN SYSTEM.

"We recommend those who wish to acquire a knowledge of languages in the least time possible, to use the books arranged with interlinear translations, by J. Hamilton."

The "Edinburgh Review" ascribes to the author of this system "the great merit of introducing translations made in inviolable accordance with a strict verbal analysis; and it remarks, that "it is this peculiarity which renders them such invaluable instruments to the learner."

The following Books, on the Hamiltonian System, are published at Routledge's School Library, 121 Fleet Street:—

LATIN.	s. d.	FRENCH.	s. d.
Gospel of St. John	4	Elizabeth, Exile of St.	4
Epistolarum Historiarum Sacre	4	beria	4
Asop's Fables	4	Florin's Fables, 12mo.	4

The History, Principles, and Practice of the System, 1s. 6d.

## THE COOK'S ORACLE.

A new edition.

2. Mrs. Dalgairn's Cookery. A new edition, with Additions, price 6s.

Robert Cadell, Edinburgh; Whittaker and Co. London; and all Booksellers.

Price 1s. with Two Engravings on Steel, including a Map of France, Part II. of the Juvenile

## HISTORICAL LIBRARY.

By Miss JULIA CORNER.

Author of "Questions on the History of Europe: a Sequel to Macaulay's Historical Questions," &c.

Being the commencement of a Series of Histories for the entertainment and instruction of Youth and Families; in which will be contained the historical events of every civilised nation in the world. Especially adapted for School and Family reading, on account of its brevity, its propriety of language, and its truth.

London: Published by Dean and Mursely, Throldmole Street; and may be obtained, by order, from every Bookseller and Newsmen in the United Kingdom.

Agents for Ireland, Messrs. and Co. D'Olier Street, Dublin; Scotland, J. Macdonald, Princes Street, Edinburgh.

N.B.—Part II. completes the History of France, and may be had separately, or bound with Part I. in cloth, price 3s. 6d. making Vol. I. of the Historical Library. Part III. will commence the History of Spain and Portugal, and will appear on the 1st of March.

## NEW ZOOLOGICAL WORK.

Continued Monthly, in two Parts. Part I. price 2s. 6d. of a  
**NATURAL HISTORY OF QUADRUPEDS,**

and other Mammiferous Animals; comprising a description of the class Mammalia (including the principal varieties of the Human Race), with an outline of the comparative osteology and general organisation of its several groups;—being a complete history of all the known existing species, carefully adapted for popular information, and rendered interesting by copious details of their physical and intellectual powers, instincts, habits, and geographical distribution; together with an account of those extinct species, the remains of which occur only in a fossil state.

By WILLIAM CHARLES LINNEUS MARTIN, F.L.S.  
It will be illustrated by upwards of 1000 Engravings, of which about 500 will consist of representations of animals, beautifully engraved on wood, and drawn (in every practicable instance from the life) by William Harvey; the rest will comprise numerous anatomical, osteological, and other explanatory incidental figures, incorporated with the text.

The work will be printed on fine paper, in the very best manner, forming when completed, a handsome royal 8vo. vols.

Whitehead and Co. 78 Fleet Street, London.

By W. HARRISON AINSWORTH, Esq.

With Three Illustrations on Steel, and Four Woodcuts, by George Cruikshank.

Chapter V. Of the Misunderstanding that arose between Queen Jane and her Husband, Lord Guildford Dudley.

Chapter VI. Of the solemn Katholisation pronounced to the Glens by Master Edward Underhill, the Ho-gospeller, at their lodging in the Byward Tower, and of the Effect produced thereby.

Chapter VII. How Cathbert Cholmondeley was thrown into a Dungeon near the Beuillan Tower; and how a Mysterious Female Figure appeared to him there.

The Illustrations on steel comprise:—I. Cathbert Cholmondeley surprised by the Mysterious Female Figure—II. The Ho-gospeller Preaching to the Giants—III. Queen Jane Interposing between Northumberland and Simon Monard. The Woodcuts consist of:—1st, Of the Exterior of the Byward Tower—2d, Interior of the same—3d, Interior of St. Peter's Chapel in the Tower;—with, 4th, an Initial Letter, introducing a facsimile of Queen Jane's Inscription on her Dungeon.

Richard Bentley, New Burlington Street.

Solely Sold by all Booksellers.

In post 4to. 10s. 6d. neatly bound.

## THE THEORY and PRACTICE of BOOK-KEEPING, illustrated and simplified.

By E. F. FOSTER, Accountant.

The object of this work is to point out important defects in the common mode of teaching the art; to suggest the means by which those defects are obviated; and to introduce to the notice of teachers a simple, rational, and philosophical process of instruction, whereby the Principles of Double Entry are clearly unfolded: so that any person of ordinary capacity can obtain such a knowledge of the subject as will enable him to investigate and adjust the most intricate and diversified set of accounts.

J. Bower, 121 Fleet Street.

## BLACKWOOD'S EDINBURGH

MAGAZINE, for February, 1840.

An Outline of its Government, Laws, and Policy, and of the  
British and Foreign Embassies to, and Intercourse with, that  
Empire, with a Chart of Canton River. 8vo. 10s. 6d. boards.

By Peter Auber, M.R.A.S.

Late Secretary to the Hon. East India Company.  
"The subject is good, and the author a man of business, who  
has had access to the best sources of information."—*Spectator*.  
"It is exactly the kind of book which the times want."—*Literary  
Gazette*.

"This work shows very extensive reading on the topic to which  
it relates, and will be perused not only with satisfaction, but with  
pleasure and interest."—*Times*.

### III. Considerations respecting the Trade with China.

By Joseph Thomson, late of the East India House.  
Post 8vo. 5s. boards.

"This is a reasonable publication, and will contribute in no  
small degree to the information that is so essential to the whole  
mercantile community of the United Kingdom, and will doubt-  
less tend to promote the interests of British commerce. It  
abounds with carefully considered and many important sugges-  
tions for the use of our mercantile classes."—*Monthly Review*.

## MR. BENTLEY'S NEW PUBLICA- TIONS.

### I. Cousin Geoffrey, the Old Bachelor: a Novel.

Edited by Theodore Hook, Esq.  
Author of "Jack Brag," "The Parson's Daughter," &c.  
3 vols. post 8vo. with Portrait of Mr. Theodore Hook.  
(Immediately.)

### II. The Ingoldsby Legends;

Or, Mirth and Marvels.  
By Thomas Ingoldsby, Esq.  
1 vol. post 8vo. bound, with numerous characteristic  
illustrations. (New ready.)

### III. Norway and the Norwegians.

By R. G. Latham, Esq.  
Fellow of King's College, Cambridge.  
3 vols. post 8vo.

### IV. Fitzwiggins; a Novel.

By the Author of "Sydenham." 3 vols.

### V. The Saucy Jack;

Or, the Privateer and the Indianan.  
By Lieut. Charles Peake, R.N.  
2 vols. 18s.

"This work abounds in the most desirable of all muniments of  
attraction—novelty. In it we can trace no proofs of a worn-out  
brain. The story is remarkably well told, and does honour to the  
author."—*Dispatch*.

### VI. Sam Slick's Letter-Bag of the Great Western.

1 vol. post 8vo. bound, price 10s. 6d.  
"We are compelled, on this occasion, to let Sam Slick have  
all the talk to himself; for his new work is so full of excellent  
readable and extractable matter, and so infinite in its variety,  
that we cannot spare room even for a running commentary. We  
recommend our readers to send for this pleasant volume at once,  
for it will cheer their long winter evenings, and gladden their  
fire-sides."—*Athenaeum*.

aforesaid, at the LITERARY GAZETTE OFFICE, Number  
7 Wellington Street, Waterloo Bridge, Strand, in the said  
County, on Saturday, February 1st, 1840.

### REVIEW OF NEW BOOKS.

*Social Life in Germany, illustrated in the Acted Dramas of Her Royal Highness the Princess Amelia of Saxony.* Translated from the German, with an Introduction and Notes. By Mrs. Jameson. 2 vols. 12mo. London, 1840. Saunders and Otley.

Mrs. JAMESON has selected and translated five out of the fifteen or sixteen dramas produced by the Princess Amelia of Saxony, and thereby, in our opinion, conferred a sensible obligation, not only on dramatic literature, but on the literature generally both of Germany and England. The royal house of Saxony seems to be deeply imbued with literary taste and a love of letters, which several of its members have cultivated with a degree of talent and devotion that would reflect honour on the pursuit of any individual in the common walks of life.

"In alluding to the literary accomplishments of the reigning family (Mrs. Jameson observes), it should not be omitted that the present King of Saxony, brother of the Princess Amelia, published, when crown prince, a work on Botany and Mineralogy; and that the princess's younger brother, Prince John, has translated Dante into German verse, of which the first part, containing the 'Inferno,' appeared a few months since, and the second part is, I am informed, on the eve of publication (1840)."

And "here (she tells us further) is a princess of one of the proudest and most ancient of the sovereign houses of Europe, the sister of a reigning king, one hedged round from infancy by an almost impassable barrier of court etiquette, and in mind, manners, and appearance, a most feminine and unassuming creature, who suddenly steps forward in a department of literature the most arduous in itself, the furthest removed from her position in society, and her sphere of observation and experience—the drama of actual common life."

It would strike us at first sight that such a position was most adverse to that species of observation from which alone dramatic excellence in the delineation of manners could be attained; and we ask ourselves, Is it possible or likely that a princess, living in the artificial circle of a court, where nature is unknown, truth rarely, if ever, heard, and actual character concealed under impenetrable veils of constraint and hypocrisy;—is it likely, we say, that a person so situated should be able to make herself acquainted with the habits and feelings of various of the lower classes of the country, so as to paint them with even an approach towards the real, and still less with a remarkable degree of verisimilitude and accuracy? To portray "the actual state of society" is the object; and the accomplishment of this most difficult task the translator, in an introductory dialogue, declares to be the great charm of these dramas.

"They will (she remarks through her interlocutors, Alda and Medon) be thought very un-English? Exactly so. It is because these dramas are so essentially German in spirit and in style, that I have translated them with such close fidelity to the spirit, and such an almost literal adherence to the style. In this, as it

appears to me, lies their true interest, their real value.—Medon. And, meantime, if it displeases the English taste?—Alda. I make it here not a question of taste, but of curiosity and information. The question, methinks, is not how should men and women behave and express themselves in England, but how is daily, homely life arrayed in Germany? What appearance does it put on? In what do their manner and modes of expression differ from ours? And when we have taken this in at one rapid glance, we may reflect on it at leisure—go deeper, and amuse ourselves with tracing to their source the differences and affinities in national manners. And we may also ask, how it is, and why it is, that dramas so popular in Germany, so unaffected, so elegant, so refined, would be insufferable, or at least ineffective, on the English stage?—a question not speedily nor easily answered!—Medon. You tell me that these productions are more remarkable for the delineation of character and manner than for effect and situation; but that which renders them unfit for our theatre may render them better worth perusal."

Mrs. Jameson seems to have felt that the question we have intimated would suggest itself to every reader, and she, to a certain extent, attempts to account for the princess's capabilities by noticing the vicissitudes of her life, which opened to her some of those opportunities for observation of which she has made so skilful a use.

"The Princess Amelia [born in 1794], then ten years old, was educated by her two aunts, the Queen Maria Amelia, and the Princess Maria Theresa, wife of her uncle Antony, both distinguished women. The etiquette of the court of Saxony was exceedingly minute and severe. The princesses were brought up in strict seclusion. 'Their foot,' as the song says, 'might never touch the ground;' and I have heard that one of them, when these punctilious disabilities were removed, made it her first request to be allowed to cross on foot the beautiful bridge over the Elbe, on which she had looked daily from her palace window for twenty years of her life. Had the old order of things gone on in the old orderly way, I cannot conceive the possibility of a Saxon princess becoming a writer for the public stage; but the world convulsion had begun before the birth of the Princess Amelia, and, by the time she was twelve years old, it had shaken to their very foundations the thrones, powers, and princdoms of Germany. Old grandses sat lamenting, and cut but a sorry figure, and old forms became as old rags.—Medon. And, what is more, all the patching and bedizening they have had since does not seem to have entirely restored them to public respect.—Alda. From this time till 1815, the Princess Amelia shared in all the vicissitudes of her family: saw her uncle-king twice exiled from his estates, and twice restored, a prisoner—and again on his throne; and during these chances, and changes, and reverses, which occurred during the most momentous period of a woman's life, from the age of twelve to that of three-and-twenty, what Amelia of Saxony, with all her good and rare gifts of nature, her quick perceptions, and

quick sympathies, might be feeling, and thinking, and suffering, and learning, we have no means of ascertaining; only the result is before us, and it is most remarkable. Would not any one have imagined that the tremendous drama played before her eyes, the sound of battle-thunder in her ears, would have given a high poetical turn to her mind—inspired gorgeous themes of tragedy, wondrous and pitiful?

A kingdom for a stage—princes to act,  
And monarchs to behold the swelling scene?—

No such thing! Borne on the surface of that great wave which had wrecked and overwhelmed empires, she was floated, as it were, into quite another hemisphere—the new world of real and popular life; awakening far more curiosity, sympathy, and interest, than the game of war and ambition played by her equals around her. What opportunities were granted to study variety of scenes and variety of characters—'to grapple with real nature'—to extend on every side her sphere of observation, at an age when the fresh youthful mind was warm to every impression, were not then lost;—were, on the contrary, put to most profitable use, though, perhaps, unconsciously. From their retreat at Prague, she returned with her family, in 1815, to inhabit the palace of her ancestors at Dresden—a very different being, I imagine, from what she would have been had she never left it; yet—no, I correct myself: not different in being, but different in working. The nature would have been there—the power; but would it ever have received the current stamp of authenticity, which only act and performance could give it?—That is the point."

And though Mrs. J. goes on with a more general topic, it is so beautifully treated that we cannot deny ourselves the pleasure of continuing the quotation:—

"Medon. And a very doubtful point! If 'many a gem of purest ray serene' lie hidden in dark unfathomable depths of poverty and misery, many a flower, born to diffuse fragrance and blessedness through God's world, droops faint, or runs rank in the confined atmosphere of a court, or in some similar hot-bed, where light and heat (which are truth and love) are admitted by measure. It were to be wished that the two extremes of society could be a little more just to each other; while you shall hear the vulgar great wondering and speculating over genius and refinement in a ploughman poet and a corn-law rhymist, you shall see the vulgar little, incredulous of the human sympathies, the tender yearnings, the brilliant, though often unemployed, capacities of those lifted above their sordid wants and cares: yet are they all one brotherhood and sisterhood: ay, 'one touch of nature makes the whole world kin!' Many a genius rests mute and inglorious within a trophied vault as well as in a village churchyard, equally stifled and smothered up by impediments and obstructions infinite. I should adore your Princess Amelia, if it were only for giving us a proof of this great truth. How came this princess, for example, to be the first of her sex who stepped forth from the recesses of her palace to be judged by her people at the common bar of

public criticism? In others of her class, the same or some corresponding power may have existed; but where got she the courage to manifest it in a country still under the influence of the old system of etiquettes and usages? Would she have had this courage, think you, while her uncle Frederic Augustus lived?—*Alda*. If my impression of his character be just, he would never have permitted such an infraction of all royal rule of right, and she would never have disobeyed him. Her two brothers, the present king, and the accomplished and liberal-minded Prince John, have grown up under a different order of things: to their sister's literary efforts they have not only given their sanction, but their approving sympathy also. After the restoration of the royal family, the Princess Amelia accompanied her father, Prince Max, to Italy; one of her younger sisters, the Princess Maria, having married in 1817 the present Grand Duke Leopold of Tuscany; and another of her sisters, the Princess Louisa, having married his father, the late Grand Duke Ferdinand of Tuscany, in 1821; in 1819, her younger sister, Josepha, married Ferdinand VII. of Spain. It was said that Ferdinand had first offered his hand to the Princess Amelia, and that she declined it, as she has invariably rejected every proposal of the same kind. She paid a visit to her sister in Spain, in company with her father, in 1824, and remained there some months. She also visited France, but was never, I believe, in England. In 1827, her uncle, King Frederic Augustus, died, leaving a daughter only (the Princess Augusta), and was succeeded by his brother Anthony, a good-natured, but weak and superstitious old man, who had no children, and was exceedingly attached to the Princess Amelia. I have been told that the manner in which she used her influence over him endeared her not only to the court, but to the people. Then, in 1830, occurred the revolution which changed the government of Saxony from a despotism to a limited monarchy, with an upper and lower house of assembly: at the same time, Prince Max, the next heir, resigned his claims in favour of his son, Frederic, who took the reins of government with the title of Crown Prince and Co-regent of Saxony. King Anthony died in 1836. Good old Prince Max, whose health had long been failing, lived from this time in complete seclusion, and we hear no more of him till his death, which occurred about two years since. These circumstances, already well known to you, I have thrown together briefly, and under one point of view, that you might form a picture in your own mind of the relation in which Princess Amelia stood to the events and personages around her—the circle in which she moved, lived, and worked, silently, as it should seem, for a long while at least. To all appearance, she was passing her time much as usual, dividing her year between Dresden and the beautiful summer palace of Pillnitz on the banks of the Elbe;—when, in 1833, she sent her drama of 'Lüge und Wahrheit' (Falsehood and Truth), to the principal theatre (the Hof Theatre) at Berlin, under the name of Amelia Heiter. Not the slightest suspicion seems to have been entertained of the real name and rank of the authoress, and it remained unnoticed till February 1834. On the birthday of the young Princess of Mecklenburg (a daughter of the King of Prussia), it was got up at the private theatre of the Prinzessinen-Pallast, apparently because they had nothing else ready for the occasion; it pleased a royal and courtly audience, was immediately produced publicly at the Hof

Theatre at Berlin with complete success, and soon afterwards upon every stage in Germany."

But argument is unnecessary to demonstrate the dramatic worth of these compositions; their great success on their native soil is the sure criterion of their high deserts.—

"The drama's laws the drama's patrons give,"

and applauding audiences are on the whole the best judges, if not the most astute critics. The only inquiry that remains for us is, What may English opinion be of such simple compounds? and we trust we may reply, that our high-seasoned dishes have not so depraved our taste and corrupted our appetite as to make us disrelish these lively, lifelike, natural, and charming performances. A refinement and elevation of the best of Marmontel, they furnish for every class, and for all ages, that delight and instruction which the French writer limited to a single view, the cultivation of youth; and they are thickly sprinkled with touches of beauty and pathos, which would shed a lustre on the highest places of the comic or tragic muse.

Of the two plays given after the introduction\* in the first volume, viz. "Falsehood and Truth," and "The Uncle," the translator prefers the latter, owing, perhaps, to the admirable acting she has seen of the principal character; but, for our parts, on perusal, we certainly like the former best; except that the *dénouement* deals far too mildly with Juliana, whose propensity for falsehood and intrigue causes all the mischief and misery in which the action is involved. It is not easy from plays constructed with so much simplicity, and offering neither striking situations nor highly wrought pas-

\* Of the desultory nature of this essay, the writer's opinions on the equality of the sexes, and defence of her former publications on the subject, the following example may suffice:—

"*Medon*. To confound together the social duties of the two sexes is surely a most dangerous and most absurd mistake; and this is the point at issue.—*Alda*. My astonishment is, that it could ever have been mooted: it never had been, were woman in her natural position. *Medon*. And what do you call her natural position?—*Alda*. She is the helpmate of man. The squaw who bears her husband's hunting tackle, and cooks his meal, is in her natural position, relatively to the state of society in which she lives. So was Madame Rowland, when she acted as her husband's secretary, wrote for him, spoke for him, and died for him.—*Medon*. Then, whatever man may do, woman may do!—*Alda*. Can she?—but it is not a question—she cannot!—You cannot overcome organic differences. My profession of faith, since you call for it, may be summed up in few words. I believe that men and women were created one in species; equally rational beings with improvable faculties; equally responsible to God for the use or abuse of the faculties intrusted to them; equally free to choose the good and refuse the evil; equally destined to an equal immortality.—*Medon*. All this I devoutly believe.—*Alda*. Well, then, this being granted, I do not see that the divine gospel law, under which we live, makes any distinction in the amount of virtue, purity of heart and person, and self-control, required in the two sexes. Do you admit this?—*Medon*. I must admit it: (aside) in theory!—*Alda*. Then, as a consequence, will you not admit that any merely conventional law which permits or creates inequality in this respect, must be productive of gross injustice and mutual depravation; and that if woman could resist it, she were right to do so?—*Medon*. If she could!—*Alda*. She would, believe me! But to proceed: this Christian principle of the moral equality of the two sexes being fully recognised, then it appears to me that the ordering of domestic life is our sacred principle, indisolubly linked with the privileges and pleasures as well as the pains and duties of maternity; that it is our vocation; in the real and in the figurative sense, to keep the fire burning pure and clear on the domestic hearth; and that the exclusive management of the executive affairs of the community at large belongs to men, as the natural result of their exemption from those duties and infirmities which the maternal organisation has entailed on the female half of the creation.—*Medon*. Your theory, like that of the writer of 'Woman's Mission,' supposes all women to be mothers, or to have a home; and this is not the fact.—*Alda*.—That it is not the fact, is a consideration which would lead us to the source of many contradictions and disorders. But you have had my theory; the practical part of the question would lead us too far at present—another time."

ages, but depending entirely on an unaffected development of character, and resulting circumstances, to choose any extract which can afford a fair idea of the whole: but we must endeavour to make a selection, and take part of a scene between Willmar (the accepted lover of Juliana) and Frederica, her lowly cousin, a creature of sincerity and truth:—

"*Willmar*. Do you think your cousin Juliana will be here again in the course of the morning?—*Frederica*. I think she will.—*Willmar*. Permit me to wait for her. [He sits down and takes a book from the table].—A new Annual, I see, with drawings and engravings.—*Frederica*. It is my cousin's.—*Willmar*. Have you read it?—*Frederica*. O no! how should I find time to read such things?—*Willmar*. I presume you are not very fond of reading?—*Frederica*. Yes, but then it must be.—[She stops].—*Willmar*. Well, what must it be?—*Frederica*. I mean, it ought to be something more useful.—*Willmar*. But nowadays, in literature the useful and the agreeable are blended; we have historical romances. Here, for instance, is the history of Mary Stuart arranged in the most delicious poetry.—*Frederica*. It may be so, and yet—*Willmar*. Such a production has at once all the attraction of truth, and all the charm of fiction.—*Frederica*. Of truth?—I do not quite agree with you.—*Willmar*. How so?—*Frederica*. I think truth can never be interwoven with fiction without in some degree suffering from the contact.—*Willmar* [with an expression of surprise]. Perhaps you may be right there.—*Frederica*. And therefore it is that these historical romances seem to me hardly fit reading for the unlearned; for were it not almost better not to be informed at all on such subjects, than to be imperfectly informed, or imbued with false impressions of real facts or persons?—*Willmar* [aside]. Really, the girl is worth talking to."

How pleasing and judicious is this dialogue! It leads to a change of partners, the process of which we cannot explain without copying nearly the whole drama, but which is thus wound up:—

"*Christine* (Frederica's affectionate nurse, to whom she has related the circumstances). That is most unaccountable, and yet you are his bride.—*Frederica*. His bride! O no; I do not yet consider myself as such.—*Christine*. But, for Heaven's sake, how is it?—*Frederica*. My uncle called me yesterday into the drawing-room, where I found Willmar and Juliana. He told me that Willmar loved me, and had offered me his hand. I know not how I felt at the moment; the fright, and I believe the joy too, struck me speechless. I trembled, and burst into tears: my uncle understood my tears to signify consent—drew me into his own room—forced on me the most beautiful presents of dresses and ornaments. Meantime Prince Adolphus sent to command Willmar's attendance; and, half an hour before the usual hour, my cousin Juliana dragged me in a manner to the theatre, whence I did not return till very late. And that is all I can tell you of the matter.—*Christine*. That is certainly quite a new style of match-making.—*Frederica*. Alas, Christine; my good uncle, I fear, has again been in too great a hurry; he is so quick with every thing: he loves Willmar, he feels kindly towards me; what he wished, he persuaded himself to believe, and on this supposition he has acted.—*Christine*. And must I then look up all my joy again? It cannot be—the banns have already been published.—*Frederica*. Yes, as I heard with terror.—*Christine*. And why

with terror?—*Frederica*. Because, till now, I have been unobserved, unknown: I am now rendered an object of remark, only to be, at the same time, an object of ridicule.—*Christine*. Ridicule!—if you are married to Herr Willmar?—And, after all, he must marry you—he cannot go back.—*Frederica*. And do you, Christine, think me base enough to accept his hand, unless assured of his love? and—[in a melancholy tone]—he does not love me.—*Christine*. And why should he not love you, I should like to know?—*Frederica*. As long as I never dreamed of such a thing, I was tranquil, and even happy; but all is changed now. One moment of hope that I might possess such a heart has destroyed my peace for ever."

The second volume contains three other equally characteristic and pleasing plays; but we feel that any extracts must be so imperfect in illustrating them, that we must leave them untouched, with our most hearty recommendations.

*Lady Jane Grey; an Historical Romance.*  
By Thomas Miller. 3 vols. 12mo. London, 1840. Colburn.

MR. MILLER already occupies a high rank among the writers of historical romance, which, notwithstanding the opinion put by the Princess Amelia of Saxony into the mouth of her heroine, *Frederica*, is certainly, when well executed, a very interesting and delightful species of reading. No doubt it mingles the invented with the traditional, and alters and perverts, if you will, the records handed down to us by History: but what is history? Is it perfect truth? Do we all agree as to the characters it represents to us, the circumstances under which they acted, the motives by which they were impelled, or the absolute events which resulted from these combinations? Alas, no! The line between true history and fable is so thin that an author may fairly transgress its apparent limit, and seem to pass from the one side into the other, without in reality having left the realm of verity for that of falsehood; or, *vice versa*, the land of shadow for that of substance. Imagination, in works of this kind, may only supplant misrepresentation in works of the other description, and as we are forewarned that we have to deal with the former, it is even a less dangerous source of error than the latter, which is imposed upon us with all the impressment and circumstantiality of undeniable fact. But leaving this argument, we may justly say of Mr. Miller's performance, that it has no tendency to lead the reader astray; for whilst he has taken the utmost pains to draw his historical personages with accuracy, from patient investigation of the best authorities, and much of contemporary light lately derived from the publication of state and family papers, he has at the same time so completely marked his fictitious agents and their actions, that no one can ever confound them or mistake the one for the other. Thus, on the one hand, we have Edward VI., Lady Jane Grey, Northumberland, Suffolk and his Duchess, Guilford, Cecil, and others, all painted with singular fidelity; and, on the other, Dukeness, a being believed to be possessed of supernatural powers; her grandson, Gilbert Potts; Wardour, a lover of the hapless Lady Jane; and Amy, her faithful friend, &c. involved, and producing extraordinary effects, in the plot, which it has pleased the writer to invent, to give a deep dramatic interest to his story, and enable him to introduce his inferior and general

portraits with the costume and manners of the age. In these respects there is very great merit in the work. There is no exaggeration in aught that concerns the real actors on the scene; and it is only on his supernatural means (consistent with the superstitions of the period) that Mr. Miller depends for his more powerful and marvellous conditions. Another of his admirable qualities is that which we would expect from his former productions, his feeling in poetry, and his fine perception of external nature. Of this the opening of the book affords a sweet example:—

"But few of the thousands who wander through the princely avenues of Greenwich Park in the present day, are aware of the wild features it presented three centuries ago; when its steep hill-sides were overgrown with thick underwood, and hundreds of old oaks bared their broad branches to the summer-sunshine, or shook their knotted arms in defiance at the black skies, and hollow winds of winter. There was then a savage and forest-like look in its scenery, which bore but little resemblance to its present appearance, if we except the enclosure, still known as the Wilderness; and where a few straggling deer may even yet be seen, couched amid the dark green bracken, or carrying their stately antlers erect, among the picturesque and jagged stems of the aged hawthorns. For miles around, the country had then a grand but fearful look: a deep woodland threw its immense shadow over the high brow of Shooter's Hill, and stretched far away beyond the grey walls of Eltham Palace, thus affording a safe shelter to the numerous bands of robbers and rebels, who at this period infested the neighbourhood." Blackheath, which has been the scene of so many terrors and triumphs, where Roman and Dane have in succession encamped, where Wat Tyler assembled his rough but determined followers, and London poured forth her thousands to welcome back the chivalry of Agincourt, wore a far different aspect to what it does in the present day. The broad, bare, and dusky space which we now tread, was in summer-time covered with thousands of gaudy heath-flowers, while the yellow furze and golden broom flaunted their bright blossoms, as if in mockery at the blasted and solitary trees, on which, during the reign of Henry the Eighth, had bleached the bones of so many of his victims. Nearly traversing the same direction as at present, a brown, rugged, high-road, went grovelling its way beside the moss-covered and weather-beaten palings of the park, until its winding course was lost to the eye amid the dark umbrage of the distant hill. High above the surrounding scenery, and occupying the very eminence on which the Observatory now stands, rose the grey and battlemented towers of Greenwich castle, then a strong fortress, from which the warning beacon had so often blazed. Such were the general features of the landscape three hundred years ago: and to which we would now draw the attention of our readers. But it is in the interior of the beautiful park where our story first opens."

Of the author's ability to do justice to his historical *dramatis personæ*, the following extract will be sufficient evidence. It describes the earlier portion of a meeting between Northumberland and Cecil, after the former had taken steps to secure the succession of the crown to Lady Jane Grey:—

"His thoughts were, however, soon turned into another channel by the entrance of an attendant, who came to announce that Sir William Cecil waited without;—then retired to

conduct the deep-plotting politician into the room. The countenance of the aspiring secretary (who first contrived to raise himself in the service of the Protector Somerset, and then to advance in Northumberland's favour, by aiding in the downfall of the former), wore not then that forbidding look which we trace in the portraits of the future Lord Burleigh. True, there was still the same high pile of forehead; the deep-sunken eye, and that immense length of feature which we see in the Bodleian portrait; but at the time he became a chief mover in our story, there was a blandness and pleasing expression in his features, in place of that sternness which after-years of care brought. He was then the smiling, but cunning courtier; the man whom but few of the readers of history would believe him to be; for it is only by the publication of the late letters from the State Paper Office that his true character has been brought to light. But even in his younger years, one skilled in reading the human face would have concluded that he was not a man to be trusted, unless his own interest tallied with the affairs in hand. There was a restlessness in his deep, penetrating eye—although at times his piercing glance fixed itself upon those with whom he came in contact, when unobserved, then wandered to another object the instant it was detected, as if afraid that his eyes might betray what was then passing in that capacious mind. There was something cold and cautious in the manner in which the duke received his powerful secretary—a kind of stiff deference, such as may often be observed in one holding a high station in life, who is, nevertheless, compelled to avail himself of the clearer judgment and mightier mind of his inferior in rank. 'I regret to hear that you have been unwell of late,' said the duke, after the stiff and cumbrous compliments had been gone through, 'but I have sworn in Sir John Cheek as an assistant secretary, that the business may fall somewhat lighter upon you.' The duke looked closely into the countenance of Cecil as he spoke, to see what change this unpleasant announcement would make in his features; but he had to deal with one who was a deeper dissembler than himself, and who allowed not a trace of his feelings to be seen. 'Your grace is ever considerate of your humble servant,' said the wily statesman, bowing low, and throwing a smile into his countenance, 'and doeth nothing that is unbecoming of your superior wisdom.' Northumberland bit his lip; he felt the full force of the insincere compliment, but it was one of those home-thrusts which even a great man must bow to when it is accompanied by such a smile; for his 'superior wisdom' was then about to be displayed by consulting Cecil on the very objects which weighed heaviest upon his mind. 'Better seat yourself, Sir William,' said the duke, ringing a small silver bell, and ordering the attendant to bring in wine, and rettrim the lamp. 'We must not cause a relapse by our neglect.'—And so he ran on with his compliments, which were just as interesting and unmeaning as they are in the present day. But Cecil was determined to come to the matter of business at once, and drank long life and health of the king, adding, 'How fareth his gracious highness by this time? I have not had mine eyes blessed by the light of his royal countenance for these three last days.' 'Our beloved sovereign hath his health but indifferently,' said Northumberland; then adding, while he kept his eye upon Cecil, 'He hath scarcely tasted a cup of wine since he drank happiness to the nuptials of our son Dudley, and our most virtuous and pious daughter the

Lady Jane Grey.' 'Doth, then, his highness's complaint baffle the skill of the leeches?' said Cecil, pressing the matter still closer, for he was fully prepared for the duke's answer. 'Or do you not think that the cares of state, though greatly lightened by your grace's wisdom, are somewhat too weighty for his weak health and tender years?' 'Thou hast hit it, good Sir William,' said the duke, seizing the silver drinking cup, and quite elated that the secretary had, as he thought, by chance stumbled upon the very heart of the business. 'It is that which preyeth upon his spirits; and fearing that his days may be but few, he hath also a dread that the old religion may again spread over the land, and render null and void all that has hitherto been done to establish our new faith;—and it is on this matter,' added he, after a brief pause, 'that I would fain have thy opinion.' 'I fear me,' said the crafty secretary, who was not ignorant of the height to which Northumberland's ambition soared, 'that the Princess Mary hath too long enjoyed her religious forms without let to change them now; but, assuredly, she who has been dealt with so leniently will let others enjoy their own faith unmolested.' 'That will but be a sorry trust,' replied the duke, shaking his head.

Mr. Miller had one difficulty to surmount in creating a deep sympathy for his subject, namely, that its catastrophe was already known, and that even the poet's genius could hardly excite human feelings more strongly than the simple narrative with which we are all so familiar. But in order to shew how very successful he has been in this case, we shall select, for our concluding example, the deathbed of the poor young king, Edward VI., whose immediate fate is attributed to his being poisoned with flowers at the instigation of the ambitious Northumberland. This passage will also serve to illustrate the appearance the reputed witch Duskena, and other points in the composition of the novel, so that our readers may form their own opinion of its more striking attributes and great variety of attraction.

"Could aught have awakened in the bosom of Duskena a feeling of pity and awe, the sudden transition from the room she had just passed (which blazed with a hundred lights, that flashed far across the broad bosom of the river) to that wherein the young monarch was confined, would have called it forth. Two tall wax-lights stood in the rich candelabras of silver, and threw a glimmering twilight over the apartment, which seemed to deepen the shadows in the niches, and here and there threw many a dark fold on the velvet coverlet, while it gave to the pale features of the dying monarch a yet more deathly look. At the foot of the bed stood Archbishop Cranmer, his hands still uplifted towards heaven, as they were while in the act of prayer. Latimer stood beside him, the old Greek Testament suspended from his girdle, while he himself rested with his head downwards, and leaning on his staff, as if he was still buried in deep devotion. Arundel and Cecil stood on either side of the couch, while Edward, with his hands compressed, and his eyes closed, seemed (but for his faint quick breathing) already dead. In the background stood the physicians, their arms folded, and their eyes fixed on the floor, like images of despair, meditating in gloomy silence over the scene. Even the heart of Northumberland sank within him, as the dying youth recognised him, and put out his hand, while he faintly whispered 'Has she come?' The duke made no reply, but pointed to where the hag stood, gitting her savage gaze upon the king. Her

eye had already wandered round to every face in the group: with Arundel she exchanged a glance of recognition and deep meaning; to Cecil she gave such a look as made the colour for a moment abandon his cheek; while her eyes flashed with hatred and vengeance as she gazed upon the countenance of Cranmer. And had the prelate at that moment known the strange being that stood before him, or heard her there thunder forth the cause of her hatred, his very frame would have shook at the thoughts of the deed, which all his prayers and tears had not then washed out, and which even sat heavy on the soul of the dying monarch. As the glances of the old hag wandered from the features of Cranmer to the royal invalid, and then seemed to settle on the floor of the apartment, her thin withered fingers ran hurriedly over the handle of her staff, like the talons of a dying hawk, which, in its last agony, possesses the will to strike, even when its strength has failed. Her whole frame seemed moved by some strong inward convulsion; her brow became dark as midnight; and her haggard bosom shook, until, grasping her staff with a firm clutch, she closed her eyes, and, by some powerful effort, soon stood again as collected as the calmest observer in the group.

"It was a wild but solemn scene, to witness the shrivelled form of that fearful old hag, in her tattered garments, presiding like some evil spirit over a death-bed. To see her unsightly rags blend with the rich escutcheon, and mingle fearlessly with the grim and golden lions that blazed on the crimson covering of the chair, while the heavy tapestry, which dropped its folds over the very couch where so many ill-starred beauties had slept in royal state, beside the departed voluptuary, fell down and buried half her form in deep shadow; and save the rippling of the river, which went murmuring through the deep midnight, all was silent as the grave. 'Is there any hope, good mother?' said Edward, in a faint voice, which scarcely exceeded a whisper, yet fell distinctly on every ear in that apartment. 'None!' answered Duskena, in a solemn tone, which sounded through every heart: 'the hand of Death is upon thee.' She then released his arm; and uplifting the nosegay, gazed upon him for several moments in silence, while a deep sigh escaped the monarch's lips, as he muttered to himself, 'Than all is over!' 'Wilt thou not essay thine art upon him?' said Cranmer; 'peradventure it may be the means of prolonging his life a few more days.' 'The houseless beggar who shelters beneath the sharp-bawthorn,' said Duskena, 'and feels the cold night-wind bite through his very skin, will soon find an end to all his miseries, if his blood floweth as feebly as the King of England's. Not all the broad lands of this realm, if sold, could purchase him life beyond the morrow.' 'Old woman,' said Latimer, now speaking, 'if it pleaseth the Almighty God, he can, in His great mercy, yet prolong his days for many to-morrows yet to come. With Him there is nothing impossible. *Spes mea in Deo.*' 'If the last blood of England's kings were alone centered in his veins, it would before sunrise be cold,' answered the old hag; who let fall the poisoned flowers, as if by chance, upon the coverlet, and saw the feeble monarch draw them towards him, and, after smelling, gaze ardently upon them: 'before another cock-crow, ye will believe the truth of what I have said. Neither medicine nor prayers will be of any more avail.' 'Wilt thou not, then, try thy skill upon his highness?' said one of the physicians. 'I have answered ye all,'

replied Duskena. 'He whom ye call his highness will soon be no more than the starved wretch whom the traveller findeth dead upon the highway, and whose name and kindred are all unknown.' 'We have administered to his highness's grace a sleeping draught, which may bring on a repose until the dawn,' continued the leech, without deigning to reply to the bold expressions which she had so fearlessly uttered. 'He will then be freed from all the power of our medicine; and perchance, when he awakes, thou wilt think differently.' 'I hear thee,' replied the hag: 'trouble me no more. When he sleeps again, it will be the sleep of death. Listen; his senses are already wandering. Disturb him no more, but let his spirit pass freely.' And the old woman partly threw open the window as she spoke, and let in a strong current of air, which drove the flames of the candles aside, and shook the rich curtains; while she muttered, in half-suppressed tones, 'Heat and cold may now fall on him alike; he shall never feel the effects of either again.' The physician was about to remonstrate against so unusual an act; but Northumberland beckoned him to be silent, and he obeyed; while Duskena again seated herself in the chair of state, and, resting her head on her staff, remained silent. Meantime, the dying king seemed utterly unconscious of what was going on around him; neither the conversation which had passed, the rustling of the curtains, nor the now audible roar of the river, arrested for a moment his attention. For some time his thin fingers continued to play with the flowers, and his memory wandered to other scenes as he talked to himself; and thus ran his thoughts: 'Frail emblems! how ye resemble myself, plucked thus early from your stems to wither and die. The sun will shine upon your fair companions when ye are no more; the refreshing dews can never cheer ye again; the soft summer showers have fallen their last upon your leaves. Other buds will blow in your places, now you are gone; like me, you will soon be forgotten. Ye die, and have no ending, while I live again after death. Death!' echoed the young king, after a long pause; 'mysterious change, after a few brief years of care! what art thou? I have set my feet upon the tranquil grave, where flowers fair as yourselves bloomed, and thought how, after a few years, there would be no trace that aught human slept there. Nought to tell that the heart which once beat with joy or hope, or ached with care and pain, slumbered beneath those flowers—nought that might distinguish the sovereign from the slave; for all alike mingle in the same common mould.' 'The small and great are there, and the servant is free from his master. There the prisoners rest together; they hear not the voice of the oppressors. There the wicked cease from troubling, and the weary are at rest.' But will all appear alike before the great tribunal of Him whose all-searching eye looketh through our inmost secrets? before whom all motives and all human actions are laid bare? Alas! I fear to know: my soul shrinks back alarmed into its inmost depths, as if it called upon me to shelter it. Would to God that I had obeyed all its dictates! It appeals to me now, when it is beyond my power to save it. God of mercy, my hope is in thee!'

In conclusion, we have only to repeat our eulogium upon the merits of this work, which does honour to its author, and, as we have stated, places him in a front rank among the most eminent cultivators of this species of polite literature.

*The History of Ireland.* By Thomas Moore, Esq. (in 4 vols.), Vol. III. Lardner's Cabinet Cyclopædia, Vol. 121. Small 8vo. pp. 327. London, 1840. Longman and Co.

THIS volume brings the Irish history down to the year 1545, *temp.* Henry VIII., and we fear the author has left himself too little room to finish it satisfactorily in another volume; unless, indeed, with a want of proportion, into which his imaginative nature has led him by inducing him to bestow too great a share of his attention upon the early, romantic, and legendary portions of his studious labour. The present *tome*, it is true, travels over three centuries and a half, but the importance of the events which followed in the reign of Elizabeth, under the Stuarts, and Cromwell alone, not to speak of later years, seems to us to require three volumes of more, instead of the one volume to which Mr. Moore announces his work to be limited.

We pass rapidly through the reign of John in ten pages; and Henry III. is dismissed in not quite twice as many. The three Edwards conduct us to page 118; and Richard II., Henry IV. V. VI., Edward IV. V., and Richard III., to page 196. Henry VII. occupies some thirty-five pages; and from page 230 to the end, we have the best division of the publication, viz. the reign of Henry VIII., which appears to be carefully written, and to have beneficially consulted the new materials which the two volumes of "Irish State Papers," published four or five years ago, have afforded the historian.

As specimens of the work we begin with the close of the reign of Edward III. :—

"It was (says the author) in the reign of the second Edward that a university was, for the first time, founded within the city of Dublin.\* A bull had been obtained for this object from Pope Clement V., by John Lech, archbishop of Dublin; and the task of carrying it into effect devolved upon his successor, Alexander de Bicknor, by whom statutes for the government of the university were established.† To all students frequenting this university, which was founded in St. Patrick's Cathedral, protection was extended by Edward III.‡; and in the year 1364, his son Lionel, duke of Clarence, granted to the dean and chapter an acre of land at Stachallane, and the advowson of the church, to provide for the payment of ten marks a-year to a person of the order of St. Augustine, to deliver a lecture upon divinity in the scholars' room.§ An ordinance passed by the English parliament, in the fifth year of this reign, that there should be one and the same law for the Irish and the English, is frequently referred to in the once interesting controversy with which Molyneux, the friend of Locke, connected his name. There is also another inquiry bearing upon the same question, which has no less divided our historical antiquaries,—namely, at what period Ireland began to have a parliament of her own;

and it seems to be agreed upon by the best authorities, that, until the reign of Edward II., all the deliberative meetings held in that kingdom, by whatsoever name they may have been called, were rather general assemblies of the great men, than, properly, parliaments.\* That they were sometimes considerable in numbers, as well as in rank, appears from a parliament of this description, held in the year 1302, at which were present no less than 156 persons; and in the following reign, a general assembly or parliament was convened; which, in addition to all the English nobility in Ireland, included likewise the four archbishops, ten bishops, the abbot of St. Thomas, the prior of Kilmalmainham, and the dean and chapter of Dublin. There were likewise present, on this occasion, several great Irish lords, among whom are the following, and thus designated,—O'Hanlon, duke of Oriel; O'Donnell, duke of Tyrconnel; O'Neill, duke of Tyrone. Until the period when regular parliaments began to be held in Ireland, it was usual to transmit thither, from time to time, the laws made by the English legislature, to be there proclaimed, inrolled, and executed, as laws also of Ireland; and there can be little doubt that what was then styled a parliament in that kingdom was no more than the summoning of the great men of the realm together, reading over to them the law or laws transmitted from England, and enjoining that they should obey them.† Among the last notices, respecting Ireland, that occur in the records of this reign, a curious entry in the Issue Roll for the year 1376 may for its quiet significance deserve to be noticed :—Richard Dere and William Stapolyn came over to England to inform the king how very badly Ireland was governed. The king ordered them to be paid ten pounds for their trouble.‡

Our next selection is spiced with romance and anecdote, the latter, perhaps, sufficiently known :—

"In consequence of his having been attainted by Poyning's parliament, the Earl of Kildare had been sent in custody to England, where he still remained a prisoner; and so deeply did his lady, the countess, feel this event, that it was the cause, we are told, of her death. One of the charges urged against him was, that he had sacrilegiously burnt down the church of Cashel; and the success of the defence made by him, when examined, respecting this outrage, in the royal presence, shews, if true, that the monarch's relish for Irish simplicity and humour was somewhat more awake than his sense of dignity or of justice. Confessing the fact of his having burnt down the church, Kildare pleaded as his excuse, that 'he thought the archbishop was in it;' which, being said with an odd bluntness peculiar to this lord, had the effect of at once amusing and prepossessing the king in his favour;—such natural frankness appearing incompatible with the finesse and intrigue attributed to Kildare. Henry had advised him, on the first hearing of his case, to

provide himself with good counsel, adding that his cause, he feared, would require it. 'I will then choose,' said the earl, 'the best counsel in England.' 'And who is that?' asked Henry. 'Marry, the king himself,' replied Kildare. 'Whereat,' says the chronicler, 'the king laughed.' So much, however, did all this simplicity of manner win upon the royal mind, that when the counsel against Kildare, in concluding his charge, said vehemently, that 'not all Ireland could govern this man,' the king replied, 'Then he is the fittest man to govern all Ireland.'"

We are sorry that our next quotation must evince a plentiful lack of information respecting Irish history. It comprises the whole of two reigns, and is as follows :—

"During the nominal reign of the fifth Edward, and the short usurpation of Richard III. the condition of Ireland remained unimproved and unchanged. Throughout this brief and bloody period, the power of the Pale was almost entirely in the hands of the Geraldines, the Earl of Kildare performing the functions of lord deputy, while his brother, Sir Thomas of Laccagh, was lord chancellor of the kingdom. In a parliament held at Dublin, by the Earl of Kildare, an act was passed which, for its unusually peaceful purport, may deserve to be remembered. It was enacted, 'That the mayor and bailiffs of Waterford might go in pilgrimage to St. James of Compostella in Spain, leaving sufficient deputies to govern that city in their absence.' By another act of this parliament, the corporation and men of the town of Ross were authorised to 'reprise themselves against robbers.\* Such are the only incidents worthy of any notice that occur in our scanty records of this reign, which was brought to a close by the battle of Bosworth, on the 22d of August, 1485."

It would be a waste of time to enter upon the sanguinary conflicts which never ceased to crimson this unhappy country with blood, the impatience of government, the butcheries of rival barbarians, or the struggles and intrigues of ambition with which every passage of this history is filled. The sketch, as we have observed, is rapid and concise, and from its nature could not be expected to evolve much of novelty. The latter half of the volume is, as we have remarked, the most worthy of attention; and from it we pick our concluding example :—

"In a parliament appointed to be held at the beginning of this year, but which did not meet till the 13th of June, an act was passed, which had been suggested more than once in the course of this reign, conferring on Henry and his successors the title of king of Ireland. This measure was adopted in consequence of a notion said to be prevalent among the natives, that the regal dominion of the kingdom of Ireland was vested in the pope for the time being; and that from him the king of England held the lordship of that realm. It was, therefore, hoped that Henry's adoption of the royal title would disabuse the Irish chieftains of their error, and lead them to acknowledge with less hesitation his paramount dominion. But there had now opened upon them a prospect, not merely of mercy, but of favours and honours, at the hands of royalty, which wanted no further inducement to draw them in that direction; and, throughout the remaining years of this reign, little else is left to the historian than

\* "In other words," says Sir William Betham, 'might rob the innocent to indemnify themselves for having been previously plundered.'—See 'Origin and History of the Early Parliaments of Ireland,' the latest and not least valuable of this indefatigable antiquarian's labours."

\* "Ware's Antiquities," chap. xxxvii. sect. 3."

† "One of the rules laid down for the government of this projected seminary would be thought, at the present day, rather startlingly liberal:—We ordain, also, that we and our successors may choose a secular regent in divinity, of any order of worship or religion whatsoever (*de quacunque religione*), who may actually read lectures on the Bible, in our church of St. Patrick, without any contradiction or calumny from any person whatsoever."

‡ "The king, in granting the desired protection, declares strongly his sense of the benefit of such studies; adding that, by those who most cultivate them, morality and virtue are most cherished, and peace in the land best preserved."—*Patent Roll*, 32 Ed. III."

§ "History and Antiquities of St. Patrick's Cathedral," by William Monck Mason :—a most valuable contribution to our antiquarian literature."

\* "Speech of Sir John Davies, when speaker of the Irish House of Commons, published by Leland, vol. ii. Appendix."

† "The mandate issued by Henry III., in transmitting to his Irish deputy, Richard de Burgh, the laws and charter of King John, shews how simple was, at that time, the process by which English statutes were made binding upon Ireland :—Mandamus vobis firmiter precipientes, quatenus certa die et loco faciatis venire coram vobis archiepiscopos, episcopos, abbates, priores, comites, et barones, milites et libere tenentes, et ballivos singulorum comitatum, et coram eis publice legi faciatis Cartam domini J. Regis patris nostri . . . et precipiat eis ex parte nostra, quod leges illas et consuetudines in Carta predicta contentas de cetero firmiter teneant et observent."—*Close Roll*, 12 Hen. III."

‡ "Issues of the Exchequer."

to pass in review the different chiefs who, with an almost lavish generosity, were in the same breath pardoned and rewarded, and some of whose names still stand memorials of this truly princely policy, among the most shining and honourable titles of the Irish peerage. In the instance of a wild mountain chief, named Tirlogh O'Toole, this course of policy was attended with circumstances not unworthy of notice. The sept of the O'Tooles, whose territory bordered on the marches of Dublin, had been, to a greater degree than many even of the more powerful septs, a source of annoyance and terror to the English Pale. Occupying the mountainous parts of the county of Wicklow, their only habitations were the wood and the morass; their only fortresses, the deep glens and mountain-passes. The reigning chief, however, Tirlogh O'Toole, combined with the ferocity of a border ravager much of that generous sense of honour by which the rude heroes of chivalry were distinguished; and, on one occasion, when all the great Irish lords, O'Neill, O'Donnell, O'Connor, and others, had leagued to invade the English Pale, Tirlogh sent word to the lord deputy, that, seeing the principal chiefs were now all combined against him, he, Tirlogh, thought it but fair to be on his side; but 'as soon as the others made peace, then would he alone make war with him.' This chivalrous promise the chief faithfully kept; nor was it till O'Donnell, O'Neill, and others, had made their submission and withdrawn, that Tirlogh, summoning forth his wild followers from their mountain-holds, renewed, fiercely as before, his harassing inroads on the English borders. Even to this rude and houseless warrior, the conciliatory influence of the royal policy had now found its way. Requesting a parley with the lord deputy, he asked for permission to repair to England to see the king, 'of whom he had heard so much honour,' and likewise to present to him an humble petition for some lands to which he laid claim. Wisely entering into what he knew to be the royal wishes, the lord deputy acceded to this request; supplied him with 20*l.* from his own purse towards his expenses, and gave him likewise a recommendatory letter to the Duke of Norfolk, who was then universally regarded as the warm friend and patron of Irish interests. It was also suggested that the castle of Powerscourt, which stood upon a part of the lands claimed by this chief, should be granted to him by the king. The Earl of Desmond, having at length consented to make his submission, acquainted the lord deputy and council that he was ready, on hostages being given, to repair to the borders of Cashel for that purpose. He had demanded that the Earl of Ormond should be given in pledge for him; but to this the lord deputy would not agree; and the hostages whom he sent instead were the archbishop of Dublin, the master of the ordnance, and his own brother. Among other articles of this submission, which was signed and sealed at Sir Thomas Butler's house, at Cahir, Desmond agreed to renounce, for himself and his heirs for ever, the singular privilege claimed by his ancestors, of never appearing at any parliament, nor entering into any walled town. To get rid of the variance between him and Ormond respecting the title of the earldom of Desmond, it was agreed that a cross-marriage should take place between their children; and each bound himself to the other in the sum of 4000*l.* to see this engagement performed. Both Sentleger and the lord chancellor then accompanied Desmond to the town of Kilmallock, a place where no deputy

of the king had set his foot for a hundred years before. Here the earl most hospitably entertained them, taking occasion, during the few days they passed with him, to give such able and valuable counsel for the reformation of Ireland, as filled these two lords with admiration; and, in a letter to the king from Sentleger, recounting the transactions just mentioned, the once dangerous, perverse, and outlawed Desmond is described as 'undoubtedly a very wise and discreet gentleman.' Accordingly, without even waiting the royal sanction, he was sworn a member of the king's council."

*Lives of the Queens of England, from the Norman Conquest; with Anecdotes of their Courts.* By Agnes Strickland. Vol. I. Post 8vo. pp. 378. London, 1840. Colburn. In her preface Miss Strickland complains, and apparently with reason, that, having announced a work under the title of "Historical Memoirs of the Queens of England" so long ago as August 26th, 1837, and having been prevented from promptly following up her purpose by a long and dangerous illness, the title "was appropriated by another writer, and under that very title memoirs have been published of some of the queens whose biographies, in regular and unbroken succession, are comprised in the present series of the *Lives of the Queens of England*." We always dislike such poaching practices, and regret extremely that they are so prevalent among the lowest publishing manoeuvres of our day. But whatever may have been the purposed anticipation of our author's design, the preceding work is so different from hers that we do not think it either ought or can interfere with its success. There is an entireness about the production before us which is much in its favour; and as far as we may judge from a single volume the execution is equal to the conception. Great pains have been taken to make it both interesting and valuable, and the author frankly says:—

"Feeling myself thus charged, by each and every one of the buried queens of England, whose actions, from the cradle to the tomb, I was about to lay before the public, I considered the responsibility of the task, rather than the necessity of expediting the publication of the work. The number of authorities required, some of which could not be obtained in England, and the deep research among the Norman, Provençal, French, and monkish Latin authors, that was indispensably necessary, made it impossible to hurry out a work which I hoped to render permanently useful. The principal part of the work being now written and in types, and the whole in an advanced state, I have acceded to the wish of my publisher for its issue in monthly volumes, which will appear in regular chronological succession. As it has been one of my principal objects to render the *Lives of our Queens* a work of general interest to every class of readers, I have modernised the orthography of extracts from ancient authors, and endeavoured as much as possible to avoid prolix and minute details, on matters more suited to the researches of the antiquarian than to volumes which, I would fain hope, may find a place in the popular and domestic libraries of their day. The introduction contains brief notices of our ancient British and Saxon queens. Their records are, indeed, too scanty to admit of any other arrangement. Yet a work professing to be the history of the female royalty of our country would have been incomplete without some mention of those princesses. The biographies of the queens of England commence, in their natural order, with the life of

Matilda, the consort of William the Conqueror, the first of our Anglo-Norman queens, and the mother of the succeeding line of kings, whose dynasty, in the person of our present sovereign lady Queen Victoria, occupies the throne of England. Independently of her important position among the queens of England, the incidents of the life of Matilda are peculiarly interesting, and it affords me much pleasure to make her better known to the English reader; since the rich materials of which her memoir is composed are chiefly derived from untranslated Norman and Latin chronicles. The life of Berengaria, the crusading queen of Richard Cœur de Lion, will also for the first time be presented to the public, in the second volume of this work, with a portrait in her bridal costume. The memoir of Isabella of Valois, the virgin widow of Richard II., with whose eventful history some authors appear little acquainted, will be included in these biographies. The memoir of Margaret of Anjou contains a portion of her life which is at present unknown to English historians—the details of her childhood and early youth: these are derived from the most authentic sources, and comprise many new particulars, both of her personal and public life as queen of England, and the mournful epoch of her widowhood. Some curious incidents connected with the life of her unfortunate daughter-in-law, Anne of Warwick, afterwards the queen of Richard III., which will be found in her memoir in this work, will, I trust, tend to throw additional light on the brief and barren records that have hitherto appeared of this hapless lady. The life of Catherine Parr will, I venture to hope, form an attractive portion of one of my succeeding volumes of the *Lives of the Queens of England*;—my ancestral connexion with that queen affording me some peculiar facilities as her biographer."

This is a fair account and estimate of the work as far as it has gone, and therefore we are ready to give credit for its future research and talent. The present part contains the lives of the queens of the Conqueror, Henry I. (two, Matilda of Scotland, and Adeline of Louvain), Stephen, and Henry II. The first involves much of the common and known history of the male relatives of her majesty; and, indeed, this remark must apply to nearly the whole series, since the public acts and personal conduct of women cannot supply much, in a distinct and separate form, to be recorded by the historian; and, except in the rare cases of queens reigning in their own right, their stories are only part and portion of the general annals. Even Matilda, whose rule in Normandy, whilst her husband was engaged in the subjection of England, might be considered an individual sovereignty, has not furnished much of importance or novelty to the pen of her biographer. The difference is more in the manner of treating the subject than in the matter: for instance:—

"Matilda inheriting from her father, Baldwin of Lille, a taste for architecture, took great delight in the progress of these stately buildings, and her foundations are among the most splendid relics of Norman grandeur. She was a munificent patroness of the arts, and afforded great encouragement to men of learning; and co-operated with her husband most actively in all his paternal plans for the advancement of trade, the extension of commerce, and the general happiness of the people committed to their charge. In this they were most successful. Normandy, so long torn with contending factions, and impoverished with

foreign warfare, began to taste the blessings of repose; and, under the wise government of her energetic sovereign, soon experienced the good effects of his enlightened policy. At his own expense, William built the first pier that ever was constructed at Cherbourg. He superintended the building and organisation of fleets, traced out commodious harbours for his ships; and in a comparatively short time rendered Normandy a very considerable maritime power, and finally the mistress of the Channel. Under his auspices, the wine-trade, too, which had been suffered to fall into decay, revived; and the wines of Normandy, which were considered by the luxurious Romans so excellent that they were immortalised by the pen of Horace, regained some portion of their ancient fame, and became once more a source of national wealth and prosperity. Meantime, the domestic happiness which William enjoyed with his beautiful duchess appears to have been very great. All historians have agreed that they were a most attached pair; and that whatever might have been the previous state of Matilda's affections, they were unalterably and faithfully fixed upon her cousin from the hour she became his wife, and with reason,—for William was the most devoted of husbands, and always allowed her to take the ascendant in the matrimonial scale. The confidence he reposed in her was unbounded; and very shortly after their marriage he intrusted the reins of government to her care, when he crossed over to England, to pay a visit to his friend and kinsman, Edward the Confessor. By his marriage with Matilda, William had strengthened this connexion, and added a nearer tie of relationship to the English sovereign; and he was perhaps willing to remind the childless monarch of that circumstance, and to recall to his memory the hospitality he had received, both at the Flemish and the Norman courts, during the period of his adversity. Edward 'received him very honourably, and presented him with hawks and hounds, and many other fair and goodly gifts,' says Wace, 'as tokens of his love.' The young Duke William had chosen his time for this visit during the exile of Godwin and his sons; and it is probable that he availed himself of their absence to obtain from Edward the promise of being adopted as his successor to the English throne, and also to commence a series of political intrigues connected with that mighty project which fourteen years afterwards he carried into effect. In pursuing the broad stream of history, how few writers take the trouble of tracing the under currents by which the tide of events is influenced! The marriage of Tostig, the son of Godwin, with Judith of Flanders, the sister of Matilda, wife of William of Normandy, was one great cause of the treacherous and unnatural conduct on his part which decided the fate of Harold, and transferred the crown of England to the Norman line. During the period of their exile from England, Godwin and his family sought refuge at the court of the Earl of Flanders, Tostig's father-in-law, from whom they received friendly and hospitable entertainment, and were treated by the Duke and Duchess of Normandy with all the marks of friendship that might reasonably be expected, in consideration of the family connexion to which we have alluded. Nine months after her marriage, Matilda gave birth to a son, whom William named Robert, after his father, thinking that the name of a prince whose memory was so dear to Normandy would ensure the popularity of his heir. The happiness of the royal pair was greatly increased by this event. In fact, nothing could exceed the

terms of affection and confidence in which they lived. They were at that period reckoned the handsomest and most tenderly united couple in Europe. The fine natural talents of both had been improved by a degree of mental cultivation very unusual in that age; and there was a similarity in their tastes and pursuits which rendered their companionship delightful to each other in private hours, and gave to all their public acts that graceful unanimity which could not fail of producing the happiest effects on the minds of their subjects. The birth of Robert was followed in quick succession by that of Richard, William Rufus, Cecilia, Agatha, Constance, Adela, Adelaide, and Gundred. During several years of peace and national prosperity, Matilda and her husband employed themselves in superintending the education of their lovely and numerous family, several of whom, according to the report of contemporary chronicles, were children of great promise.\*

This extract will exhibit the character of the work, and we have only to remark upon it, that the charge against other writers for not taking the trouble to trace the under currents by which events are influenced is rather ungracious, does not apply to the best historians, and is in a tone of feeling too obvious in other parts of the volume.†

Matilda Atheling, the first wife of Henry I., was the only princess of Scotland who ever shared the throne of a king of England. After the melancholy loss of her son William in the fatal white ship, it is stated her "only surviving child, the Empress Matilda, became King Henry's heiress-presumptive. She was the first female who claimed the royal office in England. The events of her life are so closely interwoven with those of the two succeeding queens, Adelicia and Matilda of Bonlogne, her contemporaries, that to avoid the tedium of repetition, and also to preserve the chronological stream of history in unbroken unity, which is an important object, we must refer our readers to the lives and times of those queens for the personal history of this princess, from whom her present majesty Queen Victoria derives her title to the crown of England."

Of Henry's second queen we are told,—

"What degree of happiness Adelicia the Fair enjoyed during the fifteen years of queenly splendour which she passed as the consort of Henry Beauclerc, no surviving records tell; but that she was very proud of his achievements and brilliant talents, we have the testimony of the poetical chronicler, who continued the history of Brute, from William the Conqueror through the reign of William Rufus. It appears, moreover, that the royal dowager employed herself during her widowhood in collecting materials for the history of her mighty lord; for Gaimar, the author of the 'History of the Angles,' observes, 'That if he had chosen to have written of King Henry, he had a thousand things to say which the troubadour called David, employed by Queen Adelicia, knew nought about, neither had he written, nor was the Louvaine queen herself in possession of them.' If the collection of Queen Adelicia should ever be brought to light, it would no doubt afford a curious specimen of the biographical powers of the illustrious widow, and her assistant, Troubadour David, whose name has only been rescued from oblivion by the jealousy of a disappointed rival in the art of historical poetry."

We pass over the wife of Stephen, and com-

\* We observe some perplexing typographical errors, as at p. 34, *Normandy* instead of *Norway*; and p. 132, "he who the sturdy Normans ruled," instead of *ruled*.

clude with a brief example from the memoir of Eleanor of Aquitaine:—

"The memoir of the consort of Henry II. commences the biographies of a series of Provençal princesses, with whom the earlier monarchs of our royal house of Plantagenet allied themselves for upwards of a century. Important effects, not only on the domestic history of the court of England, but on the commerce and statistics of our country, may be traced to its union, by means of this queen, with the most polished and civilised people on the face of the earth, as the Provençals of the twelfth and thirteenth centuries indisputably were. With the arts, the idealities, and the refinements of life, Eleanor brought acquisitions of more importance to the Anglo-Norman people than even that 'great Provence dowry,' on which Dante dwells with such earnestness.

She made frequent visits to England, and at last fixed her residence there during her son's absence. If we may judge of her, as a reigning monarch, by the wisdom of her choice of ministers, and the tranquillity England and Normandy enjoyed during the difficult times of her son's absence and imprisonment, we shall form a high opinion of Eleanor's abilities in government. The admirable manner in which she dispensed justice, so little known in the Norman dynasties, accounts for the domestic peace of England during her regency. Whilst she thus watched over the interest of her best-beloved son, Otho of Saxony, son of her daughter Matilda and Henry the Lion,† was the deputy of his grandmother in Aquitaine, where this great emperor first learned the art of government. Queen Eleanor, when thus arduously engaged as regent for her son, was approaching her seventieth year—an age when rest is imperiously demanded by the human frame. But years of toil still remained before her, ere death closed her weary pilgrimage in 1204; and these years were laden with sorrows which drew from her that pathetic alteration of the regal style, preserved in her letter to the pope, on occasion of the captivity of *Cœur de Lion*, where she declares herself

'Eleanora,† by the *corath* of God, Queen of England.'

In this instance, and in several others, traits of the subdued spirit of Eleanor are to be discovered in her charters; for the extreme mobility of her spirits diffused itself even over the cold records of state, when in bitter grief she subscribes herself, '*in ira Dei Regina Anglorum*,' and '*Eliénora misera et utinam miserabilis Anglorum Regina*.' But, when swayed by calmer feelings, she styles herself '*Eliénora*, by the grace of God, *humbly* Queen of England.' Eleanor of Aquitaine is among the very few women who atoned for an ill-spent youth by a wise and benevolent old age. As a sovereign, she ranks among the first of female rulers."

#### POOR JACK, NO. II.

THE continuation of Captain Marryat's *History of Poor Jack* is so naïve, and yet so interesting, that we have no hesitation in repeating the opinion we offered on his *début*, that the narrative possesses every quality which can promise to make it one of the best and most popular of the author's very popular productions. Jack, a mudlark at Greenwich, will be recog-

\* Tyrell. Our queen is the direct descendant of this princely pair, through the line of Hanover. Matilda, Eleanor's eldest daughter, died, soon after the death of her father, of a broken heart, owing to the misfortunes of her gallant husband.—M. Paris.  
† "Peter of Blois' Epistle."

nised by the thousands of white-bait eaters whom Lovegrove so luxuriously entertains at the Crown and Sceptre. Jack in the snow-storm is a most interesting figure; and Jack receiving the earliest instructions from the worthy old pensioner, Anderson, gives promise of a fine variety of character, in which the better part, and the good effect of virtuous inculcations, will prevail over the ill example and reckless hardihood of preceding years. As the latter subject has exercised the pencil of Stanfield, and is one of the three engravings which accompany this part, we have much pleasure in presenting it to our readers. We

do not think it is cut in the highest style to which the art has risen, but for original conception, beauty, truth, and expression, it appears to us to be quite equal to the high reputation of the artist,—the first marine painter in the world. It is, indeed, a touching picture, noble in its simplicity, and comes home to the heart.

We have returned to the publication chiefly on account of our admiration of it; and shall therefore not whisper a word about Jack's father's tail, its barbarous cutting off, and the signal punishment of his lady's-maid-mother for an offence so contrary to every rule of naval discipline, and so abhorrent to the service.

propagated, reflected, refracted, and polarised, precisely as light is. It also collates the evidences and views of most of the experimenters and writers on electricity, even the latest of Faraday, Harris, and Becquerel. To this latter portion of the first edition six chapters have been added. Dr. Thomson's work will be valuable, and we strongly recommend it to the student. The Doctor, however, we find guilty of a grievous error; but one of omission, not commission. He has treated most fully of the sciences of heat and electricity, but he has not touched upon that of light. The triad should ever be maintained—heat, light, and electricity; their phenomena and laws, their similarities and dissimilarities, should always be studied together and compared; for we trust and expect that, in our own time, and notwithstanding the able supporters of the two-fluid theory of electricity, the three will be proved to be one—three effects of one cause—emanations from a single source—divided in action, united in rest. We hope that a third edition will speedily shew the willingness, equal to the ability, of Dr. Thomson to supply the omission.

*The Practical Chemist's Pocket-Guide; being an Easy Introduction to the Study of Chemistry.* By William Hope, M.D. Glasgow, 1840. M'Phun.

THE arrangement of this little work meets with our fullest approbation. The properties of the various elements, the manner of their combination, the decomposition and recombination of compounds, the preparation of materials employed in the arts, and the rationale of the product, are clearly described. We have met here and there with verbal inaccuracies, which a more careful "reading" at Glasgow should have excluded.

#### ARTS AND SCIENCES.

##### ROYAL GEOGRAPHICAL SOCIETY.

JANUARY 27th. Mr. Greenough, President, in the chair.—Read, 'A Report of the Third Expedition into the Interior of Guayana, including the Journey from Fort San Joaquim on the Rio Branco to Esmeralda on the Orinoco in the years 1838-9,' by Mr. R. H. Schomburgk. On two former expeditions Mr. Schomburgk had examined the rivers Essequibo, Corentin, and Berbice; on the present occasion, setting out from George Town, Demerara, in September 1837, he explored the Essequibo to one of its sources, in  $0^{\circ} 41'$  north latitude, and crossed the equator into the parallel of  $0^{\circ} 15'$  south; returning thence to Pirara, he crossed the Brazilian frontier and descended the Rio Branco to examine the range of the Carumá Mountains on its eastern bank; on his return from which, he passed the rainy season of 1838 at Fort San Joaquim, where he experienced every civility and assistance from the Brazilian commandant, Don Pedro Ayres. "Quitting this part on the 20th September, 1838," says Mr. Schomburgk, "we ascended the rivers Takutu and Mahu in a north-easterly direction, about eighty miles to Pirara, a Macusi village on the southern shore of the Lake Amucu, whence, after a stay of a few days, we set out on our journey to the far-famed mountain of Roraima, the wonder of the country, on the 8th October. Traversing the savannah to the northward, we crossed the Mahu, and entered a mountainous country, through which we travelled for about 100 miles in a western direction, crossing numerous streams, and the large river Cotinga in  $4^{\circ} 11'$  north latitude, where it was still ninety yards wide, with a depth of about seven feet, and

#### MISCELLANEOUS.

*An Outline of the Sciences of Heat and Electricity.* By Thomas Thomson, M.D. 8vo. pp. 585. London, 1840. Baillière.

IN almost every modern work on chemistry there is more or less space devoted to the exposition of the nature and effects of these two Agents of Nature: there are also many separate and valuable publications which afford data for the several doctrines of heat and electricity; but few comprise the whole of the more important

experiments and calculations upon which their laws, so far as they have been laid down, are established. The *Outline*, in a great measure, supplies the defect. It embraces all the topics hitherto discussed in relation to these sciences, and conveys a good idea of their present state. It extends to the recent researches, and includes the very important facts ascertained by Melloni and by Professor Forbes; the diathermic and athermic property of bodies; polarisation of heat, &c.; shewing that heat is

flowing to the S.S.E. Nearly twenty miles more to the westward, I measured the highest point of the Mairari mountains, which rose 2820 feet above the savannah, or about 3400 above the level of the sea. Our course now turned almost north, and travelling ninety miles in this direction, and gradually ascending through a very rocky and difficult country, inhabited by the Arecuna Indians, we reached the foot of the range of sandstone mountains, of which Roraima is the highest, on the 27th October, and took up our quarters at the Indian settlement of Arawayam. This remarkable mountain-group extends twenty-five miles in a north-west and south-east direction, and rises to the height of 5000 feet above the table land from which I measured it, or 9500 above the sea, the upper 1500 feet presenting a mural precipice more striking than I have ever seen elsewhere. Down the face of these mountains run numerous cascades, which eventually form tributaries to the three great rivers of the northern half of South America;—namely, the Amazons, the Orinoco, and the Essequibo. Owing to its great height the mountains were usually covered with clouds, but for an hour before and after sunrise on the 3d November, I had a glorious view of this magnificent and picturesque group, which far surpasses any other to be met with in the region of Guayana. Near the foot of these mountains I found, among other beautiful plants, an *Utricularia*, a *Sarracenia*, a *Cypripedium*, and a *Cleistes*, with a deep scarlet flower and purple stem. Roraima lies in 5° 10' north latitude, 69° 48' east longitude, a geographical position of much importance towards clearly understanding the hydrography of this portion of South America. Retracing our steps to the southward, we continued in the same direction twenty miles further, when we issued from the mountain chain, and, crossing the Xuruma, continued over the savannah as far as the Maruwa, flowing to the S.E., which we also crossed, and travelled more to the S.W. for about sixty miles. At twelve miles from the spot where we crossed the Maruwa, on the banks of the river, are some remarkable boulders of granite, piled up in a heap, to the height of 200 feet, on which are similar hieroglyphic figures to those that I had already found, both on the Essequibo and the Corentin, and which may be traced in the east and west direction, for a distance of 600 miles, in this portion of South America. On the 4th December, we reached the river Purima, flowing from the westward, in long. 61° 45' W.; and, embarking the whole party in two coorials, we commenced the toilsome ascent of the stream against a series of rapids, making a progress of only a few miles a day. The river is here more than 300 yards wide. About ten miles to the northward of our point of embarkation, a group of picturesque mountains rise 3000 feet above the savannah. Thirty miles beyond, we reached Purumami, or the great cataract of the Parima, which, here narrowed to fifty yards, precipitates itself over a ledge of rocks, forty-five feet high, into a basin only ten yards wide, whence, at the time we visited it, the stream again escaped over a wall of rock twenty-five feet high, thus making a cataract of seventy feet. This, as may be imagined, was an insurmountable barrier to boat navigation, and we were obliged to unload our coorials, and transport them and our baggage over hills 350 feet high; and launch the boats again on the stream, which, as we continued to ascend for a distance of many miles, was impeded by rapids. Sixty miles further, in a westerly direction, the

river turned to the N.W., and entered a more mountainous tract. Here, in 63° 20' W. long. all existing maps place the source of the Parima, which we found to be a fine stream, still 290 yards wide; shortly after we quitted it where it takes a south-west turn, and ascending the Neickata for about twenty miles, we abandoned our coorial to cross some mountains which separate this stream from the Merewari, on which we embarked on the 1st January, 1839, and continued our journey to the northward. Our new-year's fare consisted of the cabbage-palm and water—our bread was all expended, and little or no game was to be procured. To add to our ills, I was seized with a bilious fever, which confined me for several days. As we descended the river, we met with the Guinai tribe of Indians, who speak a different language from any other we had hitherto seen. Jan. 15.—Quitting the Merewari for a western tributary, we ascended the latter to its source in the Sarisharinima mountains, a well-wooded range of sandstone, extending east and west in the parallel of 4° 30' N., and rising nearly 4000 feet above the plain. From this point we turned directly to the S.W., and again crossing the Merewari (which here describes almost a circle fifty miles in diameter), continued over a mountainous country, inhabited by Mayong Kong, and Maui Indians; the fatiguing nature of this tract I can hardly describe; no sooner had we ascended one mountain than another rose to view; and carrying heavy loads, and short of provisions, for a distance of upwards of 100 miles, some idea may be formed of it. Jan. 31.—We this day entered the basin of the Orinoco—all the streams we cross flow southward towards that river—the parallel of 3° 30' N. is in this part the line of separation of waters. I had now every hope of realising one of my great objects in this journey, namely, to reach the source of the Orinoco; but we found, on arriving at an Indian settlement, on the following day, that the Kirishanas which inhabited that part of the country, were at war with the Mayong Kong; and it was in vain that I offered every bribe I could think of to induce them to accompany me; nothing would be listened to; and I was reluctantly obliged to turn my steps to the northward, to continue the journey to Esmeralda. Yet I have been enabled so far to ascertain the position of the sources, without any material error, as all the Indians agreed in stating them to be at the foot of some mountain which they had particularly pointed out to me, distant only fifteen miles. It is remarkable that the Kirishanas would appear to be the same tribe whose hostility prevented Baron Humboldt from attaining the sources of this river in 1800. Retracing our steps to the northward, as far as the parallel of 4° N., we turned direct to the west, and crossing numerous streams, and by a mountainous country reached the banks of the Parima, a northern tributary of the Orinoco. In the course of these last fifty miles, we crossed the elevated table-mountain of Warima, of syenite veined with quartz, which rises 3000 feet above the valley, and abounds in beautiful plants, *Orchida* a *Tillandsia*, a splendid *Utricularia*, and thickets of the Manicou Palm. On descending from this plateau, we heard, at a short distance from our path, the twittering noise peculiar to the splendid bird known by the name of the Rock Manakin, or Cock of the Rock (*Rupicola elegans*); and on approaching cautiously, we saw assembled, on a bare patch of ground, about twelve of these birds strut-

ting about, and displaying their brilliant orange-coloured plumage in the light of the morning sun. Descending the Parima, which we found full of rapids, and obliged continually to unload our coorials, we at length, on the 21st of February, entered the long-looked-for Orinoco, and glided down its stream, here more than 500 yards in width. On the following morning we started at daylight, all expectation to reach Esmeralda. Light fleecy clouds hung over the mountains of Duida; but they vanished as the sun rose, and, for the first time, we had a full view of its magnificent rocky cliffs, brought out in bright relief from the dark masses of shadow behind them. As we approached a fine savannah, extending to the foot of the mountains, a small village and a fine convenient landing-place assured me that this was Esmeralda. With what feelings I hastened ashore I need not describe; my chief object was accomplished; and our observations, begun on the shores of the Atlantic, at Demerara, were thus connected with those of Humboldt at Esmeralda. The alcalde came forward to receive us with every attention and offers of assistance, which our emaciated forms and tattered dress expressed, more strongly than words, how much we stood in need of. Nine-and-thirty years had now elapsed since Alexander Von Humboldt visited Esmeralda from the west, and found, in the most solitary and remote Christian settlement on the Upper Orinoco, a population of eighty persons; this number had now dwindled to a single family,—a patriarch with his descendants; and many of the houses were far advanced in decay. Yet Nature remained the same. Duida still raises its lofty summit to the clouds; and flat savannahs, interspersed with tufts of trees, and the majestic Murwita Palm, stretched from the banks of the Orinoco to the foot of the mountains, and give to the landscape that peculiar beauty which so delighted Humboldt when first he viewed Esmeralda. A ridge of heaped-up boulders of granite, representing the most singular forms, occupies the foreground of the picture; some pious hand has planted a cross on the highest point. Its airy form stands out in bold relief from the blue sky as a background, and heightens the picturesque appearance of the surrounding scenery. It also reminds us, that though nature and man appear in a savage state, there are still some in this wilderness who adore the Deity, and acknowledge a crucified Saviour. The highest point of the Cerro Duida was found to be 7155 feet above the savannah, or 8286 feet above the level of the sea, which agrees so nearly with the measurements of Baron Humboldt as to make it appear accidental. The lower part of the mountain, to the height of 3000 feet, is of granite, but the whole of the upper part is of quartzose sandstone. The north point is distant about ten miles from the village; further to the northward, and in the distance, are the mountains of Wataba Siru, Ekiu, and Marrawacca, the latter being the highest among them, and probably reaching an elevation of 10,000 feet above the level of the sea.

Mr. Schomburgk's paper was illustrated by a large map, on the scale of four miles to an inch, shewing his route throughout the whole of his journey,—a circuit, including his return, of upwards of 2000 miles; by various sketches of scenery; and a beautiful painting, the size of life, of his chief botanical discovery, the *Victoria Regia*; a large collection of geological specimens; the wourali poison; the blow-pipe; and various native implements. Three Indians also were present—a Macusi, a Warra,

and a Paravilhana, faithful and intelligent guides, who accompanied Mr. Schomburgk throughout his wanderings in South America.

#### GEOLOGICAL SOCIETY.

FEBRUARY 5. The Rev. Dr. Buckland, President, in the chair.—The following communications were read:—1. 'An Extract of a Despatch from Mr. Chatfield, Her Majesty's Consul at San Salvador,' dated October 10th, 1839, and communicated by direction of Viscount Palmerston. San Salvador is very subject to earthquakes, and from March to September last they were often felt; but not being unusually strong, they attracted no particular attention. On the 1st of October, at 2 A.M., a powerful shock was experienced; and at three o'clock a second, which nearly demolished the town. Between the 1st and the 10th of October, the shocks were repeated with alarming violence; and at the date of the despatch, not a house remained standing secure. The earthquake is supposed to have originated in causes immediately beneath the town; and the motion is considered to have been decidedly vertical, because places five or six miles from San Salvador had not been injured.—2. A paper by Mr. Austen, 'On *Orthocera*, *Ammonites*, and other cognate Genera; and on the Position they occupy in the Animal Kingdom.' The object of this memoir is to shew, that *Orthocera*, *Ammonites*, and other genera of chambered shells, were not external appendages of the animals by which they were formed, but internal; and, therefore, that they ought not to be placed with the nautilus in the *Tetrabranchiate* order, but in the *Dibranchiate*. Mr. Austen's reasons for considering that the shell was internal, are founded on its extreme thinness in some cases; on the contracted form of the mouth in several genera; in the last chamber being, in certain species (*Orthoceras pyriformis*), closed, with the exception of a passage for the siphuncle; on the impediments which the shape of the shell in the genera *Hamites* and *Scaphites* would present to the animal's progressive motion; on the liability of the shell in all genera, if external, to be injured, and its properties as a float destroyed; and on the difficulty which the animal, especially of the *Baculites* and other straight, elongated shells, would have in repairing an injury. In conclusion, Mr. Austen observes, that the great abundance of *Orthocera* and other chambered shells in the older strata, proves that animals of a high organisation thronged the seas at early periods of the earth's history.—3. 'The Introductory Memoir to the New Edition of the Geological Map of England and Wales, by G. B. Greenough, Esq., explaining the Principles upon which the Map has been constructed.' Having always felt the close and necessary connexion which exists between the outward forms of a country and its geological structure, Mr. Greenough, in preparing his new edition, has introduced, as far as the surveys of the kingdom have permitted, every requisite alteration. In the two southern, the eastern, and the two northern sheets, no material changes have been made in the topography, in consequence either of the original drawings having been, in part, reduced from the Ordnance surveys, or the want of more detailed documents than those used in preparing the first edition, or the geological structure of the country not requiring any alterations. To do justice, however, to the great mass of information recently obtained in Wales and the border counties, Mr. Greenough has conceived it necessary to have a new map

of the whole of Wales and the adjacent districts, constructed with scrupulous accuracy from the admirable maps issued from the Ordnance press; and he trusts, that the result will be approved, not merely by professed geologists, but by all who feel an interest in the progress of art, more especially when exerted in furtherance of science. Great attention has also been paid to the hydrography of the new sheets. With respect to subdivisions of formations which the progress of observation has rendered necessary, the principal are those connected with the green sand series, the Wealden, the lias, and the new red sandstone: but the chief changes are the divisions in Siluria and South Wales, first established by Mr. Murchison; and the adopting the classification recently proposed by Professor Sedgwick and Mr. Murchison for Devonshire and Cornwall. In the second part of the memoir, Mr. Greenough dwells upon the difficulties attending the colouring of a geological map. In the preparation of the new edition he has endeavoured to accommodate the colour of the pigment to that of the substance represented; to apply to substances mineralogically similar, similar tints; to substances mineralogically dissimilar, dissimilar tints; to place in juxtaposition those colours only which would either harmonise or contrast, as the occasion might require; to confine opaque colours to those parts of the map which are least charged with engraving; to reserve the most formidable colours for the smaller spaces; to denote marked differences in adjoining rocks by strong opposition of hue; to avoid spottiness; and, lastly, to apply the brightest colours to the centre, carrying them off by gradation towards the extremities. All these objects, Mr. Greenough adds, can rarely be attained, but all were taken into consideration before the colouring of any portion was finally determined. The difficulty of obtaining uniform tints by hand, as well as accuracy of extent, is much insisted upon in the memoir, and the necessity of employing artists of acknowledged skill and established character. Mr. Greenough likewise dwells upon the assistance which may be derived from employing shaded grounds, produced by lines or dots; and he is convinced that a combination of colours, with linear shadows, will afford a range of expression far greater than is likely to be required for any geological purposes: and that it will not be difficult, by the judicious application of this simple contrivance, to give to the geological map-maker the blessing, not only of an easy, copious, elegant, and precise, but also of an universal language.—4. 'On the Detrital Deposits between Lynn and Wells, in Norfolk,' by Mr. J. Trimmer. The detrital or superficial deposits of this district are divisible into two beds, and were accumulated, in Mr. Trimmer's opinion, not by ordinary and long-continued marine action over a district permanently submerged, but by sudden rushes of water over previously dry land. The upper deposit consists of ferruginous sand or loam, containing numerous chalk flints, fragments of red chalk, and many other rocks. The lower deposit is composed of chalk rubble, mixed in variable proportions with argillaceous and sandy matter; but in its purest state it is constituted of finely comminuted particles, resembling, at a short distance, chalk *in situ*. Near Lynn, it is formed of blue clay, enclosing fragments of chalk. It contains unabraded tabular flints, and organic remains derived from the chalk and oolitic series, but none assignable to the period when the detritus was accumulated. The depth of both deposits varies from

a few inches to many feet, and often at short distances. The chalk rubble is much furrowed on the surface, and vertical sand-galls penetrate its mass occasionally to within a few inches of the solid chalk. The furrows Mr. Trimmer ascribes to the action of currents of water, and the sand-galls to the whirling round of pebbles by eddies. The reasons for believing that the two deposits were not produced by long-continued marine action, but by sudden rushes of water, are derived from the slightly abraded condition of the materials composing them. In conclusion, the author suggests the importance of determining whether the superficial deposits of the north-west of Norfolk are the equivalents of those near Cromer, described by Mr. Lyell in his memoir read on the 22d of January.

#### ROYAL INSTITUTION.

FRIDAY, 31st January.—Dr. Grant, 'On the Structure and Growth of Corals,' contrasted the interest and importance of the mammalia, in relation to man, with the influence and value of the zoophytes, which, in such relation, sink into insignificance. But when, with elevated mind, the polygastric animalcules are viewed as parts of the material universe, as agents in the great economy of the world, they are raised from their low estate, they occupy a prominent position, and offer endless sources of admiration and wonder to the thinking being. These complex, and, in several cases, diminutive creatures, play an important part in the various changes in the superstrata of the earth. They are colossal in their effects, stupendous in their operations. The greater portion of the masses of our globe are due to their remains and products. Of late years, the researches and observations of Ehrenberg, Donati, and others, including those of Dr. Grant himself, have thrown considerable light upon the agglutinated masses of the siliceous, the limestone, and other rocks, upon the extinct poriferous and polypiferous animals, and upon the structure and functions of the like living species. At present, the sea swarms with animalcules, and would soon become a mass of solid matter, were there not an all-wise provision for their reduction, a partial destruction for the well-being of the whole; one curious source of which is, that zoophytes, although fixed, have been observed to feed upon each other. Dr. Grant proceeded to describe and illustrate by drawings the several characteristics of different varieties—the *Hydra*, the *Xanthidium*, the *Gorgonia*, &c., from the simple polypus to the more complicated aggregation of coraceous beings. He also enlarged upon the mode of their increase, the influence light has upon their offspring, ciliated gemmules swimming through the ocean seeking a place convenient for their perfect development. The topographical distribution of these half-animal half-vegetable creatures, he attributes chiefly to the influence of light; to which, although they have no organs of vision, they are highly sensitive. Lithophytes abound in the Pacific Ocean. They are exceedingly numerous, also, in the Mediterranean and Red Seas. In whatever point of view we behold the endless class of zoophytes, they present a remarkable feature in the range of creation; either as simple polypi, the link of the vegetable and animal kingdom, possessing only limited powers of motion, but extensive digestive capacities, feeding upon the putrefying contents of the waters; or as more complicated and more highly organised beings, with muscular and nervous systems, blood-vessels, &c. (both in the red and black corals, the circulation of the blood has been observed), straining the waters, and

depositing and accumulating the inorganic portions for the future habitations of man. The subject was well worthy the ability and enthusiasm with which it was treated by Dr. Grant.

## LINNEAN SOCIETY.

MR. FORSTER in the chair.—Read, a paper 'On the *Heliophora nutans*, a new Pitcher Plant from British Guiana,' by George Bentham, Esq. F.L.S. This plant formed part of an interesting collection of plants obtained by Mr. Schomburgk on the mountain of Roraima, situated on the borders of British Guiana. He found it growing on a marshy savannah, at an elevation of about 6000 feet above the level of the sea. It constitutes a new and very distinct genus of the curious natural family *Sarraceniacæ*, which, with this single exception, is entirely confined to North America.—The second paper read was 'On the Structure of the Tissues in *Cycadææ*,' by Professor Don, Libr. L. S. This remarkable family, which forms so interesting a part of the extinct vegetation of the earth, has been considered to be nearly related to the *Conifera*, with which it agrees in the structure and arrangement of its reproductive organs, but presents a striking difference in its habit, which approaches that of palms. Mr. Don considers it only as distinctly related to *Conifera*, and that the existing species constitute the remains of a class of plants which belong to a former vegetation.

## NEW ACCESS TO THE RIVER MERSEY.

THE following is an extract, of general interest and importance, from a most elaborate and scientific paper read, December 1839, to the Literary and Philosophical Society at Liverpool, by J. Brookes Yates, Esq. many years president of that Society, and late chairman of the Shipping Association, an extensive West India merchant and ship-owner, and a member of the Dock Trust Committee, Liverpool, on the rapid and extensive changes which have taken place at the entrance to the river Mersey, and the means now adopted for establishing an easy and direct access thereto. After adverting to the frequent representations of Capt. H. M. Denham, R.N. F.R.S., marine surveyor, and the results emanating from his surveys of Liverpool, the author proceeded, in detail, to state, "That Capt. Denham had been indefatigable in watching the shifting of the sands, and at length announced as his opinion, that a diagonal channel might be forced in aid of the ebb current, direct to the sea; this, he added, would afford a better channel than heretofore. The proposition was much opposed and jeered at as a vain attempt to oppose, in an open sea, the power of the elements eight miles seaward of the river's mouth; but at length he was enabled to commence operations at the close of last year over an area of three-quarters of a mile by one-third, and there now exists (the earliest by three hours into the port) a channel, admitting large ships, and recognised by authority as the Victoria Channel, through which, indeed, the greater part of the trade of Liverpool already passes, and seems destined to be the future great avenue to the port. So complete a success of the design is a sufficient recommendation to the conservators of those harbours which may resemble Liverpool, and where human efforts are likely, in any degree, to aid the great mechanics of nature!" Capt. Denham, we observe, is now engaged in giving opinions on other ports, and is rapidly carrying out his plans for deepening and straightening the Wyre navigation up to Port Fleetwood.

## PARIS LETTER: SUGAR, &amp;c.

Academy of Sciences, Jan. 27, 1840.

A HIGHLY interesting and important paper (in a commercial and economical point of view, at least) was read to the Academy, communicated by M. Peligot, 'On Improved Methods of Extracting the Saccharine Matter from the Sugar-cane.' From a long series of careful experiments, this young but able chemist has ascertained that the Martinique contains not less than ninety per cent of the saccharine juice termed *vesou* by the French planters; and that this juice, when manipulated on an improved principle, will yield eighteen per cent on the total weight of the cane in pure crystallised sugar. Hitherto, by the rude methods used in the West Indies for a long series of years, consecrated by local ignorance and prejudice, no more than from six to eight per cent of pure sugar could be extracted from the *vesou* juice; and the beet-root sugar growers in France had succeeded, by most laborious and expensive processes, in obtaining the same result from the juices of that root. M. Peligot, however, has been enabled to make his experiments on the West India sugar-cane, by having considerable quantities of it brought over to Europe in a dried state, as well as large quantities of the *vesou* juice,—all prepared according to a new and admirable method of preservation invented by M. Appert. The dried canes and juice, which were most carefully weighed and examined previous to exportation, have been found to lose only an imperceptible portion of their properties by the voyage; and the result of the experiment has been as above stated. The importance of this discovery in the commercial view will be immense. In the first place, from the advanced state of chemical knowledge in Europe, and the means of applying chemical processes at a cheap rate, the extraction of the crystallised sugar will be always effected much cheaper and better, according to this new plan, in Europe than in the West Indies. Hence it is intended (and government has already issued orders to that effect) to bring over an immense quantity of the dried cane and the *vesou* juice to France, in order that M. Peligot's method may be applied on the largest possible scale. This, if it come into general application, will entirely take the preparing of sugar out of the planters' hands, and will convert the islands into mere agricultural colonies; at the same time giving an immense development to the carrying trade from the ports corresponding with the West Indies. Next, on account of the greater quantity of sugar obtained from the cane at a cheaper rate, the beet-root sugar grown at home will be altogether driven out of the field, and the production of that article will probably be no longer attempted. Thus, while the French legislature is debating on the best means of reconciling the jarring interests of the colonial and indigenous sugar-growers, a chemist, in the retirement of his laboratory, cuts the Gordian knot, and effects a great commercial and social revolution. This discovery has produced a most intense sensation at Paris, both with the government and with the commercial and scientific classes of the community.

In the same sitting, M. Chevreul, professor and director of the dyeing establishment at the Gobelins, had a third memoir read on his 'Theory of the Contrast and Mixture of Colours.' With regard to the former part of his subject, some curious instances were adduced of the effect which colours placed in juxtaposition have on each other. One of the most interesting was that of the way to produce

the effect of silver in a pattern with a green ground. If the object to be coloured as silver was left purely white and grey, the effect could not be produced, and it would look quite dead, and any thing but metallic; whereas if a slight admixture of green were made with the white, the silvery effect would be at once attained. An instance of this was exhibited to the Academy, where a green border with silver vases on it had all the appearance of a bright and silvery whiteness strongly contrasted by the dark green; but on a piece of white paper being applied to it, so cut as to hide all the green part and to let only the vases be visible, these ornaments were immediately seen to be of a very decided green colour. This is accounted for on the well-known fact, that the mixture of the three primitive colours, red, blue, and yellow, will produce black or grey; and that part of the grounding colours in the border in question, which in reality appeared in the white of the vases required to be *harmonized* or *compensated* by another portion of the green before the eye, could accommodate itself to the whole. M. Chevreul explains, on similar principles, the effect of the blue used by laundresses in linen giving a white effect to the eye—on account of the linen, in reality, possessing some red and yellow rays in it, and requiring them to be neutralised or compensated by the third primitive colour.

Another very important memoir was laid before the Academy from M. Bontemps, director of the great glass-houses at Choisy-le-Roi, near Paris (a place well worthy of a visit), 'On the Manufacturing of Flint-glass for Optical Purposes.' An historical account was given in this memoir of the efforts of various manufacturers in France and England, and elsewhere, to produce flint-glass free, or as free as possible, from streaks, bubbles, and other defects, for lenses of large dimensions. M. Guinant, senior, succeeded better than any body else in manufacturing glass of this kind; but that gentleman died without having divulged the secret of his process even to his own family. It is known that he used to supply the workshop of the celebrated Fraunhofer, of Munich, with large objective glasses of the greatest purity and value. Still he had never produced a lens of more than thirty centimeters in diameter. M. Bontemps, having purchased from the heirs of M. Guinant a few imperfect receipts, gave himself up to a long series of experiments, and now communicated the result of his labours to the Academy without any reserve. It appears that the materials used by him are as follows:—Sand, 100 kilogrammes; deutoxide of lead, 100 kilos; subcarbonate of potash, 30 kilos. These produce a flint-glass, the density of which varies from 3.5 to 3.6. The main secret of the proceeding is the stirring up of the fluid vitreous substance while in the furnace,—the *brassage*, or brewing of it, as M. Bontemps expresses it,—with an earthen cylinder of the same material as the smelting pot. After various precautions fully detailed in the memoir, this cylinder, closed at the lower end, is introduced at a white heat into the metal; and an iron rod, heated red, is then put inside the cylinder, and is made by hand to give the cylinder the proper motion for thoroughly stirring up the fluid mass, the rod being changed from time to time. This takes away all streaks from the glass; and a clever method of suddenly effecting a slight cooling of the furnace, by instantly covering the fire-grate with coal a foot thick, causes all the air-bubbles to rise in the metal and disappear. It is found that, by this process, masses of flint-glass of

any size may be made, and that all the defects are driven to one part of the mass, so that the remainder is exceedingly pure; and, as M. Bontemps says, objective glass of fifty or sixty centimetres (from eighteen to twenty-four inches) diameter may be cut out of them. The ingredients of his crown-glass are, white sand, 100 kilos; subcarbonate of potash, 35 kilos; subcarbonate of soda, 20 kilos; chalk, 15 kilos; arsenic, 1 kilo.

M. Dumas took occasion to express his full assent to M. Arago's view of the discovery of the composition of water attributed to Priestly, in his "Historical Eulogium of Watt," in contradiction to the statement of Mr. Vernon Harcourt upon this topic. He considered the latter gentleman to be lying under an erroneous misconception of some of Priestly's statements; and a letter was read from that great chemist to Lavoisier, dated 10th July, 1782, from which it appeared that the former distinctly admitted inflammable air or hydrogen to be the same as the phlogiston.

Some large fragments of the fossil remains of the hyænodon found near Toulouse, and now in the museum of that town, have led to the inference that the remains of the great carnivorous animal of the gypseous strata of Montmartre, are to be attributed to the same species.

M. Tripiér has discovered, in the province of Constantina, on the road to Bona, that where the thermal springs of Hamman-mes-Koutin form a large natural reservoir, the permanent temperature of which, for more than 150 years, has never varied from 95° on the centigrade scale, fish—a kind of barbel—live in this almost boiling water, and enjoy themselves; while round the borders of the basin date-trees flourish most luxuriantly.

The first part of Vol. III. of Mr. Milne Edwards's "Histoire Naturelle des Crustacées" has recently appeared, and is quite equal to the former portions of this magnificent work. M. Thevenot has published an interesting work on the diseases of Europeans in tropical climates, particularly on the western coast of Africa.

M. Charvaz, bishop of Pignerol, has given to the world, a short time since, a curious and important work on the Vaudois, entitled "Recherches Historiques sur les Vaudois." His diocese contains a great portion of the Vaudois district; and, taking the Roman Catholic view of the subject, he endeavours to trace the first origin and progress of that religious sect. He is on the point of publishing a book of exhortations to that portion of his flock, in the hope of inducing them to adhere to the Roman Catholic creed.

M. Eichhoff, a learned orientalist, has recently published his "Parallèle des Langues de l'Europe et de l'Inde," in which, to prove the identity of the Indo-European tongues, he draws a comparison, or parallel, between the Sanscrit on the one hand, and the Greek, Latin, French, Gothic, German, English, Lithuanian, Russian, Gaelic, and Cymro-Britannic languages. At the end of his volume he has an essay on transcribing oriental alphabets in European characters.

An antiquarian of Caen has sent out a curious little book, on a good plan, entitled "Caen en 1786," in which he describes that interesting old city just as it was before the Great Revolution, when all its monuments were intact. This is an excellent hint for any local antiquarian in any city of Europe.

M. Didron has communicated to the minister of public instruction some Palimpsest MSS. brought by him from Mount Athos: they are shortly to be deciphered.

The Comité Historique des Arts et Monuments has resumed its sittings, and an active campaign against all Goths and Vandals is expected.

M. Pinel has given fifty new species of plants from Brazil to the Garden of Plants, and has again sailed for Rio Janeiro to pursue his researches in the forests of that country.

#### LITERARY AND LEARNED.

##### UNIVERSITY INTELLIGENCE.

CAMBRIDGE, Jan. 28.—The following degrees were conferred:—

*Honorary Master of Arts.*—The Hon. A. W. Noel, Trinity College.

*Bachelor in Divinity.*—Rev. N. Meeres, St. John's College.

*Bachelor in the Civil Law.*—Rev. R. Yonge, Catharine Hall.

##### ROYAL ASIATIC SOCIETY.

FEBRUARY 1st. Professor Wilson in the chair.—A paper 'On the Site and Ruins of the Ancient Town of Tammana Nuvera, in Ceylon,' by Simon Casie Chitty, Corr. Mem. R.A.S., was read to the meeting. Two circumstances concur to render the discovery of this ancient town interesting to us. The first is its name, from which the Greek and Roman writers undoubtedly derived the appellation they gave to the island of Ceylon; and the second is the remarkable resemblance displayed in its ruins to the Druidical remains, of times perhaps equally ancient, in our own island. The word *Tammana* is but a corruption of the Pali appellation *Tambapanni*, or Sanskrit *Tāmaravarni*, "copper-coloured," from the colour of the soil on which it was built, and meaning, as appears from a passage in the "Mahawanso," an ancient Pali book recently translated by the Hon. George Turnour, that the whole island was then so called:—"From the same cause this renowned land became celebrated under that name," vol. i. p. 60. From either of these two names, the *Taprobane* of the Greeks and Romans is easily derived. The word *Nuvera* appears to be merely a corruption of the word *Nagara*, a city. The town was founded in the middle of the sixth century before the Christian era, by Wijaya ("conqueror," Sansk.), the first in the list of the kings of Ceylon, whose history is given in the seventh chapter of the "Mahawanso." The site of the landing of Wijaya has been disputed by European writers; but a constant tradition has placed it near Putlam, on the western coast of the island; and this is now rendered certain by the discovery of the ruins, about ten miles to the north-east of that place, in a deep forest called Kandu-Kuli Maley. The country around the ruins, for many miles, presents an unvaried scene of jungle, and is the resort of elephants and other wild beasts. The ruins were not wholly unknown to the natives, who frequent the forest for the purpose of cutting timber, or gathering honey; but they took no trouble about them, except occasionally to dig for hidden treasure on their site. Last year, however, they were discovered by J. Caulfield, Esq., who was making an excursion to the forest with a party of friends. The ruins consist of thirteen groups of granite pillars; the remains of a *dogope*; a well; some tanks; two headless Buddhas; and several fragments of pedestals, bricks, potsherds, &c. &c. These ruins are scattered over a space of less than half a mile in extent, at a small distance from the river Meeyoa, which runs through the forest. All the groups of pillars are similar in form and arrangement, though varying in size: drawings of two of them were sent by the writer, and exhibited to the meeting. The largest pillar is stated to be from nine to ten feet in height; and in bulk, fourteen inches

by ten. They are supposed by the writer to be the remains of buildings, appropriated either to religious worship or to the residence of the king and his court; but he remarks, they are so low that it is impossible to imagine they ever supported a roof: but he thinks it likely they may have supported upper stories of timber. He also observed, that in nearly all the ruins found in different parts of Ceylon, pillars have been met with of similar character. No remains of private buildings are to be seen; and this the writer, with great probability, ascribes to the prohibition by Cingalese sovereigns of building houses of stone, except by persons of the royal blood, all other parties being compelled to live in thatched houses built of mud: and this prohibition was kept up till a recent period. The *dogope* is built of layers of brick and mud; but having been frequently explored, in the hopes of finding treasure, it is much dilapidated. The well, which was lined with hard stone, is almost filled up with the accumulated rubbish. The tanks are in tolerably good condition: they are small, and were, consequently, in all probability, not employed for the purpose of irrigation, but only for the domestic uses of the inhabitants of the city. A stone slab was found among the pillars, eight feet long, and three feet and a half wide. It is not left rough, as the pillars are, but is polished; and one edge has a carved moulding. This might have been the step of a temple, or a table to set idols upon; or, possibly, it might have been similar to the slabs placed as rude altars near Buddhist temples, and which are usually covered with flowers. Two figures of Buddha, formed of granite, were found in a sitting posture. The heads of both had been broken off, evidently by violence. One of these images still remains where it was found; the other has recently been removed to the town of Putlam. At the conclusion of this paper, the Director of the Society remarked upon the Druidical character of these ruins, which, though not upon so large a scale as those found in England, would suggest the idea of a similar origin. Such remains had been found in various parts of Ceylon; but it was remarkable that they had been seen in no other Buddhist country. The Secretary then commenced the reading of an interesting paper, by Sir John Macdonald, containing remarks upon Lient.-Colonel Evans's work, on the practicability of an invasion of India by Russia, which will be concluded at another meeting.

##### SOCIETY OF ANTIQUARIES.

MR. GAGE ROKEWODE, Director, in the chair.—Mr. Baylis exhibited a silver reliquary of most delicate and exquisite workmanship. Mr. Halliwell exhibited an impression from a seal lately found at Cambridge, and which he considered to be of the latter end of the fourteenth, or beginning of the fifteenth century. The reading of Mr. Godwin's, jun. paper, 'On the Ecclesiastical and other Ancient Buildings in Lower Normandy,' was concluded. Mr. Hartsborn communicated an account of Orford Castle, in the county of Suffolk, the property of the Marquess of Hertford, who preserves the ruin with most praiseworthy care; the paper contained observations on the different parts of that and other ancient castles, and their uses, and was illustrated by drawings and a ground-plan. A portion having been read, the remainder was postponed.

##### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

Monday.—Medical, 8 P.M.

Tuesday.—Medical and Chirurgical, 8½ P.M.; Civil

Engineers, 8 P.M.; Zoological, 8½ P.M.; Architectural, 8 P.M.; Society of Arts (Illustration), 8 P.M.  
 Wednesday.—Society of Arts, 7½ P.M.; London Institution, 7 P.M.; Medico-Botanical, 8 P.M.; Graphic, 8 P.M.; Literary Fund, 3 P.M.  
 Thursday.—Royal, 8½ P.M.; Antiquaries, 8 P.M.; Royal Society of Literature, 4 P.M.; Western Literary, 8½ P.M.  
 Friday.—Astronomical (Anniversary), 5 P.M.; Royal Institution, 8½ P.M.  
 Saturday.—Asiatic, 9 P.M.; Westminster Medical, 8 P.M.; Mathematical, 8 P.M.

## FINE ARTS.

## BRITISH INSTITUTION.

(Second Notice.)

THIS truly interesting exhibition of native talent and modern art has now been for some days open to the public, who, we hope, and have reason to believe, concur in the favourable opinion which we expressed of it in our last Number. We proceed to corroborate the testimony which we bore to its character more in detail. Those visitors to the Gallery, who, like Beattie's minstrel, are

"Fond of each gentle and each dreadful scene,"

will find ample matter for interesting contemplation. Of the latter class of subjects, one of the most striking examples is—

16. *View in the higher Swiss Alps after a Storm.* A. Calame.—The power of the elements is here exhibited under its most appalling and sublime effects, amidst mountains, rocks, and torrents, of majestic grandeur; while the hurrying clouds seem to threaten still further devastation. To give greater effect to the deep and leaden hue of the picture, the artist has judiciously introduced two of the peasantry gazing with horror at the scattered fragments of their late dwelling. The vivid colours of their drapery afford a fine contrast to the surrounding gloom.

144. *Sketched from Nature.* R. Rothwell.  
 "The head and front of my offending hath this extent."  
 We were strongly tempted, in passing to the head of the room, to commence our remarks with a notice of this beautiful and attractive specimen of "the human face divine." To fine features—to a purity of complexion seldom found in nature, and still more rarely reached by art—to rich, glossy, and waving tresses, it unites an expression which would induce us to add to the artist's quotation the language of another poet:—

"If to her share some female errors fall,  
 Look in her face, and you'll forget them all."

44. *Calais Pier: Sloop returning to Port.* E. W. Cooke.—It is a common saying that "comparisons are odious." So they may be in particular cases: but when the object is to remove rooted prejudice, we shall never scruple to make them; and we therefore ask, where can be found in the works of Vanderveelde, Monamy, &c. any qualities of art superior to those in this admirable performance, in which the pellucid character of water, the subtle essence of the atmosphere, and the firm texture of more solid matters, are treated with equal skill?

65. *The Looking-Glass.* R. Scott Lauder.  
 "Fool. For there was never yet fair woman, but she made mouths in a glass."—King Lear.

Though this Shaksperian passage savours somewhat of sarcasm, that is not a sentiment belonging to the character of the subject, which exhibits all that is graceful in the form, and elegant in the contour, of female beauty. It is also rich in colour and costume. The texture and the folds of the satin drapery have never been surpassed by Metzru, Terburg, or any other artist of the Flemish school. Indeed, the whole performance is worthy of the artist whose "*Bride of Lammermoor*" excited such

unqualified admiration at the last Exhibition of the Royal Academy.

9. *The Sisters.* Mrs. W. Carpenter.—A beautiful little domestic subject, grouped with great taste, and invested with all those qualities of fine art which have long distinguished the pencil of this fair artist.

1. *Young Roebuck and Rough Hounds.* E. Landseer, R.A.—Ignorance in woodcraft might lead many to imagine that this was the personification of a fable, and that the poor bleeding animal had been found by compassionate dogs, who were discussing and condemning the cruelty with which it had been treated, instead of having themselves been the perpetrators or accessories of the act. But thus do appearances deceive; and we are bound to acknowledge the correctness of the painter's knowledge on such subjects, as well as the great and characteristic skill with which he treats them.

90. *Farewell.* D. MacIse, A.R.A.—We have availed ourselves of numerous opportunities of expressing our admiration of the extent and versatility of Mr. MacIse's inventive powers, though their effect has sometimes, perhaps, been diminished by his gorgeous and florid execution; but we have here to congratulate him, not only on the deep pathos which he has imparted to the subject, but on the appropriate style and the skilful chiaroscuro displayed in it. Nothing can be more happily contrasted than the blending softness of the flesh of the female and of her ermined robe, and the firm and unyielding form of her steel-clad lover.

59. *Mercury and Argus.* J. M. W. Turner, R.A.—This performance is so similar in character and situation in the Gallery, to one by the same able artist in the last year's exhibition, that on viewing it our imagination was immediately carried back to that period. No one can deny the beauty and harmony of the colouring, its prismatic brilliancy, and poetic feeling; nor can any one pretend that such effects are not sometimes visible in nature. But may we venture to hint, that a too-constant repetition of them on canvass must eventually cease to excite attention and interest?

133. *Out of Tune.* T. E. Parris.—A singular title for a picture full of beauty, grace, and taste! The discord proceeds from the instrument of a figure in the centre; but it seems to have little effect on the gay group scattered through the piece, and with whom the character of the architecture and that of the summer foliage harmonise admirably.

2. *Entrée dans l'Eglise.* F. Goodall.—This young and promising artist has fully borne out the favourable opinion which we entertained and expressed of his talents when his picture of "*A Frosty Day*" appeared in the Gallery last year. An entrance to a church is frequently picturesque: it is so in the present instance. But the sentiment of purity and innocence conveyed by the child's dipping its beautiful hand into the holy water, is one of the greatest merits of the work; although its finished and cabinet style of execution may well recommend it to the eye of the connoisseur.

[To be continued.]

## NEW PUBLICATIONS.

*A Voice from a Picture.* By a Female Artist of the present day. 8vo. pp. 63. London, Booth.

THE object of this little book is an excellent one: it is to remonstrate against the neglect and prejudice under which modern art labours in this country. If any proof were wanting of

the fact, it might be found in the circumstance that the fair authoress, who is an admirable landscape-painter, and whose works on canvass have frequently been mentioned in the *Literary Gazette* with the praise to which they were entitled, should have any leisure for the employment of her pen, in the management of which we are obliged to confess she is not quite so skilful as in that of her pencil.

*Graphic Illustrations of "Vates; or, the Philosophy of Madness."* Part. I. By T. Landseer. Southgate.

FULL of wild imagination, and executed with great freedom and spirit.

## ORIGINAL POETRY.

## THE ROYAL BRIDAL.

Flowers for the Ring!—Pass through the ring,  
 Every charm that may happiness bring!  
 Blessings, that sweet from her subjects arise,  
 Prayers, and thanksgivings, that plead to the skies!  
 Love, with thy rose and beautiful wing,  
 Pass thy own heart through Victoria's ring!  
 Gifts for the Ring!—Our Queen's Bridal Ring;  
 Britain, thy soul-beaming Loyalty bring;  
 Circle the altar with hearts ever true,  
 Loyal hearts are the roses your Queen loves to view;  
 Flowers round her sceptre bid Love ever fling,  
 Love's sweetest crown is Victoria's ring!  
 Cheers for the Ring!—For ever, ye brave,  
 Bid the Union flag for Victoria wave!  
 As when Waterloo saw its red glory unfurled,  
 And with guns from Trafalgar proclaim to the world,  
 That our hopes round our Queen and her Albert still  
 cling,  
 And the Hearts of her realm are the Gems of her Ring!  
 Manchester, February 4th. CHARLES SWAIN.

## ANACREONTICA.

V.

Τὸ πόθος τοῦ τῶν Ἐγέρων  
 Μίσημι, κ. τ. λ.

WHILE the ruby tide we pour,  
 Hail to thee, Love's favoured flower!  
 As we quaff the juice divine,  
 Round our temples roses twine.  
 The rose, the matchless flower, I sing,—  
 The rose, the darling of the Spring!  
 In roses e'en the gods delight,  
 And Cytherea's offspring bright  
 With roses decks his flowing hair,  
 Dancing with the Graces fair.  
 With roses, then, my brows be bound,  
 And while I wake my lyre's soft sound,  
 Bacchus, near thy radiant shrine,  
 With my Love in dance I'll join:  
 The maid whose eyes flash heavenly fire,  
 Whose bosom swells with foud desire.

R. B. S.

## THE DRAMA.

*Adelphi.*—On Monday, one of the class of pieces formerly so popular at this little theatre was produced, and met with a reception which promised well for a long run. It is entitled *Poor Jack; or, the Wife of a Sailor*; and is at once pathetic, nautical, and broad farcical: and, *en passant*, we may remark, that the scenes in which the former predominates are somewhat of the longest—a fault easily remedied on the repetition of the drama. We seldom meddle with plots, so shall content ourselves by stating that the fact on which the drama is founded is one of much interest. The story is divided into four parts; and a lapse of two years is supposed to take place between the third and fourth. The principal characters are sustained by T. P. Cooke (*Jack Somerton*), whose part, though the foremost in the piece, is, to our minds, rather too much laboured in writing, but his acting is very excellent, and his return to these boards was warmly welcomed by the audience; Mr. Yates (*Mrs. Mendon*), a

Buenos Ayres trader, and a model of virtue and propriety; Mr. P. Bedford (*Sam Griffin*), a ruffian of the first water, and admirably acted throughout; Miss Fortescue (*Eleanor*, the heroine), pretty, graceful, and interesting; her appearance and acting were alike charming, and contributed much to the success of the drama. Mr. Cullenford, Holmes, E. H. Butler, King, and Mrs. Johnson, also had suitable characters. In parts three and four we have again the necessary parties (Cooke, Bedford, Cullenford, and Miss Fortescue) from Buenos Ayres in London; and, in addition, Tim Twopenny, a runaway barber, Mr. Buckstone; Hon. Mr. Flummary, Mr. Yates; Mrs. Col. Fantod, Miss P. Darling; and Becky, Mrs. Keeley. Among these four an *équivoque* is carried on, so entirely ludicrous, and so cleverly acted, as to call forth bursts of laughter from its commencement to the finale. It is a capitally managed relief to the more serious portions of the piece; and here also Mr. Maynard, Mr. J. F. Saville, Mrs. Nailor, Mrs. Fosbrooke, and others, have aught parts. The scenery of the earlier portion is generally new, and beautifully painted; the white squall and swamping of a fishing-boat, with ship in the distance, is managed with fine effect. The whole affair is got up with the usual ability of the Adelphi management; and will, doubtless, fill the house for many a night to come. In short, instead of one very popular and attractive drama, we may say that two such have been joined in one most *Adelphi-like*; the first redolent of the sea, always a favourite theme here, and the other full of fun and merriment, which would extort roars of laughter from the dumbest audience that ever assembled together.

The *Olympic Theatre* is announced to open to-night by Mr. Butler, whose *Hamlet* stamps him high among our leading tragedians. We observe that he has associated a very respectable company with himself in this adventure, including Jones, Forrester, Morris, Barnett, Mrs. Glover, Mrs. Anderson, Mrs. Garrick, and other popular performers.

The *Little Theatre* is also advertised to open on Monday with some affairs of Gramarye.

*Miss Chambers.*—We observe that this most meritorious young lady, and accomplished songstress, has an evening concert on Monday at the Albion Tavern, to support which, a variety of talent is announced. But we notice the circumstance rather to remind a sympathising public of the oppression and misfortunes which have forced Miss Chambers to these efforts of filial duty and affection. The disclosures of the monstrous abuses committed in the name of the law, which have ruined her father's property, and reduced him from affluence to beggary, form an irresistible claim to compassion; and, we trust, that in such a cause, the appeal to English hearts will never be made in vain.

#### VARIETIES.

*Dr. Blumenbach.*—The death of this celebrated naturalist at Gottingen in his eighty-eighth year is announced in the continental journals. His microscopic investigations made a great sensation many years ago, and his discoveries are widely quoted to the present day; when we observe this species of inquiry to have assumed so much importance that a Society has just been formed in London to carry on and consolidate its objects, under the presidency of Professor Owen, whose extraordinary skill and knowledge in similar pursuits have obtained

for him so high a position in the scientific world.

#### LITERARY NOVELTIES.

*In the Press.*  
(By Subscription.) *The History of the Jews during the Middle Ages: Translated from the French of M. Depping; with Additional Notes and Remarks by J. Murray Stevens.*

A reprint of *What Cheer*; or, *Roger Williams in Banishment. A Poem, by Job Durfee, Esq., with a Recompensatory Preface by the Rev. John Eustace Giles, Leeds.*

#### LIST OF NEW BOOKS.

Rain fallen, .855 of an inch.  
Edmonton. CHARLES HENRY ADAMS.

#### TO CORRESPONDENTS.

We are assured that the Baron Geramb's book, reviewed in our last, is a most genuine one, and not in any way made up. The translator we know to be a very honourable man; and it is also stated, that, in a very short time, the original work has gone through no fewer than five editions.—Since writing the foregoing, the French work (for the German Baron writes excellent French), in three 12mo. volumes, published at Paris by Leclerc and Co., has been shewn to us, and certainly removes any suspicion, if we could have entertained it, from the worthy and able translator, Mr. Shoberl. But, besides this, we see from the cover that the Baron is a most prolific author, for the following list of his works is given thereon:—*L'Unique Chose Nécessaire*, 1 vol. 12mo. avec Gravures.—*Lettres à Eugène sur l'Eucharistie*, 1 vol. 12mo. avec Gravures, 3<sup>e</sup> édition.—*Au Tombeau de mon Sauveur*, grand in 18mo. avec Gravures, 2<sup>e</sup> édition.—*Aspirations aux Sacrés Plaies*, 18mo. avec Vignettes, 6<sup>e</sup> édition.—*Litanies pour une Bonne Mort*, 18mo. avec Gravures.—*Les Mêmes, sans Gravure*.—*A Jésus Crucifié*, 18mo. avec Gravures et Vignettes.—*Marie au Pied de la Croix*, 18mo. avec Gravures et Vignettes.—*Litanies à l'Honneur de Jésus-Christ Souffrant, Modèle et Soutien des Affligés*, 18mo. avec Gravures.—*L'Eternité s'avance*, et nous n'y pensons pas, 1 vol. 12mo. avec Gravures.—*Une Journée consacrée à Marie*, 1 vol. 18mo. avec Vignettes. Such being the state of the case, readers may find much to please them in the Baron's genuine pilgrimage; his descriptions of holy places; and his curious mixture of extreme piety with shrewdness of observation, and a quiet vein of worldly humour.

A number of new and valuable works have issued from the press this week, to which we shall turn our immediate attention, as the lateness of their appearance has put it out of our power to give them due consideration for this Gazette.

#### ADVERTISEMENTS.

Connected with Literature and the Arts.

#### BRITISH INSTITUTION,

ALL MALL.  
The Galleries for the Exhibition and Sale of the Works of British Artists is open daily, from Ten in the Morning until Five in the Evening.

Admission, 1s. Catalogue, 1s.

Subscriptions are received at any of the Offices of the London and Westminster Bank, where Prospectuses may be had, and by any Member of the Committee.

#### ART-UNION.—The Subscribers of the

year 1839-40 are informed that for each Guinea subscribed they will receive in August next an Impression from an Engraving by Lucas of the Picture of R. Lee, R.A., purchased by the holder of the Prize of 1840. Subscriptions for the current year are received at any of the Offices of the London and Westminster Bank, where Prospectuses may be had.

#### THE WEDDING SUN.—Her Majesty's

Marriage is officially announced to take place on Monday next, the 10th instant. On this auspicious occasion "The Sun" will contain the beautiful Medallion Portraits of The Queen and Prince Albert, executed in the very first style of the art. The expense of producing and engraving them has been very great, but the charge will only be One Shilling. The Sun containing these portraits may be received by post in all parts of the kingdom. Parties in remote places can remit a shilling or two, half a sovereign, or a sovereign, for one penny, by the post; and their orders will be punctually attended to on Monday night. "The Sun" will also contain a full account of the august ceremony, with all particulars appertaining to so interesting an occasion. Orders for The Nuptial or Wedding Sun will be received by all News Agents and Postmasters throughout the kingdom, and at the S. Office, 118 Strand, London.—Wednesday, February 5th, 1840.

### REVIEW OF NEW BOOKS.

*Narrative of a Journey from Caunpoor to the Boorendo Pass in the Himalaya Mountains, &c., by Major Sir William Lloyd. And Captain Alexander Gerard's Account of an Attempt to Penetrate by Bekhur to Garoo, and the Lake Manasarowara: with a Letter from the late J. G. Gerard, Esq., detailing a Visit to the Shatol and Boorendo Passes, to Determine the Line of Perpetual Snow, &c.* Edited by George Lloyd. 2 vols. 8vo. London, 1840. Madden and Co.

PIONEERS through a region daily acquiring a greater degree of national importance, the accounts of these various toilsome, yet sublime journeys among the lofty Himalaya mountains, must excite a strong feeling of interest, not only in the minds of those connected with our Indian empire, but of every reader for whom the grandest scenery of nature possesses attractions, and the daring spirit of human enterprise furnishes a theme of curiosity and admiration. In the first of these volumes Sir W. Lloyd details the incidents of an extensive tour through this extraordinary country, and his narrative, under the glowing hand of its editor (his son, whose poetical productions have heretofore claimed encouraging notice in our pages), has in many parts risen into a style and tone of sentiment such as the view of the glories and wonders of the Himalaya is so well calculated to inspire. In his preface, speaking of the other portions of his work, Mr. Lloyd says, explanatorily and very touchingly:—

"It was with pleasure that I undertook the task of editing these volumes; I finish it in sorrow. But private grief is no subject for public information, and it will therefore be sufficient for me to say, that the valued author of the *Account of an Attempt to Penetrate by Bekhur to Garoo, and the Lake Manasarowara*, Captain Alexander Gerard, is now no more. From the fatigues he had for many years undergone, together with a fever, which, since his return to England, has periodically attacked him, his frame and constitution were shattered. It is only two or three months since that he had the usual return of his malady; but still he did not apprehend any immediate danger until the 12th of December, when he became alarmingly unwell, and expired in his native town of Aberdeen, on the 15th, having been only three days seriously ill. To speak in praise of the living too often resembles flattery; but no such imputation can be attached when we render justice to those who are voiceless to the interests of this world. In the preface I had formerly written, I had attempted to render justice to the merits of one brother, and little then did I dream that the same paragraph would enclose both! Yet what can be said? This is no place for a biography. I must therefore beg the candid reader to form his own estimation of my late friends from their productions. I feel a confidence in saying so, for I am sure that he will accord them that fame, that general fame, which is so justly their due. The late Captain Alexander Gerard corrected his *Narrative* purposely for this work, as it had formerly appeared merely in scraps, and imper-

fect. It is therefore an authentic document. The Letter from the late J. G. Gerard, Esq., was written upon the spot, and contains facts and results of much importance upon the isothermal lines of the Himalaya mountains."

It is not our intention to follow the route of Sir William Lloyd; and it will be sufficient for the illustration of his *Narrative* to select a few passages which may afford an idea of the whole, though, in doing so, we omit his description of Sikh Sirdars, &c., in consequence of having before us the more recent statements of Mr. Osborne:—

"Just before us is the razed fort of Soorujghur, upon a high part of the Malown range, and distant about three miles. It is 1100 feet above our tents, and 4927 feet above the sea. Serjeant Gordon passed us at this place on his way from Subahtoo to Malown. His wife was in a chumpala, or hill litter, which was carried by eight bearers. The chumpala, or, as it is more frequently called, the chumpala, is the usual vehicle in which persons of distinction, especially females, are carried, when travelling amongst these mountains. The body of it is a square or oblong frame, made of split bamboos, with a pentroof-top of the same material, and the whole is generally covered with white or red cloth. It is barely sufficient for a person to lie in. To the sides, at the bottom, two stout bamboo poles are fastened, which are twelve or more feet in length, by which it is carried in different ways by the hill porters, according to the nature of the road; and as the ascents and descents are very frequent and steep, a contrivance has been resorted to, in order to ease the labour of bearing it in one particular position. This is done by a cord tied across the poles at each end of the chumpala, in the centre of which cord also is fastened a shorter bamboo pole, which, being movable in every direction, forms an axle upon the shoulders of the bearers as they stand before each other, by which all sudden jerks are avoided, as it allows the body of the machine to sway to and fro. As the road happens to be either easy or difficult, eight, twelve, or sixteen persons are requisite for one chumpala, some of whom, in dangerous places, walk beside it, to steady it. The chumpalas which are used by females of distinction are covered with the finest scarlet broad-cloth, richly embroidered with gold or silver, and the ends of the bamboo poles are likewise ornamented with gilt knobs. They also shut close, to screen the person entirely from the sight of the inquisitive. There is another conveyance which is much more in use than the chumpala. This is the doolee. It is merely a hammock, fastened to a strong bamboo pole, and is carried upon the shoulders of two or four men."

"11th April, Bojoon or Pijoon, 9 m.—This is a small hamlet on the right bank of the Gumbur river, immediately below Malown. We returned to Rajpooora by the same route that we had traversed yesterday. The road was stony and bad, particularly near Belaspoor. From a spot on the way hither, close to the town, I threw a stone almost across the stream of the Sutluj; but the breadth of the river at Belaspoor is about 300 yards, and it is unford-

able. I purchased a goont, or hill pony, for forty-five rupees.

"17th April, Pinjore, 11 m., elevation 1900 feet.—We continued our march along the valley, which was more wooded than before, but the road was not so good. About 4f. from Buddeea we crossed the Sursa. It rained almost the whole way, and completely drenched all our party. We received very kind letters from our friends at Subahtoo, and also from Captain Lumsdaine, who, besides, sent us a dozen mules from Hurdwar. Thermometer: extremes, 70°, 66° Fahrenheit.—18th April. Halted. It rained all last night, and the greater part of to-day, but towards the evening, the weather having cleared up, we walked to a large well, which is resorted to as a place of worship by the Hindoos. There is nothing particular about it, being merely an old ruinous building, with images and shady trees. It is of great antiquity. We next proceeded to a most delightful place; it is a garden which has been laid out on the natural slope of the ground in six separate and successive terraces, one below another. A canal about ten feet wide, of the clearest water, runs through the centre. In this is a line of fountains extending from the entrance to the end, abundantly supplied with water from the hills above, which flows through the canal, and falls in chuddurs, or broad cascades, from terrace to terrace. Behind these crystal curtains there are recesses for lamps, which are lit during nights of festivity. Similar lines of fountains branch off on the right and left to other parts of the garden. In the centre is an artificial tank, and in the middle of it a small Mahal surrounded with fountains, which during the hot months must be a delicious retreat. A profusion of roses, with other flowers, shrubs, and handsome trees, ornament this beautiful spot. The gardens of Shalimar, at the Tanj Mahal, Secundra, Sirhind, have perhaps equalled this in profuseness of bloom or gracefulness of arrangement, but this surpasses them in the charms which Nature herself has bestowed: for from the Mahal there is an enchanting view, the valley on one side being closed by high mountains crested with dark green pines, and overspread with woods, rich fields, rocks, hamlets, and hill forts, while nearer heights covered with jungle of all shades, broken by shreds of culture, and dotted with the circular towers of gurhees, and numerous villages, partially hide it on the other side from the plains which are occasionally seen between the gaps in the range, and now covered with the ruddy golden haze of sunset. The valley itself is thickly wooded, although in parts there is cultivation, and it is besides richly diversified by the tall broken banks of the Kosilla which runs through it, adding a thousand smiles to this recreated Eden. In short, nothing is wanting that may give happiness to the mind, but the absence of that visionary and incoherent desire, which, when novelty is past, causes a void in the heart, and harshly convinces us, that although we are in the midst of beauty in this world, our creation is imperfect. These gardens were made by some Mahummedan, but are now, together with Pinjore, in the

possession of the Rajah of Putteala. They have become almost a wilderness, but I am happy to say that our friend the Sikh chieftain, Kurum Sing, is endeavouring to restore them to their former beauty.

The ascent of the Kunnaug is long and somewhat laborious. We were particularly struck to-day by the depth of the glens, which varied from 3000 to 5000 feet, and again occasionally traversed fine woods of oak and fir. There were numerous hamlets in the dells. Their inhabitants are almost as much out of sight as if they dwelt in Kamschatka. The most prominent objects were, on the left, the Shallee Peak with its temple dedicated to the Goddess Kalee, to whom formerly human sacrifices were offered; and on the right, the towering mass of the Sirgool.\* I loitered away half an hour in shooting, but only killed a chukore. I fired also at a jackal, the first wild quadruped which I have seen since entering the mountains. There are but few animals to be met with near the side of the road. We have seen eagles, white vultures, crows, maïnas, tomtits, hawks, cuckoos, chukores, pheasants, sparrows, and some other small birds, the names of which I could not ascertain, but of those which I have enumerated the number is small. Some of our party saw some kukkura, a species of deer. A large lizard, like a gosamp, was killed by the camp people. • • • 14th May, Wartoo.

—Yesterday evening there was a thunder-storm accompanied with hail. It was fearfully sublime. The huge clouds girdled with lightning rolled amongst the mountains, and the thunder burst so frequently that it seemed almost to crack the firmament, while the wind hurried whistling through the gloomy woods. The vapoury masses then lowered into the valleys beneath, and hid them from us, and the snowy Himalaya was all that we saw. Between was a surging ocean of clouds, through which rugged peaks arose, like enormous breakers. As the tempest passed, height after height towered majestically, glowing with the crimson sun-flood of the evening, and threw their large purpled shadows far and wide upon the dispersing clouds, and the dismembered ridges which peered above them. All became at last distinct, and the air was still. • • •

30th May, Koteghur, 20 m. 4 f.—We rode to the foot of the Gaut within five miles of Koteghur. The Sutluj was greatly swollen by the rapid melting of the snows, and rolled down the glen with an eye-straining velocity. Pine-trees, which had fallen into it, were hurled along with a swiftness that was surprising. We frequently watched one, and starting fairly, cantered as fast as our goons would go to keep up with it; but in vain, it always outstripped us. The races were ludicrous. Throwing off our upper clothes, and leaving the goons, we began the toilsome ascent. The sun blazed upon the side of the mountain, the air was breathless, and the heat was intolerable; we, however, gained at length the summit, and, passing the old fort of Joud-poor, descended through corn-fields and woods to a cool, cool stream, which runs below Koteghur, and plunging our heads into it, completely refreshed ourselves. From hence

\* "The name of the black goddess, to whom these human sacrifices were offered, was Narada, or Callee, who is exhibited in the Indian temples sacred to her worship with a collar, not composed, like that of the benign deities, of a splendid assemblage of the richest gems, but of golden skulls, descriptive of the gloomy rites in which she took so gloomy a delight. 'To her,' says Sir W. Jones, 'human sacrifices were anciently offered as the Vedas enjoined, but, in the present age, they are absolutely prohibited, as are also the sacrifices of bulls and horses.'—Maurice's *Indian Antiquities*, Dissert. 2, p. 181."

an ascent of a few hundred feet brought us, after traversing another pine-forest, to a more temperate region and to those we had left. After we had seen our friends and attendants, we were glad to rest a little; and, as our excursion to the Boorendo was the next principal object, we sat down and discussed the matter at some length. Sooraan, and the places we had already visited, furnished also a portion of our conversation. It was now evening, and the majestic view before us charmed us into silence. The nearer hills appeared like swelling shadows in an ocean of ethereal purple. As range upon range rose higher and higher, the tints grew more delicate and natural; and those upon which the sun still shone were vivid and instinct with brightness. Above them rose the massive yet airy deserts and peaks of eternal snow. There is nothing so soothing to the mind as the loveliness of creation combined with vastness and tranquillity. It was before us. As the sun declined, in one brief instant the whiteness of the Snowy Range vanished, and it appeared glowing in the majesty of glory, like an immeasurable and stupendous wilderness of rock of gold! Then as the sun sunk deeper, hue upon hue of the lesser ranges verged into uniformity: still the lofty pinnacles of the Himalaya shone in rich splendour. They too at length grew shadowy and indistinct, and were at last gradually obliterated by the all-presiding darkness of night. • • •

"13th June, Camp at the Leetee Torrent, 4 m. 4 f.—Early this morning the weather became clear, and I left my fellow-travellers in the tent, and determined to climb to the summit of the western peak, above the pass. I experienced much labour in this attempt, as the fragments over which I clambered were but moderately firm. However I persevered, and at length stood on the top. The sky was intensely blue, and of a receding vastness. The air was stirless, cold, and oppressively pure. From here I saw the snow-clad ranges of the further Himalaya, running from N.W. to E., an assemblage, as it were, of all the mountains of the world. To the N.E. the twin peaks of the Purgkeool, in Chinese Tartary, rose to the skyey elevation of 22,488 feet. It was distant fifty miles. Further to the east, and about ten miles from hence, I recognised Raaldung, one of the pinnacles of the Kaailas, whose height is 21,103 feet, while two others, from the same mass of splintered and bare pinnacles, were 19,990 feet, and 18,068 feet. The Kaailas group is above a hamlet called Rispee. Seven thousand feet below me was the glen of the Sutluj, filled with a glowing blue ethereal mist, and N.E., at the confluence of the Buapa with this river, distant nine miles, was the village of Broang. The descent to it from the Boorendo is by a gloomy ravine, the upper part filled with snow, the lower crowded with woods. But the object that riveted my thoughts was an immense pyramidal peak almost north, on the stupendous barrier of eternal snow beyond the Sutluj, near the Manerung Pass. It stood erect and alone in hoary majesty, like one of the superior powers of the host of white-robed pinnacles around it. The spot I was upon was a heap of decaying rocks, bound together slightly by a withered mossy soil, and a few abortive lichens. The gneiss blocks of which it was composed were very large. These masses are, as I have already mentioned, constantly breaking away from the firmer crags, and tumbling thundering into the abysses beneath. The snowy peak, to the west of the one I was upon, was separated by a frightful

chasm. It is a ghastly dislocation. The eastern summit, above the pass, is higher than the western, more precipitous and compact, but crumbling away, nevertheless, by the ceaseless gnawing of the frosts. The pass itself is about fifty paces wide, strewn with the shattered rocks which have scaled from its sides. The descent from it to the Sutluj is so steep, that we did not choose to venture upon the snow-bed, which fills a part of the ravine, lest we should have had an unnecessary slide of three or four hundred yards, with the toil of re-ascending. Looking, but it was not pleasing to do so, to the south, I saw the mountains near the Choor Palhar, and had it not been for the haze in that direction, I should have seen the distant plains. I sat down on the summit of the peak. I was alone, and how elevated! The prospect on all sides so vast, that it seemed boundless. Here, indeed, Desolation, veiled in mystery, and surrounded by invisible but dreadful ministers, reigned supreme, throne on the sepulchre of countless snow-storms. Above me was the deep splendour of the heavens, around me the winning beauty of serenity, beneath me the all-gorgeous magnificence of the world! I felt that I was among the lowest under the glowing sapphire footstool of the Beneficent. How infinite the mind! how finite the frame! The mind infinite, for it embraced easily the vision of the earth; the frame finite, for what was I compared with that which I beheld above, around, and beneath! The taught pride of human nature broke, and the heavenliness of humility was felt. Alas! why cannot all men smile when they pray; rejoice, when they meet; and, for the briefness of this existence, enjoy the gladness of creation? All that can make us happy has been bestowed on us, without scant or tithe, and the waters of life flow now from the cleared source. Even eternal life has been revealed from His hallowed lips! Away with the craft of worldly consecrations! Let man bow his stately form in humility to his Creator, and, in the steadfastness of confidence, trust to His paternal mercy, and rejoice in vitality! After these reflections, I arose, and bidding farewell to that distant realm of mountains, which I should never see again, descended slowly to my companions. Although the pass is within the limit of perpetual snow on this face of the Himala, we saw several small birds about it, one of which resembled that universal favourite, the robin-redbreast. I trust it was an excusable vanity, but I was very much pleased that I had been the first European who had ever stood on the summit of the western Peak of the Boorendo, as well as at having attained a greater elevation than Mont Blanc, besides having had a glimpse of the scarce known countries of the northern Himala."

(To be continued.)

*Sketches of Young Couples; with an Urgent Remonstrance to the Gentlemen of England (being Bachelors or Widowers), on the Present Alarming Crisis.* By the Author of "Sketches of Young Gentlemen." With Six Illustrations by "Phiz." Pp. 92. London, 1840. Chapman and Hall.

THIS *jeu d'esprit*, done in a very Boz-like spirit, and most Phiz-ically embellished, has been suggested by the concurrence of bissexile or leap-year and the Queen's marriage; which the writer seems to think fraught with dreadful threatening towards not only the supremacy but the independence of the male sex. How it may turn out we are unable to prophesy, but

we really must confess our opinion, that the masculine gender have had it so much and so long their own way, that the sense of justice must be in favour of trying a change, were it only to see how things would go on. Her Majesty is by law above Prince Albert; the ladies of the court are said to possess an influence superior to the lords and the legislature; and we are acquainted with a considerable number of private families and social circles where the same arrangement of power prevails. Why, then, should it not be general? Why endure the anomaly of two different and conflicting kinds of authority? Why are the Unmentionables for ever to domineer over the *Petties*? Since shirts of mail gave place to shirts of linen, there appears to be no ground for acting as if women could not make a shift to protect themselves, without crouching behind the panoplied steel of rough and stern warriors. Cavalry is not chivalry; and household dames are any where equal to household troops, the mothers of children to the best disciplined infantry. We cannot agree to this remonstrance, therefore, but on the contrary beg humbly to advise immediate and unrepining submission to the apparent decrees of Fate. Come what come may, let us yield to our duty, and "up with Petticoat Government for ever. Huzza!"

The couples of whom our author treats are "The Young Couple," "The Formal Couple," "The Loving Couple," "The Contradictory Couple," "The Couple who Dote upon their Children," "The Cool Couple," "The Plausible Couple," "The Nice Little Couple," "The Egotistical Couple," "The Couple who Coddle Themselves," and "The Old Couple;" and they all display considerable and acute observation. The manner in which the essays are written is lively and agreeable; and though the book is small, we are so much pleased with it that we shall offer no apology for taking a whole sketch as a sample of the rest:—

"*The Couple who Dote upon their Children.*"—The couple who dote upon their children have usually a great many of them: six or eight at least. The children are either the healthiest in all the world, or the most unfortunate in existence. In either case, they are equally the theme of their doting parents, and equally a source of mental anguish and irritation to their doting parents' friends. The couple who dote upon their children recognise no dates but those connected with their births, accidents, illnesses, or remarkable deeds. They keep a mental almanack with a vast number of Innocents' days, all in red letters. They recollect the last coronation, because on that day little Tom fell down the kitchen stairs; the anniversary of the Gunpowder Plot, because it was on the fifth of November that Ned asked whether wooden legs were made in heaven and cocked hats grew in gardens. Mrs. Whiffler will never cease to recollect the last day of the old year as long as she lives, for it was on that day that the baby had the four red spots on its nose which they took for measles: nor Christmas day, for twenty-one days after Christmas day the twins were born; nor Good Friday, for it was on a Good Friday that she was frightened by the donkey-cart when she was in the family way with Georgiana. The movable feasts have no motion for Mr. and Mrs. Whiffler, but remain pinned down tight and fast to the shoulders of some small child, from whom they can never be separated any more. Time was made, according to their creed, not for slaves, but for girls and boys; the restless sands in his

glass are but little children at play. As we have already intimated, the children of this couple can know no medium. They are either prodigies of good health or prodigies of bad health; whatever they are, they must be prodigies. Mr. Whiffler must have to describe at his office such excruciating agonies constantly undergone by his eldest boy, as nobody else's eldest boy ever underwent; or he must be able to declare that there never was a child endowed with such amazing health, such an indomitable constitution, and such a cast-iron frame, as his child. His children must be, in some respect or other, above and beyond the children of all other people. To such an extent is this feeling pushed, that we were once slightly acquainted with a lady and gentleman who carried their heads so high, and became so proud after their youngest child fell out of a two-pair-of-stairs window without hurting himself much, that the greater part of their friends were obliged to forego their acquaintance. But, perhaps, this may be an extreme case, and one not justly entitled to be considered as a precedent of general application. If a friend happen to dine in a friendly way with one of these couples who dote upon their children, it is nearly impossible for him to divert the conversation from their favourite topic. Every thing reminds Mr. Whiffler of Ned, or Mrs. Whiffler of Mary Anne, or of the time before Ned was born, or the time before Mary Anne was thought of. The slightest remark, however harmless in itself, will awaken slumbering recollections of the twins. It is impossible to steer clear of them. They will come uppermost, let the poor man do what he may. Ned has been known to be lost sight of for half an hour, Dick has been forgotten, the name of Mary Anne has not been mentioned, but the twins will out. Nothing can keep down the twins. 'It's a very extraordinary thing, Saunders,' says Mr. Whiffler to the visitor, 'but—you have seen our little babies, the—the—twins?' The friend's heart sinks within him as he answers, 'Oh, yes—often.' 'Your talking of the pyramids,' says Mr. Whiffler, quite as a matter of course, 'reminds me of the twins. It's a very extraordinary thing about those babies—what colour should you say their eyes were?' 'Upon my word,' the friend stammers, 'I hardly know how to answer,—the fact being, that except as the friend does not remember to have heard of any departure from the ordinary course of nature in the instance of these twins, they might have no eyes at all for aught he has observed to the contrary. 'You wouldn't say they were red, I suppose?' says Mr. Whiffler. The friend hesitates, and rather thinks they are; but, inferring from the expression of Mr. Whiffler's face that red is not the colour, smiles with some confidence, and says, 'No, no! very different from that.' 'What should you say to blue?' says Mr. Whiffler. The friend glances at him, and observing a different expression in his face, ventures to say, 'I should say they were blue—a decided blue.' 'To be sure!' cries Mr. Whiffler triumphantly, 'I knew you would! But what should you say if I was to tell you that the boy's eyes are blue and the girl's hazel, eh?' 'Impossible!' exclaims the friend, not at all knowing why it should be impossible. 'A fact, notwithstanding,' cries Mr. Whiffler; 'and let me tell you, Saunders, that's not a common thing in twins, or a circumstance that'll happen every day.' In this dialogue Mrs. Whiffler, as being deeply responsible for the twins, their charms and singularities, has taken no share; but she now relates, in broken English, a

witticism of little Dick's bearing upon the subject just discussed, which delights Mr. Whiffler beyond measure, and causes him to declare that he would have sworn that was Dick's if he had heard it any where. Then he requests that Mrs. Whiffler will tell Saunders what Tom said about mad bulls; and Mrs. Whiffler relating the anecdote, a discussion ensues upon the different character of Tom's wit and Dick's wit, from which it appears that Dick's humour is of a lively turn, while Tom's style is the dry and caustic. This discussion being enlivened by various illustrations, lasts a long time, and is only stopped by Mrs. Whiffler instructing the footman to ring the nursery bell, as the children were promised that they should come down and taste the pudding. The friend turns pale when this order is given, and paler still when it is followed up by a great pattering on the staircase (not unlike the sound of rain upon a skylight), a violent bursting open of the dining-room door, and the tumultuous appearance of six small children, closely succeeded by a strong nursery-maid with a twin in each arm. As the whole eight are screaming, shouting, or kicking—some influenced by a ravenous appetite, some by a horror of the stranger, and some by a conflict of the two feelings—a pretty long space elapses before all their heads can be ranged round the table and any thing like order restored; in bringing about which happy state of things both the nurse and footman are severely scratched. At length Mrs. Whiffler is heard to say, 'Mr. Saunders, shall I give you some pudding?' A breathless silence ensues, and sixteen small eyes are fixed upon the guest in expectation of his reply. A wild shout of joy proclaims that he has said, 'No, thank you.' Spoons are waved in the air, legs appear above the tablecloth in uncontrollable ecstacy, and eighty short fingers dabble in damson syrup. While the pudding is being disposed of, Mr. and Mrs. Whiffler look on with beaming countenances; and Mr. Whiffler, nudging his friend Saunders, begs him to take notice of Tom's eyes, or Dick's chin, or Ned's nose, or Mary Anne's hair, or Emily's figure, or little Bob's calves, or Fanny's mouth, or Cary's head, as the case may be. Whatever the attention of Mr. Saunders is called to, Mr. Saunders admires of course; though he is rather confused about the sex of the youngest branches, and looks at the wrong children, turning to a girl when Mr. Whiffler directs his attention to a boy, and falling into raptures with a boy when he ought to be enchanted with a girl. Then the dessert comes, and there is a vast deal of scrambling after fruit, and sudden spitting forth of juice out of tight oranges into infant eyes, and much screeching and wailing in consequence. At length it becomes time for Mrs. Whiffler to retire, and all the children are by force of arms compelled to kiss and love Mr. Saunders before going up stairs, except Tom, who, lying on his back in the hall, proclaims that Mr. Saunders 'is a naughty beast'; and Dick, who having drunk his father's wine when he was looking another way, is found to be intoxicated, and is carried out very limp and helpless. Mr. Whiffler and his friend are left alone together, but Mr. Whiffler's thoughts are still with his family, if his family are not with him. 'Saunders,' says he, after a short silence, 'if you please, we'll drink Mrs. Whiffler and the children.' Mr. Saunders feels this to be a reproach against himself for not proposing the same sentiment, and drinks it in some confusion. 'Ah!' Mr. Whiffler sighs, 'these children, Saunders, make one quite an old

man.' Mr. Saunders thinks that if they were his, they would make him a very old man; but he says nothing. 'And yet,' pursues Mr. Whiffler, 'what can equal domestic happiness! What can equal the engaging ways of children! Saunders, why don't you get married?' Now, this is an embarrassing question, because Mr. Saunders has been thinking that if he had at any time entertained matrimonial designs, the revelation of that day would surely have routed them for ever. 'I am glad, however,' says Mr. Whiffler, 'that you are a bachelor,—glad on one account, Saunders;—a selfish one I admit. Will you do Mrs. Whiffler and myself a favour?' Mr. Saunders is surprised—evidently surprised; but he replies, 'With the greatest pleasure.' 'Then, will you, Saunders,' says Mr. Whiffler, in an impressive manner, 'will you cement and consolidate our friendship by coming into the family (so to speak) as a god-father?' 'I shall be proud and delighted,' replies Mr. Saunders. 'Which of the children is it? really I thought they were all christened; or—' 'Saunders,' Mr. Whiffler interposes, 'they are all christened; you are right. The fact is, that Mrs. Whiffler is—in short, we expect another.' 'Not a ninth!' cries the friend, all aghast at the idea. 'Yes, Saunders, rejoins Mr. Whiffler, solemnly, 'a ninth. Did we drink Mrs. Whiffler's health? Let us drink it again, Saunders, and wish her well over it!' Doctor Johnson used to tell a story of a man who had but one idea, which was a wrong one. The couple who dote upon their children are in the same predicament: at home or abroad, at all times, and in all places, their thoughts are bound up in this one subject, and have no sphere beyond. They relate the clever things their offspring say or do, and weary every company with their prolixity and absurdity. Mr. Whiffler takes a friend by the button at a street corner on a windy day to tell him a *bon mot* of his youngest boy's; and Mrs. Whiffler calling to see a sick acquaintance, entertains her with a cheerful account of all her own past sufferings and present expectations. In such cases the sins of the fathers, indeed, descend upon the children; for people soon come to regard them as predestined little bores. The couple who dote upon their children cannot be said to be actuated by a general love for these engaging little people (which would be a great excuse), for they are apt to underrate and entertain a jealousy of any children but their own. If they examined their own hearts, they would, perhaps, find at the bottom of all this, more self-love and egotism than they think of. Self-love and egotism are bad qualities, of which the unrestrained exhibition, though it may be sometimes amusing, never fails to be wearisome and unpleasant. Couples who dote upon their children, therefore, are best avoided."

*A Treatise on Insects Injurious to Gardeners, Foresters, and Farmers.* By Vincent Kollar, Curator of the Royal Cabinet of Natural History at Vienna, and Member of many learned Societies. Translated from the German, and illustrated by Engravings, by J. and M. London; with Notes by J. O. Westwood, Esq., F.L.S. &c., Secretary to the Entomological Society. Pp. 377. London, 1840. Smith.

AMONG all the numerous works which have been written on entomology, we do not remember ever before to have seen a treatise solely on the insects injurious to vegetation, though it is precisely respecting these insects that the generality of persons feel most inter-

est. Every one who possesses a garden would willingly know some particulars of the caterpillars that devour his cabbages, and of the worms that lurk in the buds of his roses, though he may care little about entomology generally; and such persons will like the work before us all the better from its containing very few technical details.

In the year 1837, the farmers, foresters, and gardeners of Austria having suffered severely for the two or three previous seasons, from the ravages of insects which had destroyed their crops, the Royal and Imperial Agricultural Society of Vienna found it necessary to take some steps to try to prevent a recurrence of the evil. The first thing which appeared necessary was to make the sufferers acquainted with the nature and habits of their enemies; as in many cases these were suffered to escape, from the ignorance of their pursuers, when in states in which they might have been easily destroyed. The Society accordingly proposed to publish a treatise on the subject; and on this being represented to the late Emperor, Francis I., he not only sanctioned the undertaking, but commanded the principal scientific men attached to the Austrian government to assist in producing the work required. This, then, was the origin of the present treatise on insects, the materials furnished by the different Austrian naturalists having been, by the emperor's command, arranged for publication by M. Kollar, curator of the Royal and Imperial Cabinet of Natural History at Vienna. To fit it for the English public, it has been translated from the German by the Misses London, sisters to the well-known author of that name; and revised and illustrated with notes by J. O. Westwood, Esq., secretary to the London Entomological Society.

Thus originated, and thus introduced to the British public, Kollar's *Treatise on Insects* cannot fail to become a standard work; and we have no doubt that it will also become a popular one, as it is written in a clear and simple style, perfectly easy of comprehension, even to those before totally unacquainted with the subject. The importance of such a work will also be evident when we consider that "the greater number of insects change their form several times during their life in so striking a manner, that a person unacquainted with entomology would be inclined to consider one and the same insect, at different periods of its existence, as so many entirely different animals." Thus, a knowledge of the transformation of insects is of the greatest importance to every farmer, gardener, and forester; as, without it, he may behold his enemies without being aware of their presence, and may neglect the most suitable opportunity of destroying them.

It is evidently of great importance to all persons connected with rural affairs, to know where to look for the eggs of insects, as in this state they may be easily destroyed, and the ravages of the forthcoming brood prevented. On this account, M. Kollar tells us, that as the female moth dies soon after she has laid her eggs, whenever a moth is found with its wings folded, and in a state apparently of stupor, search should be made near it for eggs, which will be found in different situations, according to the nature of the insect.

"The white-thorn butterfly and the golden-tailed moth lay their eggs on the leaves of trees, and the latter covers them over with a golden-coloured covering of silk. The common lackey-moth fastens her eggs, in the form of a ring, round the branches of fruit-trees; and

the gipsy-moth lays hers in a broad patch on the trunk of a tree, or on paling, and covers them with a thick coating of hair. The winter-moth lays her eggs, singly, on the buds of the leaves and flowers; and the printer beetle introduces hers between the bark and the alburnum of the trunk."

M. Kollar then proceeds to observe, that when the eggs of insects are hatched, they produce what are called larvæ; those of butterflies, which are always provided with feet, are the caterpillars; and those of beetles, &c., which have no feet, are the grubs, or maggots. It is in the larva state that insects are usually destructive, as in the pupa state they lie in a state of deathlike stupor; and in the perfect state they very seldom take any food, and, when they do, it is only a little honey from the flowers.

We were much pleased with M. Kollar's observations on the "means contrived by nature to check the devastations of insects." Continued rains and spring-frosts, though so hurtful in many respects, are often of the most essential service in destroying our insect adversaries; and birds and bats devour myriads, which, but for their agency, would destroy many crops.

As a specimen of the exact manner in which the different insects are described, we may quote the following, which the Entomological Society of London have fixed on as the subject of their prize essay for 1840:—

"The Winter, or Dart Moth. *Agrotis (Noctua) segetum*. Autor.—This caterpillar attacks both the leaves and roots of the corn; by eating them off destroys the crop, and causes whole fields to require to be reploughed up. From many observations, the corn suffers most in rich soils in warm situations, and particularly in those fields which were early sown. This insect does not confine its ravages to corn alone, but attacks the roots of lettuce, turnips, and spinach; and on this account deserves no less the attention of the kitchen-gardener than that of the farmer. Before we detail the means of destroying so injurious an insect, we shall describe its appearance and habits, as a knowledge of these will best contribute to render the proposed means effectual. The moth appears generally in the month of August, in gardens and fields, sitting quietly on the ground in the daytime, and flying about and pairing at night. When at rest, its wings are folded together flat over the body; it is then nearly an inch long, and half an inch wide. Its colours are dirty grey, and dark-brown, or earth-colour, except on the under-wings, which are covered as it sits, and which are sometimes whitish grey, and sometimes cream-colour. . . .

"Ten or fourteen days after the eggs are laid in the earth, the young caterpillars are hatched, and consequently they appear about the end of August, or beginning of September. They eat at first the roots of various kinds of grasses for want of corn; attacking the tender roots of the corn in September and October, when it begins to spring. At the approach of the cold weather, they descend two or three inches deep into the earth, and prepare themselves an oval cavity, in which they pass the winter without doing any injury. In the beginning of spring they leave their winter's quarters, and feed again for a time on the roots of the corn and grass, without materially injuring the stronger plants. At the end of May or beginning of June, they prepare to enter the pupa state, which change is accomplished in a small hollow in the earth. After four weeks, the above-described moth bursts

from a brown pupa. The caterpillar measures, when fully grown, an inch and a half in length, and is of the thickness of a strong quill, cylindrical, somewhat thinner towards the posterior end; it has six pectoral and ten ventral feet, the body is smooth, shining, and free from hair. Its colours are chiefly brown and dark grey, which alternate in broad stripes along the body, but which are at the same time intermingled in some degree."

With regard to the destruction of these insects, M. Köllar observes, "That it is beyond all doubt, that the quickest and surest way of obtaining the end in view would be to kill the moth at its birth. But this is a very difficult affair: for, not to mention that the moth does not fly by day, it has so dull and insignificant an appearance, that it is very difficult to be distinguished from the dark, ploughed land where it sits. Various agriculturists have proposed to light fires at night on the corn-fields, and to catch and destroy the moths as they fly into them. But it is very difficult, indeed, quite impossible, to determine the exact day when the perfect insects are developed from the pupæ, as climate, temperature, and weather, together with various other causes, may either hasten or retard their development. We should therefore be obliged for many nights—indeed, for many weeks in succession—to make attractive fires, and to lie in wait for the moths as they appeared by degrees. In addition to the time and expense that this plan would require, the end would not be obtained, for another reason,—it is usually the male insect that flies about, while the more unwieldy female sits quietly, and is sought out by the male at the time of pairing. Then the number of males is always considerably greater than that of the females; so that, how many soever might be caught of the former, there would still be enough left of both to continue the species. As little can be effected against the pupæ as against the perfect insect, because the pupa is not exposed to view, as in some butterflies, but lies in the earth, and that at a time when fields are not usually turned up. Thus, as nothing useful can be effected against the perfect insect or its pupæ, it only remains for us to devise means whereby either the eggs or the young caterpillars may be destroyed before they have caused any considerable damage. It has been observed, that the corn in those fields which were early sown, and in those that have a strong warm soil, usually suffers most from the insect. We will, therefore, endeavour to ascertain the reason of this circumstance. Guided by an unerring instinct, insects always search out for their progeny those places where their eggs will be most secure from danger, and the young brood, at the moment of their birth, furnished with the most suitable food. This moth, which is usually developed in the month of August, endeavours to lay its eggs on loose ground, and hence prefers those fields which were early ploughed. Here she lays her eggs in the soil, which, having been dried and loosened by the warmth of the sun, she can penetrate into without much exertion. After two, or at most three weeks, the young caterpillars creep out of the eggs, and find, if the fields have been sown early, their favourite nourishment in the tender roots and leaves of the young corn. If the sowing had been delayed for a few weeks, the greater part of the young caterpillars must have perished for want of food. Should, therefore, the moth appear in great numbers in autumn, sowing the fields later would certainly be one of the most approved means of destroying the brood. But

why should strong warm soils be most infested with them? By the expression, strong warm soils, is here understood those that are manured with horsedung. It is well known that horsedung is the warmest of all kinds of manure. We know that many insects lay their eggs in places and on bodies which are in a certain stage of putrefaction, because such bodies are then in a state of fermentation, which is always accompanied with a considerable development of heat, by which the hatching of the larvæ or maggots will be accelerated. This hint is the more important to the agriculturist, as the observations that have been made actually shew, that in the devastations made by this insect, those fields suffered most that were manured with horsedung."

In conclusion, we have only to observe that the work is exceedingly well got up, and that the engravings are very good; and we heartily recommend this treatise to the attention of every one who possesses a garden, or other ground, as we are confident that no one taking an interest in rural affairs can read it without reaping both pleasure and profit from its perusal.

*The Court and Camp of Runjeet Sing.* By the Hon. W. G. Osborne, Military Secretary to the Earl of Auckland, Governor-General of India. 8vo. pp. 236. London, 1840. Colburn.

WITH a slight introductory sketch of the origin and rise of the Sikh state, and sixteen pretty engravings of its most "noticeable" men and circumstances in court and country, this volume gives an interesting account of the late ruler of the Punjab and of the condition and prospects of a division of India, which has become of prominent importance to our relations in that vast empire. The sovereign, or maharajah, at Lahore, with his sirdars, or chiefs, scattered over the face of the land, each glorying in his independence and inhabiting a place of strength, bear a striking resemblance to the olden feudality of Europe, and especially as it existed in the mountainous territory of Scotland four hundred years ago. Instead of being sterile, however, the region between the Indus and Sutlej is wonderfully fertile and prolific; and, instead of suffering from severity of cold, is exposed to the perhaps greater severity of heat.

For many years Runjeet Sing had found it his policy to remain steady in his alliance with our Indian government, and in return for a mission from him on the preceding year, Mr. Macnaghten, Dr. Drummond, Captain Macgregor, and the writer of this journal, were despatched by the governor-general, in 1838, to strengthen our connexion with him, and pave the way for the invasion of Cabul and the restoration of Shah Sooja to the throne. They accordingly departed from Simla and soon crossed the borders of Lahore, where a present of welcome, 1200 rupees (about 130*l.*), was presented to them, and they began to pass through the thickly studded keeps of the warlike sirdars. They found Runjeet at Adenanuggur, and were received with Oriental pomp by a magnificent set of fellows in splendid armour, troops of superb panoply, and a court blazing with ruby, pearl, and diamonds. One foul stain attaching, which we need not specify, we copy a few illustrative portions of Mr. Osborne's introductory picture:—

"Runjeet Sing possesses great personal courage, a quality in which the Sikhs are supposed to be generally deficient; and until the last few years, always led his troops into action himself. His character was formerly

that of a generous and liberal master; and it was his custom to go into action with his arms covered with golden bracelets, and to reward with a pair of them any act of personal courage on the part of his soldiers which might happen to meet his observation. But the vice of old age, avarice, is fast creeping upon him; and at this moment, two out of three of his regular infantry regiments at Peshowar are in a state of open mutiny for want of their pay, one of them being eighteen, and the other twenty-two months in arrears. With six millions sterling in his treasury at Amritsir, such is his love of money, that he will risk the loss of his kingdom rather than open his hoards, and disgorge his people and army by this ill-timed and cruel parsimony; at a time, too, when his most bitter enemies, Dost Mahomed Khan and the Afghans, are only watching for the first favourable opportunity to attempt his destruction. In the course of the afternoon, the maharajah's head man came by his master's orders to know if we should like to see his dancing girls; adding that four of them, who had lately arrived from Cachemire, were very handsome. Accordingly, after dinner, we repaired to a terrace on the banks of the canal, where we found eight young ladies assembled, and a display of fire-works prepared for our amusement on the opposite bank. The four Cachemirian girls were very pretty; and one of them, Sabhoo by name, would have been thought beautiful any where. They were richly and gracefully dressed in scarlet and gold embroidered shawl dresses, with large and enormously loose petticoats of handsomely worked silk. Their head ornaments were singular and very becoming; their glossy black hair hanging down the back in a number of long plaits, with gold coins and small bunches of pearls suspended to the ends, enormous strings of pearl for earrings, and large gold rings, with several pearls and emeralds attached to them, passed through their noses. They are very fair, with expressive countenances, and large and lovely eyes, but their beauty is much disfigured by the custom which prevails amongst all the Mogul women of covering the lower eyelid with gold leaf, which gives them a ghastly appearance. One of these girls, called the Lotus, is rather a celebrated character at the court of Lahore."

Upon this quotation we may note, 1st. The similarity of custom between this modern state and the most ancient nations, Jews, Greeks, Romans, &c., in rewarding military exploits by the presentation of bracelets. 2d. That the six millions at Amritsir are afterwards stated at twelve millions. 3d. That the Cachemire girls were members of a singular troop of armed Amazons, about 150 in number; and that the lovely Lotus was one of the four wives and five concubines of the Lion of Lahore, who soon after burnt themselves upon his funeral pile.\* If the Lahore customs in one instance resembled

\* "Every thing (we are informed) was done to prevent it, but in vain. They were guaranteed in their rank and in all their possessions, but they insisted upon it; and the account from the European officers who were present, describes it as the most horrible sight. The four wives seated themselves on the pile with Runjeet Sing's head upon their laps; and his principal wife desired Kuruck Sing, Runjeet's son and heir, and Dheean Sing, the late prime minister, to come to her upon the pile, and made the former take the maharajah's dead hand in his own, and swear to protect and favour Dheean Sing as Runjeet Sing had done; and she made the latter swear to bear the same true allegiance to the person which he had faithfully borne to his father. She then set fire to the pile with her own hands, and they are dead—nine living beings having perished together without a shriek or a groan. Dheean Sing threw himself twice on the pile, and said he could not survive his master, but was dragged away by main force. You have no idea what a sensation the poor old man's death has caused."

ancient usages, if, rather they snatched of savage Africa, all the following trait of hospitality will shew :—

"Returning home from a constitutional canter before breakfast, I was overtaken by one of Runjeet's Goorcherras, with a message from his master, begging me to meet him at his artillery practice-ground, where he was then waiting for me. On reaching the spot, I found him sitting in a sort of gilded litter with glass doors and windows, accompanied by a few Sikh horsemen, and young Heera Sing, who was in the litter with him. He immediately commenced his usual string of questions:—'Did you see my Cachemirian girls?' 'How did you like them?' 'Are they handsomer than the women of Hindostan?' 'Are they as handsome as English women?' 'Which of them did you admire most?' I replied, that I admired them all very much, and named the two I thought the handsomest. He said, 'Yes, they are pretty, but I have got some more who are handsomer, and I will send them this evening, and you had better keep the one you like best.' I of course expressed my gratitude for such unbounded liberality; and his answer was, 'I have got plenty more.'"

Mr. Osborne, prudently perhaps, tells us nothing of the result; but runs into a story about a famous horse :—

"I took (he says) the opportunity of asking him about the celebrated horse Leili, to attain which he had embroiled himself in a tedious and expensive war with a neighbouring province. He told me that the horse was the most perfect animal he had ever seen, but that he was now very old and almost worn out, but that he would send for him in order that I might see him. Runjeet's passion for horses amounts almost to insanity, at least such was the case a few years ago, though, at present, age has tamed that as well as other less harmless passions. Avaricious as he is, he did not appear to regret the enormous sum he had squandered to obtain possession of this animal (upwards of thirty thousand pounds), and still less does he regret the vast loss of life to his people, or of character to himself, which this barefaced and unjustifiable robbery entailed upon him. So determined was he to obtain Leili, that he kept the son of the chief in whose possession the animal was supposed to be, a boy of twelve years of age, a close prisoner in his court. In vain he was assured that the horse was dead; his answer was, 'You will remain a prisoner till he is found.' He kept his word; and not until the horse was delivered to him was the boy permitted to depart."

By like tyrannical means he obtained possession of the celebrated diamond, called "The Mountain of Light" (Koh-i-noor), of which Mr. O. relates :—

"It is valued at three millions sterling, is very brilliant, and without a flaw of any kind. Runjeet was anxious to know what it would be valued at in England, and whether we had ever seen so fine a one, &c. His string of pearls was, I think, if possible, even handsomer than the diamond; they are about 300 in number, and literally the size of small marbles, all picked pearls and round, and perfect both in shape and colour."

Two hours before he died he sent for all his jewels, and gave the famous diamond, called 'The Mountain of Light,' said to be the largest in the world, to a Hindoo temple, his celebrated string of pearls to another, and his favourite fine horses, with all their jewelled trappings, worth 300,000*l.*, to a third." Will they be so disposed of?

A religious or superstitious feeling seems to have been inherent in the Maharajah :—

"Runjeet Sing rarely undertakes any expedition of importance without consulting this holy book. When unable to make up his mind upon the probable success of any measure he has in contemplation, he takes a very simple method of solving his doubts, by placing between the leaves of the Grunth two slips of paper, on one of which is written the object of his wishes, and on the other the reverse. The papers are selected by one of his gooroo, or priests, without being looked at, and should the one first presented to him prove propitious to the expedition he may contemplate, he undertakes it with the greatest confidence of success; if otherwise, all idea of prosecuting it is immediately given up."

We hear a good deal of the Faqueer who pretended that he could be buried for weeks or months, and whose wonderful performances have been related in sundry Eastern journals; but as, in the end, he turned out to be an impostor, we shall not waste our time and paper upon his pretences and contrivances; but proceed with the embassy from Adeenanuggur to Lahore, the capital, on their way to which our countrymen suffered excessively from the intolerable heat. Here they witnessed reviews, military practicing; partook of courtly ceremonies; rode and hunted; and happily concluded the treaty, the object of their mission. A few selections will exhibit some of the more remarkable matters. First of a savage sect :—

"During my evening's ride I unfortunately got amongst a band of Akalees, and had to endure the usual quantity of abuse and blackguardism they make a point of so lavishly distributing to every one they meet. They are, without any exception, the most insolent and worthless race of people in all India. They are religious fanatics, and acknowledge no ruler and no laws but their own; think nothing of robbery, or even murder, should they happen to be in the humour for it. They move about constantly, armed to the teeth, and it is not an uncommon thing to see them riding about with a drawn sword in each hand, two more in their belt, a matchlock at their back, and three or four pair of quoits fastened round their turbans. The quoit is an arm peculiar to this race of people; it is a steel ring, varying from six to nine inches in diameter, and about an inch in breadth, very thin, and the edges ground very sharp; they are said to throw it with such accuracy and force, as to be able to lop off a limb at sixty or eighty yards' distance; but I have several times invited them to shew their dexterity, without witnessing any proof of it that could convince me of the truth of this supposed accuracy. In general, the bystanders have been in greater danger than the object aimed at. Runjeet Sing has done much towards reducing these people to a state of subjection (though they are still very troublesome), by breaking up the large bands of them that were accustomed to congregate in all parts of the Punjab. He has raised some irregular regiments composed entirely of Akalees, which he always employs on any dangerous or desperate service; and as they fight like devils, he continues to make them useful, as well as to expend a great number of them in this way. In 1815, when the maharajah's army was investing the city of Moulton, the Afghans made so protracted and determined a defence, that Runjeet Sing was induced to offer very advantageous terms, compared to what he was in the habit of doing

under similar circumstances; and during the progress of the negotiations, an Akalee, named Sadhoo Sing, with a few companions, advanced to the fausse braye, and without orders, in one of their fits of enthusiasm, attacked the Afghans, who were sleeping or careless on their watch, and killed every man; the Sikh army took advantage of the opportunity, and rushing on, in two hours carried the citadel; Muzuffer Khan and his four sons being all cut down in the gateway, after a gallant defence. Though Runjeet Sing has considerably moderated the nuisance, he has by no means exterminated it, and has signally failed in emancipating himself from their insults and abuse; for at any review where any of these regiments may be paraded, it is still a common occurrence for them, on marching past him, to throw handfuls of musket-balls at his feet, and abuse and insult him in every sort of manner, frequently threatening his life—a threat which in more than one instance they have attempted to fulfil. The maharajah bears it all with the greatest coolness, and they proceed with perfect impunity until they are detected in any great crime, such as robbery or murder, when he shews no mercy, and they are immediately deprived of either their noses, ears, arms, or legs, according to the degree of their offence. During our sojourn at Adeenanuggur, an individual, supposed to be a servant of Rajah Golaub Sing's, was detected by one of the sentries concealed in a mango-tree, overlooking Runjeet's zenana. After a couple of shots the Sipahis brought him down, and he was kept in close confinement till the hour the durbar assembles, when he was sent for by the maharajah, and in five minutes dismissed without either ears or nose, and died in a few hours."

Sent a Shuta surwar (camel-riding) off with an express to Simla, to say that our business was coming to a conclusion. Was awakened this morning, at three o'clock, by the return of the Shuta surwar we had despatched the evening before; he came back covered with blood, and stripped to the skin, with the account of his having been attacked about seven miles from Lahore by a band of Akalees. They had cut off one of his fingers, taken his camel, carbine, and pistols, all his clothes and his despatches, and then told him he might return as fast as he pleased. Sent him off to the maharajah to make his complaint to him: he returned in the course of the afternoon, having received one hundred rupees for his camel, another hundred for his arms and clothes, and fifty for his finger, and upon the whole seeming very well satisfied. Runjeet has sent some of his cavalry after the Akalees, and if he catches any of them they will lose one, if not both of their arms, or perhaps a leg instead. His executions are very prompt and simple, and follow quickly on the sentence: one blow of an axe, and then some boiling oil to immerse the stump in, and stop all effusion of blood, is all the machinery he requires for his courts of justice. He is himself accuser, judge, and jury; and five minutes is about the duration of the longest trial at Lahore."

The following are also particulars worthy of notice :—

"The rains having set in, have brought out all the musquitoes and reptiles that swarm in the gardens; and what with the buzzing and stinging of the former, and the dread of finding one of the latter in one's bed, it is by no means a pleasant residence. Captain Stuart of the escort killed two large cobra capellas this morning in his room, and two of the Sipahis were found dead, having been bitten by a snake

whilst asleep. They brought the snake to me alive, it having been caught by one of the poor fellow's comrades: it was a small dark green one, about eighteen inches in length, and not so thick as my little finger. They both appeared to have died instantaneously, and without even awaking. The only wound was a small puncture on the sole of the foot. \* \*

"On my return home, I met the maharajah taking his usual ride. He was very inquisitive as to where I had been, and I never saw him in so good a humour or such high spirits. After a good deal of gossip upon various subjects, he said, 'You have never been at one of my drinking parties; it is bad work drinking, now the weather is so hot; but as soon as we have a good rainy day, we will have one.' I sincerely trust it will not rain at all during our stay, for, from all accounts, nothing can be such a nuisance as one of these parties. His wine is extracted from raisins, with a quantity of pearls ground to powder, and mixed with it, for no other reason (that I can hear) than to add to the expense of it. It is made for himself alone; and though he sometimes gives a few bottles to some of his favourite chiefs, it is very difficult to be procured, even at the enormous price of one gold mohur for a small bottle. It is as strong as aquafortis, and as, at his parties, he always helps you himself, it is no easy matter to avoid excess. He generally, on these occasions, has two or three Hebes in the shape of the prettiest of his Cachemirian girls to attend upon himself and guests, and gives way to every species of licentious debauchery. He fell violently in love with one of these fair cup-bearers about two years ago, and actually married her, after parading her on a pillion before himself on horseback, through the camp and city, for two or three days, to the great disgust of all his people. The only food allowed you at these drinking bouts are fat quails stuffed with all sorts of spices, and the only thing to allay your thirst, naturally consequent upon eating such heating food, is this abominable liquid fire. Runjeet himself laughs at our wines, and says that he drinks for excitement, and that the sooner that object is attained the better. Of all the wines we brought with us as a present to him from the governor-general, consisting of port, claret, hock, champagne, &c., the whisky was the only thing he liked. During these potations he generally orders the attendance of all his dancing girls, whom he forces to drink his wine, and when he thinks them sufficiently excited, uses all his powers to set them by the ears, the result of which is a general action, in the course of which they tear one another almost to pieces. They pull one another's nose and earrings by main force, and sometimes even more serious accidents occur; Runjeet sitting by encouraging them with the greatest delight, and exclaiming to his guests, 'Burra tomacha, burra tomacha' (great fun)."

Our countryman did escape the drinking bout, which reminds us of those of the great conquerors of Asia, sung by their bards, from Alexander the Great to Timour the Tartar, and their successors to the latest period. But we have finished our task, and have only to add that, on the death of Runjeet Sing, his son, Kurruck Sing, mounted the throne without opposition, though it was expected that his natural son, Sher Sing, might have contested the point. Kurruck is represented as not being a very able prince; and Sher Sing's son, Pertab (a child seven years old), as being a prodigy of precocity and promise. The future is therefore hid from our view; but it appears

evident, that whoever rules the Punjab must either adhere truly to the English, or the country be added to our conquests in Hindostan.

*The Ingoldsby Legends; or, Mirth and Marvels.* By Thomas Ingoldsby, Esq. 8vo. pp. 339. London, 1840. Bentley.

WHAT need we say of this clever and humorous volume?—original in matter, unique in treatment, and most harmonious in versification. The greater part of the pieces have given spirit to "Bentley's Miscellany;" and some three or four appeared a good while ago in Blackwood's famed Magazine. They are now collected together for the delectation of every reader who loves drollery, fancy, playful satire, and genuine sporting between the ludicrous and intellectual; and the case in which they are so worthily enshrined is appropriately embellished. We will not repeat any thing recent from our brother periodicals, but choose for our specimen a poem which we think must be sixteen years old in Old Ebony's repertory, and consequently (with the Public's short memory) about as good as new:—

"The Ghost.

There stands a City, neither large nor small,  
Its air and situation sweet and pretty;  
It matters very little—if at all—  
Whether its denizens are dull or witty,  
Whether the ladies there are short or tall,  
Brunettes or blondes,—only, there stands a city;  
Perhaps 'tis also requisite to minute  
That there's a Castle and a Cobbler in it.  
A fair Cathedral, too, the story goes,  
And kings and heroes lie entomb'd within her;  
There pious saints, in marble poem repose,  
Whose shrines are worn by knees of many a sinner;  
There, too, full many an aldermanic nose  
Roll'd its loud diapason after dinner;  
And there stood high the holy sconce of Becket,  
Till four assassins came from France to crack it.  
The Castle was a huge and antique mound,  
Proof against all th' artillery of the quiver,  
Ere those abominable guns were found  
To send cold lead through gallant warrior's liver.  
It stands upon a gently rising ground,  
Sloping down gradually to the river,  
Resembling (to compare great things with smaller),  
A well-scooped, mouldy Stilton cheese, but taller.  
The Keep, I hear, 's been sadly alter'd lately,  
And, 'stead of mail-clad knights, of honour jealous,  
In martial panoply, so grand and stately,  
Its walls are fill'd with money-making fellows,  
And stuff'd, unless I'm misinformed greatly,  
With leaden pipes, and coke, and coals, and bellows;  
In short, so great a change has come to pass,  
'Tis now a manufactory of Gas.  
But to my tale. Before this profanation,  
And ere its ancient glories were cut short all,  
A poor, hard-working cobbler took his station  
In a small house, just opposite the portal:  
His birth, his parentage, and education,  
I know but little of—a strange, odd mortal;  
His aspect, air, and gait were all ridiculous;  
His name was Mason—he'd been christen'd Nicholas.  
Nick had a wife possessed of many a charm,  
And of the Lady Huntingdon persuasion;  
But, spite of all her piety, her arm  
She'd sometimes exercise when in a passion;  
And, being of a temper somewhat warm,  
Would now and then seize, upon small occasion,  
A stick, or stool, or any thing that round did lie,  
And baste her lord and master most confoundedly.  
No matter!—'tis a thing that's not uncommon.  
'Tis what we have all heard, and most have read of,—  
I mean a bruising, pugilistic woman,  
Such as I own entertain a dread of;  
And so did Nick, whom sometimes there would come on  
A sort of fear his spouse might knock his head off,  
Demolish half his teeth, or drive a rib in.  
She shone so much in facers and in fibbing.  
'There's time and place for all things,' said a sage  
(King Solomon I think), and thus I can say,  
Within a well-roped ring, or on a stage,  
Boxing may be a very pretty fancy.  
When Messrs. Burke or Bendigo engage;  
—'Tis not so well in Susan, Jane, or Nancy:  
To get well mill'd by any one's an evil,  
But by a lady—'tis the very Devil.  
And so thought Nicholas, whose only trouble  
(At least his worst) was this his rib's propensity,  
For sometimes from the ale-house he would hobble,  
His senses lost in a sublime immensity  
Of cogitation—then he couldn't cobbler—  
And then his wife would often try the density

Of his poor skull, and strike with all her might,  
As fast as kitchen wench strikes a light.

Mason, meek soul, who ever hated strife,  
Of this same striking had the utmost dread,  
He hated it like poison—or his wife—  
A vast antipathy!—but so he said—  
And very often, for a quiet life,  
On these occasions he'd sneak up to bed,  
Groping darkling in, and, soon as at the door  
He heard his lady—he'd pretend to snore.

One night, then, ever partial to society,  
Nick, with a friend (another jovial fellow),  
Went to a club—I should have said society—  
At the City Arms, once called the Porto-Bello;  
A spouting party, which, though some decry it, I  
Consider no bad lounge when one is mellow;  
There they discuss the tax on salt, and leather,  
And change of ministers, and change of weather.

In short, it was a kind of British forum.  
Like John Gale Jones's, ever in discordantly,  
Only they managed things with more decorum,  
And the orations were not quite so silly;  
Far different questions, too, would come before 'em,  
Not always politics, which, will ye nill ye,  
Their London prototypes were always willing,  
To give one *quantum suff. of*—for a shilling.

Here they would oft forget their rulers' faults  
And waste in ancient lore the midnight taper,  
Inquire if Orpheus first produced the waltz,  
How gas-lights differ from the delphic vapour,  
Whether Hippocrates gave Glauber's salt;  
And what the Romans wrote on ere they d' paper;  
This night the subject of their disquisitions  
Was ghosts, hobgoblins, sprites, and apparitions.

One learned gentleman, 'a sage, grave man,'  
Talked of the ghost in 'Hamlet,' 'sheathed in steel';  
His well-read friend, who next to speak began,  
Said, 'That was poetry, and nothing real';  
A third, of more extensive learning, ran  
To Sir George Villier's ghost, and Mrs. Veal;  
Of sheeted spectres spoke, with shortened breath,  
And thrice he quoted 'Dreincourt on Death.'

Nick smoked, and smoked, and trembled as he heard  
The point discuss'd, and all they said upon it,  
How frequently some murder'd man appear'd,  
To tell his wife and children who had done it;  
Or how a miser's ghost, with grizzly beard,  
And pale lean visage, in an old Scotch bonnet,  
Wander'd about to watch his buried money!  
When all at once Nick heard the clock strike one,—he

Sprang from his seat, not doubting but a lecture  
Impended from his fond and faithful She;  
Nor could he well to pardon him expect her,  
For he had promised to come home to tea;  
But having luckily the key of the back door,  
He fondly hoped that, unperceived, he  
Might creep up stairs again, pretend to doze,  
And hoax his spouse with music from his nose.

Vain, fruitless hope! The weary sentinel  
At eve may overlook the crouching foe,  
Till, ere his hand can sound the alarm-bell,  
He sinks beneath the unexpected blow;  
Before the whickers of Grimaikin fell,  
When slumbering on her post, the mouse may go;  
But woman—wakeful woman! 's never weary,  
Above all, when she waits to thump her dearly.

Soon Mrs. Mason heard the well-known tread,  
She heard the key slow creaking in the door,  
Spied, through the gloom obscure, towards the bed,  
Nick creeping soft, as oft he had crept before;  
When bang she threw a something at his head,  
And Nick at once lay prostrate on the floor;  
While she exclaimed, with her indignant face on—  
'How dare you use your wife so, Mr. Mason?'

Spare we to tell how fiercely she debated,—  
Especially the length of her oration;  
Spare we to tell how Nick expostulated,  
Roused by the bump into a good set passion,  
So great, that more than once he execrated,  
Ere he crawled into bed in his usual fashion:  
The Muses hate brawls; suffice it then to say,  
He ducked below the clothes, and there he lay.

'T was now the very witching time of night, [dead;  
When churchyards groan, and graves give up their  
And many a mischievous enfranchised sprite  
Had long since burst his bonds of stone or lead,  
And hurried off, with schoolboy-like delight,  
To play his pranks near some poor wretch's bed,  
Sleeping perhaps serenely as a porpoise,  
Nor dreaming of this fiendish *hucius corpus*.

Not so our Nicholas, his meditations  
Still to the same tremendous theme recur'd;  
The same dread subject of the dark narrations,  
Which, backed with such authority, he'd heard:  
Lost in his own horrific contemplations,  
He pondered o'er each well-remembered word,  
When at the bed's foot, close beside the post,  
He verily believed he saw—a ghost!

Plain and more plain the unsubstantial sprite  
To his astonished gaze each moment grew;  
Ghastly and gaunt, it reared its shadowy height,  
Of more than mortal seeming to the view,  
And round its long, thin, bony fingers drew  
A tattered winding-sheet, of course all white;

The moon that moment peeping through a cloud,  
Nick very plainly saw it through the shroud !

And now those matted locks, which never yet  
Had yielded to the comb's unkind divorce,  
Their long-contracted amity forget,  
And spring asunder with elastic force;  
Nay, e'en the very cap, of texture coarse,  
Whose ruby cincture crowned that brow of jet,  
Uprose in agony—the Gorgon's head  
Was but a type of Nick's up-squatting in the bed.

From every pore distill'd a clammy dew,  
Quaked every limb—the candle too, no doubt,  
*En rigle* would have burnt extremely blue,  
But Nick unluckily had put it out ;  
And he, though naturally bold and stout,  
In short, was in a most tremendous stew ;—  
The room was filled with a sulphureous smell,  
But where that came from Mason could not tell.

All motionless the Spectre stood, and now  
Its rev'rend form more clearly shone confest ;  
From the pale cheek a beard of purest snow  
Descended o'er its venerable breast ;  
The thin grey hairs, that crown'd its furrow'd brow,  
Told of years long gone by.—An awful guest  
It stood, and with an action of command,  
Beckon'd the Cobbler with its wan right hand.

' Whence, and what art thou, Exorable Shape ?'  
Nick might have cried, could he have found a tongue,  
But his distended jaws could only gape,  
And not a sound upon the welkin rung ;  
His gooseberry orbs seem'd as they would have sprung  
Forth from their sockets,—like a frighten'd Ape  
He sat upon his haunches, bolt upright,  
And shook, and grinn'd, and chatter'd with affright.

And still the shadowy finger, long and lean,  
Now beckon'd Nick, now pointed to the door ;  
And many an awful glance and frown between,  
The angry visage of the Phantom wore,  
As if quite vex'd that Nick would do no more  
Than stare, without e'en asking, ' What d'ye mean ?'  
Because, as we are told,—a sad old joke too,—  
Ghosts, like the ladies, never speak till spoke to.

Cowards, 'tis said, in certain situations,  
Derive a sort of courage from despair,  
And then perform, from downright desperation,  
Much more than many a bolder man would dare.  
Nick saw the Ghost was getting in a passion,  
And therefore, groping till he found the chair,  
Seized on his awl, crept softly out of bed,  
And follow'd quaking where the Spectre led.

And down the winding-stair, with noiseless tread,  
The tenant of the tomb pass'd slowly on,  
Each may turning of the humble shew  
Seem'd to his step at once familiar grown,  
So safe and sure the labyrinth did tread  
As though the domicile had been his own,  
Though Nick himself, in passing through the shop,  
Had almost broke his nose against the mop.

Despite its wooden bolt, with jarring sound,  
The door upon its hinges open flew ;  
And forth the Spirit issued, yet around  
It turn'd as if its follower's fears it knew,  
And, once more beckoning, pointed to the mound,  
The antique keep, on which the bright moon threw  
With such effulgence her mild silvery gleam,  
The visionary form seem'd melting in her beam.

Beneath a pond'rous archway's sombre shade,  
Where once the huge portcullis swung sublime,  
Mid ivied battlements in ruin laid,  
Sole, sad memorials of the olden time,  
The Phantom held its way,—and though afraid  
Even of the owls that sung their vesper chime,  
Pale Nicholas pursued, its steps attending,  
And wondering what on earth it all would end in.

Within the mouldering fabric's deep recess  
At length they reach a court obscure and lone ;  
It seem'd a drear and desolate wilderness,  
The blacken'd walls with ivy all o'ergrown ;  
The night-bird shriek'd her note of wild distress,  
Disturb'd upon her solitary throne,  
As though indignant mortal step should dare,  
So led, at such an hour, to venture there !

The Apparition paused, and would have spoke,  
Pointing to what Nick thought an iron ring,  
But then a neighbouring chandelier awoke,  
And loudly 'gan his early matins sing ;  
And then 't started like a guilty thing,  
As his shrill clarion the silence broke.  
'Tis known how much dead gentlefolks eschew  
The appalling sound of ' Cock-a-doodle-do !'

The vision was no more— and Nick alone—  
' His streamers waving ' in the midnight wind,  
Which through the ruins ceased not to groan ;  
His garment, too, was somewhat short behind,  
And, worst of all, he knew not where to find  
The ring, which made him moist his fate bemoan.  
The iron ring,—no doubt of some trap-door,  
' Neath which the old dead miser kept his store.

' What's to be done ?' he cried, 'T were vain to stay  
Here in the dark without a single clue.  
Oh for a candle now, or moonlight ray !  
' Fore George, I'm vastly puzzled what to do,'  
(Then clapp'd his hand behind)— ' 'Tis chilly too—  
I'll mark the spot, and come again by day.

What can I mark it by ?— Oh, here's the wall—  
The mortar's yielding— Here I'll stick my awl !'

Then rose from earth to sky a withering shriek,  
A loud, a long-protracted note of woe,  
Such as when tempests roar, and timbers creak,  
And o'er the side the masts in thunder go ;  
While on the deck resistless billows break,  
And drag their victims to the gulpha below ;  
Such was the scream when, for the want of candle,  
Nick Mason drove his awl in up to the handle.

Scared by his lady's heart-apalling cry,  
Vanish'd at once poor Mason's golden dream—  
For dream it was ; and all his visions high,  
Of wealth and grandeur, fled before that scream—  
And still he listens with averted eye,  
When gibing neighbours make ' the ghost ' their  
theme ;  
While ever from that hour they all declare  
That Mrs. Mason used a cushion in her chair !'

" The Bagman's Dog," a funny new story,  
concludes the volume, which, with its very  
clever and appropriate engraved title-page, we  
cordially recommend to all who love genuine wit  
and racy and original humour.

*Reliquiæ Antiquæ. Scraps from Ancient Manuscripts, Illustrating chiefly Early English Literature, and the English Language.*  
Edited by Thomas Wright, Esq. M.A.  
F.S.A., &c. and James Orchard Halliwell,  
Esq. F.R.S. F.S.A. &c. No. II. and III.  
8vo. London, 1840. Pickering.

WE think that this curious publication becomes more interesting every number, and we are sure that it will confer a great benefit on the study of English literature and English language. The second and third numbers contain no fewer than forty-five articles of the most varied description, written chiefly in English, but some of them in Latin and Anglo-Norman, during the eleventh, twelfth, thirteenth, fourteenth, and fifteenth centuries. Among the pieces of a more serious character we have sermons, legends, hymns, moral fragments, &c. &c. Among those of a lighter character are popular songs, burlesques, macaronics, satirical pieces, &c. One of the most curious articles is a selection of early medical receipts, some of which are very amusing ; as the following, for example :—

" For hym that haves the squynansy : tak a fatte katte, and fla hit wele, and clene, and draw oute the guttes, and tak the grees of an urcheon, and the fatte of a bare, and resynes, and feinygreke, and sauge, and gumme of wodebynde, and virgyn wax ; al this raye smal, and farse the catte within als thu farses a gos, rost hit hale, and geder the grees and enoynt hym tharwith."

The next is " a receipt to catch fishes :"—

" Tak palma Christi and frankandsence, and medul hem togedir, and put hit in a fomme clowte, and hold the poudre on thi finger that a gold ryng is upon, and wasch thi hond in every corner of the pout, fishes wolle come to thi honde."

In the third number are some very curious early English sermons (twelfth century) ; and in the second is given, which is still more curious, a laughable burlesque upon the style of preaching used by the Catholic priests at the beginning of the fifteenth century. Of the latter, the following may serve as a specimen :—

" Syrs, what tyme that God and Seynt Petur come to Rome, Petur askud Adam a full greyt dowtfull question, and seyd, ' Adam, Adam, why ete thu the appull unpard ? ' ' For sothe,' quod he, ' for y had no wardyngs fryde.' And Petur saw the fyr, and dred hym, and steppud into a plomtre that hanged full of rype redde cherys," &c.

Among other things in No. III. is a most singular list of appellations of the hare. We may also point out a very curious early poem

on popular English proverbs, most of which proverbs we recognise as being in use at the present day. We will extract a few of them, and in so doing, take leave of this book for the present, with the hope that it will meet with the encouragement it deserves :—

" God biginning maketh god endyng."  
" Wyt and wysdom is god wayson."  
" Ase fele thede, ase fele thewes."  
(*As many people, so many manners.*)  
" Luef child lore byhoveth."  
" Betere his eye sor, then al bynd."  
" Sely chylid is sone y-lered."  
" Wel fytht (*lights*), that wel fyth."  
" Sottes bolt is sone shote."  
" Tel thou never thy fo that thy fot aketh."  
" Betere is appel y-geve then y-ete."  
" Tonge breketh bon,  
Ant nad hire saive non."  
" Under boske shal men wedder abide."  
" When the bale is heat (*higest*),  
Thenne is the bote nest (*nearest*)."  
" Brent child fur dredeth."  
" Fer from eye, fer from herte."  
" Of un-boht hude men kerveth brod thong."  
" Lytht chep hethere yeldes."  
" Dere is boht the hony that is lickid of the thorne."  
" Of alle mester men mest me hongeth theves."  
" Ever out cometh eld spone web."  
" Moni mon for londe wyveth to shonde."

#### MISCELLANEOUS.

*Prince Albert, with a particular Memoir of the Reigning Family of Saxe Coburg Gotha.* By Frederic Shoberl, Esq. Pp. 242. Colburn. WE owe Mr. Shoberl a good turn, and we rejoice in this early opportunity of paying him ; and justly stating that this volume is one of great and immediate interest, containing all the information which could be desired by the country respecting the ancestry and family of that amiable personage who has been called to so prominent a station near the throne of England. There is a portrait of Prince Albert, whose fine open countenance appears to be a perfect index to the noble and intellectual qualities to which every one who has approached him bears witness in terms of admiration and esteem. It is a volume which deserves to be most popular, and will, no doubt, soon be in the hands of all our reading and inquisitive population.

*Prince Albert, his Country and Kindred.*

Pp. 96. T. Ward.

Is another work of the same kind and adorned with woodcuts. It is very respectably executed.

*The Hand-book of Chemistry ; with a Complete Index of Reference.* By G. H. Caunter. 8vo. pp. 279. London, 1840. Orr and Co.

" SCIENCE," Sir John Herschel observes, " should be stripped of everything that tends to clothe it in a strange and repulsive garb, and especially every thing that, to keep up an appearance of superiority in its professors over the rest of mankind, assumes an unnecessary guise of profundity and obscurity, should be sacrificed without mercy." In this spirit, and to this end, has the *Hand-book* been compiled. All but the indispensable technical terms have been avoided, and these explained when they occur. The elements of chemistry are thus presented to the reader in a concise and simple form, most inviting and conducive to the study of the science, to an acquaintance with the known laws of chemical action, and to a knowledge of the composition and properties of matter according to those laws. We need not enlarge upon the benefits, the acquisitions to the luxuries and necessities of man, which have been derived from chemistry, as an inducement to the study of this important science. And it is almost superfluous to impress upon our readers, that to the being who thinks beyond his own imme-

diates wants and worldly advancement, chemistry affords never-ending sources of exercise for the intellectual faculties with which the Creator has endowed him. Not to rest contented with things as they appear to the physical senses, is the broad distinction between the mere animal and the intelligent creature. To investigate the relations and causes of the wonders of Nature is the proud privilege of man. The *Hand-book* will assist and encourage the inquirer. The preface and introduction are well and forcibly written.

*Discourses on Special Occasions.* By the late Rev. R. S. M'All, I.L.D. With a Sketch of his Life and Character, by the Rev. R. Wardlaw, D.D. 2 vols. 8vo. pp. circ. 1150. Jackson and Walford.

Dr. M'ALL was an eminent divine, of great integrity and piety, whose long and distinguished services in that dissenting body which differs in few essentials from the Church of England seem to have entitled his memory to this tribute from his fellow-labourers in a gospel ministry for the edification of their flocks. His life, by Dr. Wardlaw, is written in a vein of religious solemnity; and his funeral sermon by the late Mr. Roby, of Manchester (brother, we believe, to the gentleman whose name has of late been so much abused in political controversy), is both instructive and eloquent. The rest of these thick volumes consists of Dr. M'All's discourses on many important occasions.

#### ARTS AND SCIENCES.

##### SOCIETY OF ARTS.

ON Tuesday evening, Mr. Maugham was to have given an illustration 'On the Manufacture of Glass.' That gentleman, however, being at Brussels, superintending the lighting of that place with gas, Dr. Truman supplied the blank by giving an admirable lecture 'On the Human Voice.' The doctor, in a plain and highly interesting manner, described the anatomy of the parts, and shewed that in man, as in certain other animals, the breaking or shifting of tone was prevented by a simple apparatus, precisely similar to that in the mouth-piece of a clarionet. When this apparatus is defective the voice runs into the falsetto. This was eminently the case with John Kemble, who strove hard all his life to overcome the defect, but never succeeded. On a *post-mortem* examination it was found that it would have for ever been impossible for him to avoid, in what may be termed his hypertragical tones, that shrillness of sound which characterised him. What musicians call compass, is attributable to the extent to which different persons are enabled to elongate or shorten the windpipe by muscular action. Tone depends on the length of the column of air in the larynx, and in the length of its vibratory chords. Large drawings of the organs of voice in birds, and of several mammalia, were exhibited; the convolutions of the windpipe in some of the former were exceedingly curious: they produce the same effect as the winding of a French horn.

##### ZOOLOGICAL SOCIETY.

VISCOUNT BRAYBROOKE in the chair.—Fellows were elected. Balance, including yearly subscriptions, carried to account, February 1st, 1127l. 17s. Upwards of 3000 persons visited the gardens and museum in January. Sir John M'Neill recently presented to the Society a dog, of the species used by the wandering tribes in Persia to guard their flocks. It is a shaggy animal, nearly as large as a

Newfoundland, and very fierce and powerful. The dam of the animal presented killed a full-grown wolf without assistance.

##### PARIS LETTER.

Academy of Sciences, Feb. 11, 1840.

SITTING of February 4.—The principal memoir read at this sitting was one by M. Dumas, on his 'Theory of Chemical Substitution,' on which such an animated controversy has been carried on between this eminent chemist and the followers of the school of M. Berzelius. We may sum up the theory of the French philosopher, as based on his experiments, thus:—"All chemical substitutions take place by means of equivalents: but two cases occur; either the substances are substituted for each other, or else they are displaced by each other. In the former, the product retains its initial type and molecular form; in the latter, it preserves no chemical analogy with the composite substance from which it proceeds, and it changes its molecular form." Hence M. Dumas infers, that some reactions by substitution between chemical substances are more common, more easy, and less liable to alteration, than those by displacement; it is possible to determine beforehand the properties of the composite substances that may be produced. Then, while the theory of equivalents can only enumerate those combinations which are possible between given substances, the theory of substitutions can foresee the combinations that are necessary: and this M. Dumas considers to be a result of inappreciable importance to the progress of chemical knowledge. A change in chemical nomenclature is said by M. Dumas to be a necessary consequence of this theory; and he declared in his memoir, that the actual system, founded in great part on the discoveries of Lavoisier, was inadequate to the actual state of chemical knowledge.—A letter was read from M. de Humboldt, stating that M. Galle, of the Berlin Observatory, had discovered, on 25th January, at a quarter to eleven, a new comet, then in the constellation of the Dragon. The elements of its orbit had not been ascertained. It was mentioned, that the comet of the 2d December had been observed fifteen times at Marseilles, and that its elements differed very little from those calculated at Berlin by M. Peterson. It had been observed at Paris five times, and its elements calculated separately by two observers according to Olbers's system; the two calculations accorded very closely with the positions observed.—A communication was made from M. Valz, of Marseilles, on an extraordinary fall of rain there on the 27th of September, 1839, which, in twenty minutes, had given 44 millimetres, or nearly 17 inches of water. One of the streets, which is from 90 to 100 feet in breadth, and which is on a declivity towards the harbour, was transformed into a torrent of more than 18 inches deep. It was, however, a remarkable circumstance, that the year 1839 was, on the whole, among the driest known for a long period in that part of France.—A note was read upon a curious instance of Will-o'-the-Wisp fires seen at Fontainebleau on the 22d December. The day had been overcast, damp, and close; and, from five till nine in the evening, some pools of stagnant, muddy water in the town emitted small blue flames, with a slight crackling noise, from their surface. It was observed, that the more the water was agitated the more flames were emitted.—A communication was noticed from M. Diefenbach of Berlin on a 'Method of Curing Cases of Converging Strabismus, or Squinting,' by cut-

ting the internal muscle of the eyeball affected.—M. Flourens read a note 'On the Colouring of the Bones of Animals by infusing Madder Root into their Food.' He mentioned, that the first discovery of this fact was made by Antoine Mizaud, or, at least, mentioned by him, in a collection of "Secrets of Internal History," published in 1572; but that it was not noticed till it was taken up by Mr. Belcher of London, in 1736; and subsequently, by M. Duhamel. M. Flourens exhibited a great number of skeletons of pigeons, on which he had been experimenting with different kinds of madder; and stated, that within twenty-four hours after the madder had been taken the bones were thoroughly tinged. The madder did not in the least affect the cartilaginous parts of the body.

M. Villermé has just published a curious statistical and medical work on "Physical and Moral Condition of Workmen in Large Towns, and on the Readiest and Best Methods of Ameliorating their Condition."—Among other late curiosities given to the French reading public is a volume of poems, by a self-taught poet, named Magn, a weaver at Lizy-sur-Ourcy. From what we have seen of the book, we do not think much of it; notwithstanding that, it is not devoid of merit: he rarely soars above the trivial, and often borders on the vulgar.—The fourth volume of M. Benjamin Delessert's "Icones Selectæ Plantarum," containing the composite, has been published. It contains 100 beautiful copperplates, coloured with great accuracy.—Several works on the Abolition of Slavery have recently appeared: since, however, they go over the same ground which is so well known to British philanthropists, it is not worth while to analyse them.

The first number of the "Revue d'Architecture et des Travaux Publics" appeared on the 15th ult. It is beautifully got up, and is a good specimen of French typographical art.—The papers by M. Albert Lenoir 'On Byzantine Churches,' and by M. Polonceau 'On Chain Bridges,' are of high interest. The engravings are beautifully executed, and are of much value to architects and practical engineers. This journal gives a regular account of all new English inventions. The editor and founder, Mr. C. Daly, is, by descent, of British origin. M. Cohen, the translator of the Old Testament from the original Hebrew into French, has just published the first number of the "Archives Israélites de France," a monthly periodical. It is intended to contain accounts of the former and actual state of the Jews in France; of the current Hebraical literature, &c. This number has a curious article 'On Jewish Literature since 1789;' another 'On the Rabbins of Metz;' another 'On the best Hebrew MSS. in France.'

M. Girault de Prangey's large work "On the Arabic and Moorish Monuments of Spain" is now terminated;—the remains at Seville, Grenada, and Cordova, are exceedingly well done. Under the title of "Nouvelles d'un Autre Monde; or, Les Indiscrétions d'un Echappé de Clichy," we have an amusing narrative given of what goes on in the debtor's prison, &c., and a collection of anecdotes, more or less true, but all of them worth reading.

##### DISCOVERY OF NEW SOUTH SHETLAND.

IT has often struck me convincingly that New South Shetland, one of the more recent "discoveries" towards the South Pole, attributed to Smith, is no other than the land which was seen and described by Theodore Gerrard, a Dutchman, more than two hundred years ago; or, that if it does not belong to the

same continuous coast, it is part of the same archipelago, or cluster of islands. It would appear that Smith, having made the land far to the eastward, and somewhat northerly, ran down the coast precisely in the direction of Gerrard's landfall, and to within three or four hundred miles of it; that is, supposing Gerrard to have been correct in his reckoning. The latter was carried by a storm, in 1899, so far as 64° south latitude, where he met with a *mountainous land, covered with snow*.

Another, and a striking proof of the identity here referred to, is afforded in the remarkable coincidence in the descriptions by which these navigators have characterised the physiognomy of the coast; their comparisons being precisely similar. Gerrard, who, having doubled Cape Horn, and passed the straits of Magellan, was driven in a storm, under bare poles, for nearly two days, may, perhaps, have overrated his run; and, considering the imperfection of nautical astronomy at that time, it is possible that both he and Smith may have beheld not merely the same continent, or group of islands, but even the same point, mountain, and promontory, of this South Thale.

Captain Weddell has laid down land as far as 70° west; but how much further it extends is yet unknown. He observes that "many navigators had, in their passage round Cape Horn, reached 67° south, but always too far west to fall in with the range of New South Shetland, until the year 1818, when Mr. William Smith of Blythe made, apparently by accident, a discovery of the islands thus named." He further remarks that Captain Freneau narrowly escaped seeing New South Shetland, having passed within forty-five miles of the eastern end; and hence we may presume that twenty miles of a more southerly course would have given, or rather confirmed in us, a knowledge of the same fifty years earlier. Some very learned discussions were maintained in 1820 respecting the course taken by Cook and other navigators in the southern Pacific Ocean; and reasons were deduced why this important discovery had never previously been made. Not the slightest notice was taken of Gerrard! Nor have I seen his labours referred to in any modern work, except Dr. Brewster's "Encyclopædia," and that only partially. The ignorant and interested followers of American Vespuccius would willingly have assigned to oblivion the name of Columbus; but examples of this sort cannot meet with imitators in these more enlightened days. — *T. Hancock.*

#### THE ROYAL IRISH ACADEMY.

THE proceedings of this Institution (which we may attribute to the impulse given by the meeting of the British Association at Dublin) apply to many inquiries of great scientific and literary interest; and we have much pleasure in referring to the fasciculi of November and December, giving an account of the leading subjects.

At the meeting of the former month we see by a statement, read by Mr. Morrison, that an Institute of Architects had been formed in Ireland, with the prospect of being eminently useful in advancing that important art.

As Colonel Reid has attracted such universal attention to the theory of storms, we copy the following:—

"The Rev. Dr. Dickinson gave a verbal account of a remarkable waterspout, which he had observed at Killiney. Towards the end of the month of July, about 10 A.M., while standing on the shore of the bay of Killiney, his

attention was directed by a friend to a waterspout, distant about a quarter of a mile from the land. It was not similar in form to the representations of waterspouts usually given, and may therefore deserve to be noticed. It was shaped like a double syphon, the whole being suspended at a considerable elevation in the air; the longer end of the syphon reached towards the sea, and appeared to approach it nearer and nearer, till, at length, its waters were distinctly seen rushing into the deep. The loop gradually lowered, as if sinking and lengthening by its own weight, while the upper part of the syphon seemed not to lose in elevation. At length the loop burst, and there were three streams of water pouring into the sea, two of those streams still continuing united by the arch at the top. The breadth of these streams gradually diminished till they became invisible, but their length seemed undiminished as long as they were at all seen. The quantity of water poured down must have been very considerable, as the bubbling of the sea beneath could be distinctly observed."

Mr. Clarke read a paper 'On Atmospheric Electricity,' in which, after describing the apparatus employed in his experiments, &c., he "proceeded to give an account of the extended series of experiments which he had undertaken at the recommendation of the Academy, and which he had continued during twelve months, at intervals of fifteen minutes, during at least ten days, and from three to seven nights in each month. He stated, that when he had undertaken this series of experiments, he had the following objects in view:—namely, to determine the mean amount of electric intensity existing in this country, at the different hours of day and night, and the periods of maxima and minima; and, secondly, to endeavour to trace the cause of this varying intensity to the influence of some of the recognised agents in nature—such as the variations of atmospheric pressure; the variations of temperature; or the varying quantity of vapour in our atmosphere. He was happy to announce, that he had not only determined the mean monthly and annual force of electricity at the several hours of the day and night, but also had succeeded in establishing its dependence upon two out of the three agents, with which he had originally proposed to investigate its connexion. The two with which he has established its connexion and proved its dependence are, temperature, and the total quantity of moisture present in the air, as shown by the dew point. Indeed these two phenomena, as the author remarked, are referable to each other, the temperature producing evaporation, and the force of electricity at any period being shewn to be almost exactly proportional to the tension of the vapour so produced. The hour of the first electric minimum was shewn to be about 3 A.M., the electricity increasing with the temperature until 10 A.M., when a slight decrease occurred; the electric tension again commences rising at about 11 A.M.; and continues to increase until about 2<sup>h</sup> 45<sup>m</sup> P.M.—all these movements being in exact proportion to the elevation of the dew point and temperature. At 3 P.M. the dew point and temperature begin gradually to lower, as does also the electricity (but not so quickly); but from 5 to 7 P.M. the electric intensity rises, being acted upon and increased by the precipitation of the evening dew, which has set free the latent electricity of the condensed vapour, in conformity with the experiment of Volta. Again, from 7 P.M. the electric intensity weakens rapidly, and descends in common with the dew point and tempera-

ture until they all reach their minimum about 3 A.M. Thus the patient investigation of this subject has laid bare the cause of the varying diurnal intensity of the electric fluid,—shewing it to be the result of evaporation, which, besides its agency in carrying the electric fluid from our earth to the upper regions of the air, daily returns it to us by the conducting power of this vapour, in the direct proportion of its quantity."

This paper was continued at the December meeting, when Mr. Clarke "described an experiment by which he had shewn the absence of decomposing agency in the electricity of serene weather, and stated his opinion of the cause. Mr. Clarke next directed attention to the fact, that the curve representing the diurnal variation of the barometric column was the reverse of the electric, thermometric, and hygrometric curves. He considered that such a result was to be expected; for the barometric column should naturally be lower from mid-day to 3 P.M. than at midnight, in consequence of the greater quantity of aqueous vapour which exists in the atmosphere at the former than at the latter time,—air charged with aqueous vapour being known to be of less specific gravity than dry air. Thus the barometric and hygrometric curves would be the inverse of each other, the maxima of the one corresponding to the minima of the other; and, as the author had previously shewn that the hygrometric, thermometric, and electrometric curves were in accordance, the barometric curve would be the inverse of the thermometric and electrometric curves also. The author remarked, that if this character of the horary oscillations of the barometer in Ireland be confirmed by the experiments of other observers, it will either lead to new views of this phenomenon generally, or shew that the quantity of aqueous vapour existing in Ireland is so great as to cause the horary barometric oscillations to present themselves in a different form from that in which they are recognised in drier climates. The author adverted, in the last place, to the hypothesis of Priestley and Becaria,—that the upper regions of our atmosphere were the chief depositories of the electric fluid,—an opinion which he conceived must fall, if the origin of atmospheric electricity be due (as his experiments prove) to the existence of vapour; as these elevated parts of our atmosphere are far above the region of permanent vapour, or even of vapour at all."

Professor Mac Cullagh read a paper of profound calculations 'On the Dynamical Theory of Crystalline Reflection and Refraction,' the forms of which forbid our copying it.

[To be concluded next week.]

#### LITERARY AND LEARNED. UNIVERSITY INTELLIGENCE.

OXFORD, Feb. 6.—The following degrees were conferred:—

Bachelor in Civil Law.—Rev. E. J. Pogson, Fellow of St. John's College.

Masters of Arts.—M. Pattison, Fellow of Lincoln College; T. J. Brown, Fellow of New College; Rev. R. Stanley, Brasenose College; Rev. R. W. Smith, Scholar of Jesus College; F. H. Deane, Wadham College.

Bachelors of Arts.—W. Holland, Lincoln College, Grand Compounder; J. Fraser, Scholar of Lincoln College; A. Baynam, Pembroke College; R. S. Hunt, Exeter College; R. H. Gray, V. Page, C. Smith, S. H. Cooke, G. Marshall, Students, C. W. A. Napier, Christ Church; H. Branker, J. C. Browne, Wadham College; W. Beckett, Trinity College.

CAMBRIDGE, Feb. 1.—Smith's Prices.—The result of the re-examination of Messrs. Goodwin and Woolley for the second prize, as announced to take place last week, has confirmed the place of the former gentleman; the prizemen are, 1st, Dr. Ellis; 2d, Dr. Goodwin.

## ROYAL SOCIETY.

THE Marquess of Northampton in the chair.—The most noble Marquess intimated that his *soirées* would commence on Saturday the 29th instant. The continuation of a paper entitled 'Experimental Researches in Electricity, Sixteenth Series,' by Mr. Faraday, was read. We defer our report of the numerous experiments detailed in this valuable communication, and their results, till next *Literary Gazette*. They shewed the conducting powers of various bodies, namely, nitrous acid, a good conductor; nitric acid, the reverse when pure; sulphuric acid, potassa, gold, silver, zinc, nickel, iron and gold, iron and palladium, sulphate of bismuth, sulphate of lead, and so forth.

## ROYAL SOCIETY OF LITERATURE.

JANUARY 23d. — Colonel Leake, V. P. in the chair. The following papers were read:—1st, 'On the Island of Cos,' by Colonel Leake. This memoir was accompanied with numerous inscriptions, copied by Lieutenant Helpman, and by a map of the island reduced from one by Lieutenant Graves and Lieutenant Helpman. According to a tradition generally received in Greece, this renowned island was occupied by a Pelagic colony from Thessaly, Cnida, and Halicarnassus, fourteen centuries before the Christian era. Descendants of the Thessalians of Cos were engaged in the war against Troy; not long after which, the island received a portion of that Doric colony from the Peloponnese which caused this part of Asia Minor to bear afterwards the name of Doris. Its government was originally monarchical; but this form it appears to have rejected, even before it fell under the republican influence of Athens. Respecting the topography of Cos, much information, and probably of the most authentic kind, is to be obtained from the 7th Idyl, ascribed to Theocritus, but supposed by Reiske to be the production of Simichidas, a native poet. Oromedon was the name of its highest mountain, and Barinna that of a celebrated fountain, said to have been discovered by Chalcion, one of the monarchs named in its early history. Its principal city was occupied in the twentieth year of the Peloponnesian war by Astyochus, the Lacedemonian admiral, and in the following year it was fortified by Alcibiades. When Rhodes became powerful, Cos was generally in alliance with that island; in particular, at the time the Rhodians sided with the Romans against Antiochus. Strabo, who gives an account of Cos two hundred and fifty years after the time of Theocritus, enumerates among its most illustrious men, Simus, a physician; Philetas, a poet and critic; Ariston, disciple and heir of Ariston the peripatetic; an eminent musician, named Theomnestus; and Hippocrates, the physician. The last, by far the most celebrated of the men of Cos, was a member of an ancient family, descended from Æsculapius; and is said to have derived his practice in part from the descriptions of the cures consecrated in the Asclepieium, or temple of Æsculapius, situated in the suburbs of Cos: this temple was renowned for its rich monuments, among which, says Strabo, was formerly the Venus Anadyomene. Hippocrates, however, retired from Cos in the latter part of his life, and died at Larissa in Thessaly. Cos, like the neighbouring communities of Doric origin, employed the Doric dialect, at least in its public documents (as is proved by one of the inscriptions in the collection which accompanied this memoir), long after the time which some learned men have supposed to have been the termination of the dis-

tinction of dialects, viz. the conquest of Asia by Alexander. The memoir concluded with details of the ancient geography of Cos, illustrated from the inscriptions under the following heads:—City of Cos, Isthmus, Halisarna, Stromalimne, &c. The "Corpus Inscriptionum Græcarum" of Boeckh contains twenty-three inscriptions from Cos; but they are in only two instances the same as those in Lieutenant Helpman's collection.—2. 'On the Two Meanings of the Greek word *ῥίσιμα*,' by James Orchard Halliwell, Esq. The meaning of this word is commonly supposed to be expressed by the Latin *corollarium*: a distinct sense, however, from that which *corollarium* conveys belongs to it. It was shewn by Mr. Halliwell, by means of extracts from the commentaries of Proclus on Euclid, that there are two descriptions of porisms, viz. the class of propositions of Euclid so called, requiring investigation and demonstration; and the porisms, or corollaries, of Euclid's "Elements," which are of an intermediate character between problems and theorems. The etymology of the porism, or corollary of the "Elements," from *ῥίσιμα*, gain, may be right; and the other meaning of this term, as implying investigation, may be the ground of its application to the porisms of Euclid. In the first sense it is the common corollary, which is an acquisition (or gain) from another proposition. From the other signification of the word, *ῥίσιμα* also denotes any thing to be investigated. Thus, without any connexion between these two classes of propositions, they may, incidentally, from the two unconnected meanings of a Greek word, have obtained the same name.

## SOCIETY OF ANTIQUARIES.

FEB. 13. Mr. Amyot, Treasurer, in the chair.—Mr. Buckler communicated a letter 'On the West End of the Aisle of St. Mary Overie's Church, Southwark,' with a drawing.—A letter was read from Mr. Davis, describing 'The Discovery of several Urns of Half-burned Clay,' at Edinbridge, Kent.—The reading of Mr. Horsfall's 'Description of Orford Castle' was concluded.

LITERARY AND SCIENTIFIC MEETINGS  
FOR THE ENSUING WEEK.

Monday.—Statistical, 8 P.M.; British Architects, 8 P.M.; Medical, 8 P.M.  
Tuesday.—Linnean, 8 P.M.; Horticultural, 3 P.M.; Civil Engineers, 8 P.M.; Electrical, 8 P.M.  
Wednesday.—Society of Arts, 7½ P.M.  
Thursday.—Royal, 8½ P.M.; Antiquaries, 8 P.M.; Western Literary, 8½ P.M.  
Friday.—Geological (Anniversary), 1 P.M.; Royal Institution, 8½ P.M.; Botanical, 8 P.M.  
Saturday.—Westminster Medical, 8 P.M.; Physical, 8 P.M.

## FINE ARTS.

## ROYAL ACADEMY.

ON Monday, the 10th instant, a general assembly of the Academicians of the Royal Academy of Arts was held at their apartments in Trafalgar Square, when Daniel Maclise, William Frederick Witherington, and Solomon Alexander Hart, Esqrs., were duly elected royal academicians, in the room of Sir William Beechey, Charles Rossi, and William Wilkins, Esqrs. deceased.

## BRITISH INSTITUTION.

[Third Notice.]

18. *The Visit of Boccaccio to Petrarch at Arqua, bearing the Decree of the Florentine Senate, restoring his Patrimonial Property.* J. Partridge.—A welcome visit no doubt, and deriving much of its interest from the circumstances under which it was made. As a work of art, however, its best titles to dis-

tingtion are the fine pictorial qualities with which Mr. Partridge has invested it.

32. *The Connoisseur.* J. Linnell.—Evidently the portrait of a well-known collector. The great merits of the performance are its individuality and striking effect both in colouring and in chiaroscuro, amounting almost to a perfect deception on the sight. Few artists have combined so great a mastery over the landscape pencil, and over the portrait pencil, as Mr. Linnell.

17. *The Curtain Lecture.* W. Kidd.—There is nothing shrewish or vindictive in the principal character in this little drama of humble life. It appears to represent the just remonstrances of a diligent and injured wife against the idle and intemperate habits of a selfish and brutal husband. The protracted breakfast, and the boy preparing for school, accord well with the scene.

51. *A Neapolitan Fruit-Girl.* J. Inskipp.—Simple in its character, and harmonious in its colouring, we have seldom seen a more pleasing production from this able artist. It does honour to the British school of painting, and would not disparage that of Spain or Venice.

52. *The Gipsies' Toilet.* P. F. Poole.—"Vanity of vanities, saith the Preacher, vanity of vanities; all is vanity." Open or concealed, it is as manifest in the ragged tent of the gipsy, as in the decorated boudoir of the St. James's belle,—in the beads and feathers of the untutored savage, as in the refined costume of the cultivated beauty. Mr. Poole has illustrated his subject under a very picturesque form, and has given favourable specimens of the wandering tribe.

42. *The Duel.* 43. *The Invalid.* T. Clater.—These pictures, having been very judiciously brought into juxtaposition, afford ample matter for reflection in the contrast between the gay employment of youth and the pious resignation of advanced years. As a further recommendation, they are painted in a clear and highly finished style.

106. *The Timber Carriage.* 201. *The Straw Yard.* J. F. Herring.—We wish that these two very able works had had the advantage of near neighbourhood, like those which we have just mentioned. They would have afforded a beautiful illustration of labour and rest. As representations of animal character under the most picturesque appearances, they possess the highest qualities of art.

132. *A Gleaner.* C. Landseer, A.R.A.—A tasteful example of pastoral beauty, with an appropriate and sunny back-ground, cheering with the hope of an abundant harvest.

134. *The Free Companion.* J. M. Leigh.—A clever study of an armed soldier:—by the courtesy of ancient chroniclers called a Free Companion, but in the modern version a freebooter,—"more free than welcome."

151. *The Post-office, from the Antiquary.* T. Clater.—We have often been delighted with the passage in Sir Walter Scott's admirable work which forms the subject of this performance, and we think Mr. Clater has been very successful in depicting the excess of female curiosity.

150. *Christmas Eve*, by the same Artist, is a pleasing and gratifying view of domestic enjoyment in humble life.

153. *Wounded Guerilla, with his Comrades defending the Outer Wall of a Franciscan Convent: a Scene during the Peninsular War.* W. Simson.—The representations of scenes like these, although they develop the powers of the artist, can never be contemplated without

painful emotions. In his treatment of the subject, Mr. Simson has shewn great skill in the character and action of the gallant defenders, and has brought the aid of his decided and brilliant execution to give effect to the whole.

248. *Interior in Penshurst Castle, with part of Queen Elizabeth's Room.* A. Morton.—Though painting is essentially an imitative art, it is not always that its deceptive quality obtains a principal regard in the eye of the connoisseur. But when, as in the present instance, the scenic representation with its gorgeous materials is brought forward in so skillful and striking a manner, it is impossible not to admire the talents of the artist.

280. *Characters in Mrs. S. C. Hall's Drama of "The Grooves of Blarney," as represented by Tyrone Power, Esq. N. J. Crowley, R.H.A.*—We know of few living writers whose graphic descriptions are better calculated to excite the fancy of the painter or rouse the powers of the actor than those of Mrs. Hall. In her

delineations of Irish character especially, she is unrivalled. Seldom have we seen such delineations embodied and illustrated with so much humour and effect as in the present performance, which, both in its principal incidents and in its accessories, displays a rich vein of materials well suited to scenic representation as well as to exhibit the talents of an artist, whose name, indeed, we have met with before, but whose works have never been so fairly brought under our view.

362. *'Tis True to Life.* J. Absolon.—And readily, judging from that which is seen of the excellence of that which is concealed, do we enter into the old man's burst of admiration; for the accessories are painted as deceptively as in the interior we have just mentioned; and (which is of still more importance) the principal group loses nothing thereby of that substance and reality which ought to belong to representations of life.

[To be continued.]

#### COMPARATIVE RETURNS OF THE SCHOOLS OF DESIGN.

SOME time ago, viz. October in 1837, we gave Returns of the Schools of Design in Paris, Bavaria, Wurtemberg, and Prussia, we now subjoin further information of the same nature, of still more interest to Englishmen, in Returns of the Government School of Design at Somerset House, and that of the Society in Leicester Square.

That of Government at Somerset House.			That of the Society in Leicester Square.		
For Outfit.	£. s. d.	£. s. d.	For Outfit.	£. s. d.	£. s. d.

Or for each of fifty-one students 75 <i>l.</i> 13 <i>s.</i> 4 <i>d.</i> for one year and ten months, or about 40 <i>l.</i> per annum.		3858 12 3			

#### GRAPHIC SOCIETY.

THE third meeting of this Society took place on Wednesday. It was one of the most numerously attended of the season, perhaps of the Society since its formation. This was unfortunately felt by the visitors, for Mr. Willis, of the Thatched House, where the meeting takes place, had, without any sort of announcement to the Committee of the Society, or any member of it, disposed of the usual room of their meeting, and left them only a smaller, and, consequently, crowded room. We trust the Society, which has afforded so much gratification to its visitors, will not allow a recurrence of this inconvenience. There were numerous and beautiful works of art presented to the notice of the visitors. We were particularly

struck with an engraving by Brandard, from Turner's beautiful picture, "Crossing the Brook," which, for spirit and delicacy of execution, cannot be surpassed; an exquisite drawing, by Bartholomeo; some large drawings for a Byzantine Church, by a Russian artist; many rich folios, stored with miscellaneous drawings; and many filled with studies of great ability and interest. Among them were a fine collection by a son of Mr. Goodhall, the engraver, studies of extraordinary merit; and a folio of drawings made in Egypt, by Mr. Müller. Some of Mr. Talbot's photogenic drawings, superior to any we had before seen, were placed on the table; and many fine specimens of the new art of multiplying medals by Voltatype, were shewn,

both finished and in progress. The meeting, in spite of the *contra-temps* of the change of rooms, was a very gratifying one.

#### ORIGINAL POETRY.

##### BRIDAL BELLS.

RING the bells, ring the bells,  
Be as merry as ye may;  
Ring the bells, ring the bells,  
For Victoria's wedding-day!  
Oh! many a bonny flower  
In the land of sunshine blows,  
But the pride of sun and shower  
Is our bonny "English Rose!"  
She is young and she is fair,  
With a frank but regal air—  
Ring the bells, then, in tower and steeple.  
And ever may she be the Queen of a free,—  
Of a free and a loyal people!  
Ring the bells, ring the bells, &c.

She hath navies on the sea,  
She hath armies on the land;  
They have set the nations free  
From Oppression's iron hand.  
Not a fetter'd slave is seen  
Amid those who call her Queen—  
Ring the bells, then, in tower and steeple.  
And ever may she be the Queen of a free,—  
Of a free and a loyal people!  
Ring the bells, ring the bells, &c.

On mountain and on plain  
Once again shall smile the spring;  
And blithe shall be the strain,  
As the sons of Freedom sing:—  
"Freedom's eye is bright and blue,  
So is Queen Victoria's too—  
Ring the bells, then, in tower and steeple,  
And ever may she be the Queen of a free,—  
Of a free and a loyal people!"  
Ring the bells, ring the bells, &c.

In the palmy days of Rome,  
Rife with conquest, strife, and tear,  
Britain's isle was Freedom's home,  
Queenly warriors grasp'd the spear.  
With Victory's Roman name,  
More than Roman be her fame—  
Ring the bells, then, in tower and steeple,  
And ever may she be the Queen of a free,—  
Of a free and a loyal people!  
Ring the bells, ring the bells,  
Be as merry as ye may,  
Here's a bumper to "our Queen!  
And God bless her wedding-day!"  
Feb. 8, 1840. H. B.

#### BIOGRAPHY.

Stephen Price, Esq.—We have to record, with much regret, the sudden death of this gentleman, at New York, on the 20th of January. Quinsy is stated to have been the cause of this fatal event. Few individuals were more generally known than Mr. Price, either in America or England. In the former country he was for thirty years the enterprising proprietor of the Park Theatre, and, in the latter, he was, for a while, the lessee of Drury Lane, where he lost much money. He afterwards recovered himself, and occupied an important station in the theatrical world, and living much in the society of literary and intelligent men. But we fear that latterly the pressure upon stage concerns again affected his prosperity to a certain degree; and he left England to superintend his concerns at New York, where a strong opposition had been gotten up against him. Mr. Price possessed an astute mind, and much information on most of the subjects which interest the public. Of a sanguine temperament,

he was somewhat rough in manners; but within the external husk there was a kernel of heart and feeling, from which sprung many instances of kindness and generosity that did honour to his nature.

### THE DRAMA.

*Drury Lane.*—An Emblematic Tribute, in honour of her Majesty's nuptials, with showy dresses, loud and not very agreeable music, and two beautiful scenes, viz. a Panoramic View of London and Windsor Castle, mid-day and moonlight, and a Vauxhallish finale of fireworks, will, we fear, not live beyond the usual period of such temporary pieces.

*Covent Garden.*—*A Legend of Florence*,\* a play in five acts, by Mr. Leigh Hunt, has been successfully produced at this theatre. It belongs to the Romantic Drama, and is founded on an Italian story, in the treatment of which the author has adapted the incidents to his own views, and clothed them in language and sentiments not unfamiliar to the poetic school, which his former writings have illustrated. This has occasioned peculiarities in rhythm; in the use of words with meanings different from those commonly attached to them; and in various points of expression, construction, and elaborate simplicity. As in the case of the patient Griselda of the olden tale, a tyrannical husband domineers over a submissive and enduring wife, whose cause is espoused by a virtuous lover, to whom her despotic lord had been preferred by her parents whilst yet she was too young and docile to make an election for herself. Her apparent death, at the end of the third act, forms a crisis which would end the plot, but that she revives from her mortal trance to revisit the glimpses of the moon. Her terrified and superstitious husband imagines the spectral appearance in the habiliments of the grave, to be a disembodied spirit, and closes his door against the appeal; but the lady finds succour from her lover, and protection from his mother, till she enters a convent. Her husband, however, reclaims; and she is about to give another instance of conjugal obedience, when he utters one of his brutal taunts, and she is passive no longer. An affray ensues, and the oppressor is slain by one of the characters, an officer of the Pope's guards. The curtain drops, and we are left to presume that the heroine will be compensated for her past sufferings by being united to the man of her heart's choice.

The play was cast as follows: *Agolanti*, the husband, Mr. Moore; *Rondinelli*, the lover, Mr. Anderson; *Da Riva*, a poet, and friend of the latter, Mr. Bartley; *Colonna*, the captain above mentioned, and a kind of Mercutio, Mr. G. Vandenhoff; *Giulio*, a page, Mrs. Walter Lacy; *Ginevra*, the wife, Miss Ellen Tree; *Olimpia* and *Diana*, two of her friends, Miss Charles and Mrs. Brougham; and *Fiordilisa*, Miss Lee. The acting throughout was very good. Mr. Moore did infinitely better than we anticipated from his *début*, and shewed sense, discrimination, and ability, in a rather arduous part. His rival, Mr. Anderson, also deserved much praise for the skilful manner in which he contrasted his intense but controlled passion with the fiery and imperious vehemence of *Agolanti*. Miss Ellen Tree performed with exquisite feeling. The author's love of nature could not have been more naturally realised than by this fine impersonation. It is, indeed, the sheet-anchor of the piece; and its domestic and female beauties will be the chief attraction for the public, by winning the approbation of

the sex, which, however tyrannised over in particular instances, has great influence in filling the theatres. The other characters were sustained to the full extent of their opportunities; and Mrs. Walter Lacy, in the page, was especially graceful and touching.

With regard to the legend, as a dramatic composition, much may be said in its favour, and something in doubtfulness upon its peculiarities. As a general remark, it may be stated, that the interference of the lover in the family concerns of another, teaching him how he ought to behave to his wife, and threatening him with the consequences if he does not act as prescribed, is almost provoking enough to justify very indifferent usage. Let us confess, further, that the meekness of the lady is rather a trial of temper, especially as she never condescends to favour her turbulent spouse with one soft or kind look—at least he declares so; and though he is a bad fellow altogether, we do not hear falsehood attributed as one of his vices. He is well sketched in the following description by *Da Riva*:—

—“Thus it is.  
He highly approves her virtues, talents, beauty;  
Thinks her the sweetest woman in all Florence,  
Partly, because she is,—partly, because  
She is his own, and glorifies his choice;  
And therefore he does her the honour of making her  
The representative and epitome  
Of all he values,—public reputation,  
Private obedience, delighted fondness,  
Grateful return for his unamiableness,  
Love without bounds, in short, for his self-love:—  
And as she finds it difficult, poor soul,  
To pay such reasonable demands at sight,  
With the whole treasure of her heart and smiles,  
The gentleman takes pity on—himself!  
Looks on himself as the most unresponded to  
And unaccountably ill-used bad temper  
In Tuscany; rages at every word  
And look she gives another; and fills the house  
With miseries, which, because they ease himself  
And his vile spleen, he thinks her bound to suffer;  
And then finds malice in her very suffering!  
*Colonna.* And she, they tell me, suffers dangerously?  
*Da Riva.* 'Tis thought she'll die of it. And yet,  
observe now:—  
Such is poor human nature, at least such  
Is poor human inhuman nature, in this man.  
That if she were to die, I verily think  
He'd weep, and sit at the receipt of pity,  
And call upon the gods, and think he loved her!”

The charming penultimate line is sadly coupled with the last where the heathen gods have nothing to do, and are inconsistent with any trait of *Agolanti's* character. *Rondinelli's* intermeddling is not above suspicion; for we are told of the two ladies, *Olimpia* and *Diana*, visiting *Ginevra*,

“Partly, if they can,  
To bring him better news of his saint's health.”  
And *Fiordilisa*, speaking of a letter from him, which she has refused to open:—

“Oh, she says dreadful things. She says you and I  
Will kill her; that we make her, or would make her,  
Tell falsehoods to her husband, or bring down  
His justice on our heads; and she forbids me,  
However innocent you may call, or think it,  
Bring letters any more. She bade me give it you  
Back again—see—unopened.”

*Giulio.* ‘Tis a pity  
That, too.  
*Fiordilisa.* Why, Giulio?  
*Giulio.* Oh, Signor Antonio  
Read it me!—ay, he did—he's such a gentleman.  
He said,—‘See, Giulio, I would not have you wrong  
Your mistress in a thought; nor give you an office  
Might do yourself the thought of wrong or harm.’  
You know I told you what he wrote outside—  
You recollect it—there it is—‘Most harmless,—  
I dare to add, most virtuous!’ and there's more  
Besides here, underneath. Did she read that?  
*Fiordilisa.* I know not. She read very quickly, at  
any rate;  
Then held it off, as though it frightened her,  
And gave it back.”

And when the wife will not enter into this secret correspondence, he thus boldly addresses the husband:—

“If Signor Agolanti values his wife's peace, and life,  
he will meet the writer of this letter instantly; who will

wait for him, an hour from the receipt of it, in the wood near his gate, by the road-side leading to Cortona.”

ANTONIO RONDINELLI.”

Now, even fond and good husbands would dislike this sort of dictation. The portion of a scene in which *Ginevra's* forbearance is sorely tried had an admirable effect, and, with her ghostly appearance to *Rondinelli*, produced the greatest sensation of the performance; but we must defer further extracts.

We had intended to specify the odd expressions, strange use, or, as we think, misuse, of words and phrases, and other small affectations which belong to Mr. Hunt's school, and are plentifully sprinkled over these pages, but must confine ourselves to a very few.

“*Agolanti.* Sirs, with this sudden incursion of strange news—

And your as strange, I must say, though well-meant  
Fancy, of the necessity of refusing it.”

To “fell him, like a cuff o' the conscience,” p. 10; this “*faunter*,” p. 21; “*gusty griefs*,” p. 28; “falling in gulfs of weakness” (fainting), p. 37; “every pore turn to a noon of water,” p. 57; “I can walk *strangely*,” p. 63, are only samples of a multitude of similar quaintnesses; but to illustrate the employment of words with meanings not accepted in the English tongue would lead us too far, and we can only notice the circumstance. In conclusion, we have to say that the dresses and scenery altogether were splendid—the age of Boccaccio and Petrarch was living upon the stage.

On Wednesday, a grand *Masque*, in honour of her Majesty's nuptials, was produced. It is a splendid spectacle, and the expense in getting it up seems to have been lavish. The scenery is beautiful, particularly a short moving panorama, by the Grieves—of Gravesend, the river, the channel, advance of the Spanish Armada, its defeat and dispersion, the latter managed with great skill and fine effect. The river, also, from Gravesend to the Channel, is a perfect gem (we had nearly said of the first water) in scene-painting. The *tableaux* are well chosen and arranged: in that of King Charles's second landing at Dover, from West's picture, Mr. Diddear's resemblance to the portraits of the Merry Monarch is remarkable. Of the music we cannot speak so favourably; with the exception of one concerted piece and one solo sung by *Vestris*, it is of a very noisy character, and any thing but harmonious. Poor Miss Rainsforth, who plays *Disord*, should not be compelled to sing it too. The dresses are new and handsome; and as a magnificent show, the *Masque* will doubtless run its time.

*Olympic.*—This fashionable little theatre has re-opened under a new management. On the first night, and during the week, four short pieces have been played. Of these, *Mr. and Mrs. Grubb* has been acted elsewhere, and was, we think, scarcely worth translating. *The Pink of Politeness*, new and fairly acted by Mr. R. Jones, Mr. Baker, Mr. Turnour, Mrs. Anderson, &c. &c., and got up with handsome dresses, has been successful. *A Familiar Friend*, a comic sketch, cleverly written, and supported by Mrs. Glover in a part admirably suited to her, is received nightly with merited laughter and applause, and is alone worth the price of admission. The remaining characters are sustained by Mr. Brooks, Mr. Turnour, Mr. Pitt, Miss Fitzwalter (an old favourite on these boards), and others, who all seem to imbibe a portion of the buoyant spirit of the heroine. The entertainments conclude with *My Man Tom*, of which Mrs. Anderson, pretty and lively, and Mr. G. Wild with considerable Reeve-ish humour, are the main supports.

\* Published by E. Moxon.

**Hanover Square Great Concert Room.**—On Friday the 7th, Mr. Benedict's Musical Soirée was crowded to excess. In addition to Mr. Thalberg's magnificent pianoforte performance all the musical talent in London assembled, and lent their aid during the evening. Messrs. Benedict, Blagrove, and Lucas, opened the concert with Mayseder's fine trio in B flat, which was exquisitely played. Madame Stockhausen, Madame F. Lablache, Mrs. Toulmin, Signora E. Grisi, Misses Clara Novello and Masson, Mrs. B. Hawes, were all in full voice, and sung delightfully. Also, Mr. J. Bennett, Mr. Parry, jun., and F. Lablache. Mr. S. Shultz played a solo on the Spanish guitar in beautiful style. We must give a line to a Mlle. De Varny, who possesses a fine voice, but upon whom we will not pronounce judgment until we have heard her again, this being her first appearance. The whole affair went off with great and well-deserved success.

**Quartet Concerts.**—On Thursday evening, the first of a series of these agreeable concerts was given. Beethoven's quartet, in G major, was finely played by Messrs. Blagrove, Gastie, Dando, and Lucas (two violins, viola, and violoncello). Hummell's septet, in D minor, gave Mrs. Anderson's pianoforte playing a fair display, and the audience an opportunity of warmly welcoming their old favourite Lindley. The vocal music was confined to Miss Masson, who was much applauded in "The Sea hath Pearly Treasures," with horn obligato, beautifully executed by Mr. Jarrett. Madame Stockhausen was deservedly *encored* in a German melody, by Schubert.

#### VARIETIES.

**Mr. Catlin's Exhibition.**—We regret we have not room this week for an account of Mr. Catlin's very interesting lectures on the habits of the North American Indians, the second of which was given on Thursday evening. The daily Exhibition continues to be very attractive, and is indeed one of the most curious and instructive ever opened in London.

**Nuptial Paper.**—Among the inventions to commemorate the marriage of her Majesty, our industrious and ingenious friend Schloss (of the *Bijou Almanac*) has produced a new engraved note and letter paper, on which the portraits of the Queen and Prince Albert are very neatly done "in little," and surrounded by an elegant scroll ornament, which looks exceedingly pretty. The design is stated to be by a German artist.

**Illumination Joke.**—On the night of illumination in honour of her Majesty's marriage, among the devices was one that appeared at No. 16 in Queen Square;—it was a transparent painting of some vessels sailing about, with the motto below,

"SUCCESS TO SHACKS."

*The Address of the Imprisoned Sheriffs to Charles Green, Esq., the Aeronaut.*

In the Nassau Balloon,  
In a voyage to the moon,  
With what joy should we be elated!  
Yes! better by far,  
Take our seats in that car,  
Than thus remain incarcerated.—I. Srv.

*Shaksperian Coincidences with Horace.*

"Impossibility, to make what cannot be, slight work."  
*Coriolanus.*

"Nil mortalibus arduum est."—Ode 3, lib. iv.

"Barren winter with his wrathful, snipping cold."  
*Second Part of Henry VI.*

"Jam satis terris nivis atque diræ grandinis."  
Ode 2, lib. i.

"Solvitur acris hyeme grata vice veris."—Ode 4.

"The time of life is short; to spend that shortness  
basely, were too long."—*First Part of Henry VI.*  
"Vite summa brevis spem nos votat inchoare longam."  
—Ode 4, lib. i.

E. W.

#### Riddles for Naturalists.

"Good or bad: all good for laugh."—*Bembo.*  
Why is a black dog like a perpendicular fountain?—  
Because it is a jet d'eau.  
What quadruped would be a good substitute for a candle?—*The Taper.*  
Why is the knock of an importunate creditor like a hedge-sparrow?—*Because it is a dun-cuck.*  
Like what birds are a couple of milk-paths?—*Toucans.*  
Why would a ban upon London be like a parrot?—*It would be a city curse (Paltacus).*  
What disorder most resembles a bird?—*The thrush.*  
When does a porter carry a bird on his head?—*When he has a knot on.*  
What genus of birds does a parson resemble?—*Pastor.*  
What genus of birds resembles compassion?—*Pitta (pity).*  
What genus of insects is most like a chimpanzee?—*Apis (ape is).*  
Why should we suppose Mount Etna to be full of caterpillars?—*Because it throws up so much lava (arose).*  
Why is the catch-weed beetle like a watch?—*Because it is a time-marker (Timarcha).*  
Why is a man who catches moths like a woman with a family?—*Because he is a moth-er.*  
Why is the clover of your mother's sister like a quadruped?—*Because it is an aunt-clope.*  
Like what flower is a dreadful stormy night?—*The night-blowing cereus.*  
Like what vegetable was Lord Abinger when racing?—*A scarlet-runner.*  
A pastry-cook can make every sort of pie excepting one, and which is that?—*A meg-pie.*  
What quadruped is that which can never grow old?—*The gnu.*  
JAMES H. FENNELLS.

#### LITERARY NOVELTIES.

In the Press.

**The Faithful Dog; a Tale for Youth, enforcing Humanity to Animals.** By the Author of "Memoirs of my Dog."

#### LIST OF NEW BOOKS.

Solutions of Dr. Hutton's Course of Mathematics, forming a Key to that Work, by T. S. Davies, Esq. 34s.—  
J. Wilson's Influences of the Corn Laws, 2d edition, 8vo. 3s.—  
W. Coulson on Diseases of the Bladder and Prostate Gland, 2d edition, 8vo. 7s.—  
Elements of the Practice of Medicine, by C. Lindrick, M.D. Part I. 18mo. 5s.—  
Guy's First Geography, 18mo. 1s.—  
The Spitfire, by Captain Chamier, 2d edition, 3 vols. post 8vo. 12. 11s. 6d.—  
Lady Jane Grey, an Historical Romance, by T. Miller, 3 vols. post 8vo. 12. 11s. 6d.—  
Dr. G. Croly's Life of Edmund Burke, 3 vols. post 8vo. 18s.—  
Montacute; or, a New Home, by Mrs. M. Clavers, 3 vols. post 8vo. 18s.—  
Young Naturalist's Journey, by Mrs. Loudon, square; 4s.—  
Selections from the Works of Dr. Donne, f.cop. 4s.—  
Treatise on Insects Injurious to Gardeners, &c., by V. Köllar, Translated by Loudon, 12mo. 7s.—  
The Lady's Assistant in Knitting and Netting, by Mrs. Galignani, 5s. 6d.—  
Recreations in Astronomy, by the Rev. L. Tomlinson, f.cop. 4s. 6d.—  
Progressive Exercises in Latin Elegiacs and Heroics, by Rev. J. Edwards, f.cop. 3s.—

CHARLES HENRY ADAMS.

#### ADVERTISEMENTS.

Connected with Literature and the Arts.

#### BRITISH INSTITUTION,

PALL MALL.  
The Gallery for the Exhibition and Sale of the Works of British Artists is open daily, from Ten in the Morning until Five in the Evening.

Admission, 1s. Catalogue, 1s.  
WILLIAM BARNARD, Keeper.

#### CATLIN'S NORTH AMERICAN INDIAN GALLERY, Egyptian Hall, Piccadilly.

Containing 500 Paintings, made by his own hand, during Seven Years' Travel and Residence amongst the Wildest Tribes of Indians in North America. And also an immense Collection of Indian Curiosities—Dresses—Weapons, &c.: and a Crow Wigan, twenty-five feet high—a magnificent specimen.  
Open daily from 10 to 6.—Admission, One Shilling.  
Mr. Catlin's Second Course of Three Lectures, on the Manners and Customs of these people, will be delivered this week, on Tuesday, Thursday, and Saturday Evenings, commencing at Eight o'clock.  
Tickets for the Course, 5s.—Single Tickets, 2s. 6d.

#### OSLER'S PATENT MERCURIAL LETTER GAGE, or LETTER WEIGHING MACHINE.

This novel and unique invention, combining elegance with simplicity, denotes instantaneously the weight of a letter, or other light article, without adjustment.

Of the various inventions to meet the Post-Office regulations, and ascertain in the readiest manner the weight of letters, we have seen nothing to compare with the above for elegance, simplicity, and precision.—*Vide Literary Gazette, Jan. 18, 1840.*  
Sold by most Booksellers, Stationers, Dressing-Case Makers, and Fancy Warehouses.

Sole Agents to the Manufacturers, Messrs. Richard and Wilson, Wholesale Stationers, St. Martin's Court, Leicester Square, London: to whom the trade are requested to address their orders.

#### POLARIZATION OF LIGHT.

#### TO PUBLIC INSTITUTIONS,

SCHOOLS, &c. Mr. J. F. Goddard begs to announce, that he is open to Engagements to deliver a Course of Three or Four Popular Lectures on the Polarization of Light, with Numerous Experimental Illustrations, by means of his Polaroscope and other novel Apparatus.

Lecturer on Optics, &c. Royal Gallery of Practical Science, Strand, London.

Mr. Goddard takes this opportunity of informing his Scientific Friends and the Public, that, having recently succeeded in simplifying his Polaroscope so as considerably to reduce the cost of construction, and adapted it to Mr. Cary's Portable Oxyhydrogen Microscope, it may be had either separate, with (Oculars), or together with the Microscope, &c. &c.: and are sold for Mr. Goddard by Messrs. Watkins and Hill, 5 Charing Cross, London.

#### GENERAL CEMETERY, Kensal Green,

Harrow Road, one mile and a half from Paddington Church. In this Cemetery, established in the year 1832, Members of the Church of England and Dissenters are interred, either in consecrated or unconsecrated ground, as may be required, with the use of Chapels, and the right of parties bringing their own Clergymen, and the advantage of a Burial Register for all Denominations authorized by Act of Parliament, of the same validity as the registers of parishes. A new Chapel with Catacombs, for the interment of 10,000 persons, was opened in June 1838. Catacombs and ground for graves may be obtained either in Perpetuity or for Single Interments, viz.:

Private Catacomb .....	215 15 6
Single Interment in Catacomb .....	6 0 0
Private Family Grave, with privilege of placing Monument or Grave-Stones .....	5 5 0
Single Interment in Grave .....	1 5 0

All inclusive of Usuary Fees.

Ground for Vault, or Brick-Grave ..... 15 15 0 |

Any further space of ground, at per square foot 0 8 0

No fees are payable to any parish by parties interring in this Cemetery.

The Grounds are open for inspection at all times, except during Morning Service on Sundays. Any further information may be obtained at the Office of the Company, 93 Great Russell Street, Bloomsbury.

C. B. BOWMAN, Secretary.

#### ROYAL WEDDING SUN.

#### SOMETHING NEW. On Friday and

Naturday a vast number of Money Letters for "Royal Wedding Sun" was received at the Sun Office, but this day the number has increased beyond all calculation; so much so, indeed, that the Post-Office authorities refused to deliver the Letters without an order from the Proprietor of the "Sun."

8 New Burlington Street, February 15.

**MR. BENTLEY WILL PUBLISH DURING THE PRESENT MONTH  
THE FOLLOWING NEW WORKS.**

**I.**  
**TRAVELS IN KOORDISTAN, MESOPOTAMIA, &c.**

INCLUDING

An Account of the Parts of those Countries hitherto unvisited by Europeans, with Sketches of the Character and Manners of the Koordish and Arab Tribes.

By J. BAILLIE FRASER, Esq.

Author of "The Kuzzilbash," "A Winter Journey (Tatar) to Persia," &c. 2 vols. 8vo. with Engravings.

**II.**  
**THE PATH-FINDER; OR, THE INLAND SEA.**

By J. FENIMORE COOPER, Esq.

Author of the "Pilot," "The Prairie," "Last of the Mohicans," &c. 3 vols. post 8vo.

**III.**  
**POPULAR DELUSIONS;**

OR, MEMOIRS OF THE FOLLY, INFATUATION, AND CREDULITY OF THE PEOPLE.

By CHARLES MACKAY, Esq. Author of "The History of London." 2 vols. 8vo.

**IV.**  
**THE COUNTESS; A NOVEL.**

By THEODORE S. FAY, Esq. Author of "Norman Leslie," &amp;c. 3 vols. post 8vo.

**V.**  
**ELEVEN YEARS IN CEYLON.**

Comprising SKETCHES of the FIELD SPORTS and NATURAL HISTORY of that COLONY, and an ACCOUNT of its HISTORY and ANTIQUITIES.

By MAJOR FORBES, 78th Highlanders. 2 vols. 8vo. with numerous Illustrations.

**VI.**  
The New Volume of the Standard Novels,  
Comprising

**THE VICAR OF WREXHILL,**

By Mrs. Trollope. With Engravings, price 6s.  
(On the 50th instant.)

**VII.**  
**THE SECOND VOLUME OF THE  
COMPLETE AND ILLUSTRATED EDITION  
OF HORACE WALPOLE'S LETTERS.**

(On the 50th instant.)

**NEW WORKS JUST PUBLISHED:—**

**I.**  
**COUSIN GEOFFREY, THE OLD BACHELOR;**

A NOVEL. Edited by THEODORE HOOK, Esq.

Author of "Jack Brag," "Maxwell," "The Parson's Daughter," &c. 3 vols. post 8vo. embellished with a Portrait of Mr. Hook.

**II.**  
**Norway and the Norwegians.**  
By R. G. Latham, Esq. Fellow of King's College, Cambridge. 2 vols. post 8vo.

**III.**  
**Sam Slick's Letter-Bag of the Great Western.**  
Post 8vo. bound, price 10s. 6d.

"We are compelled, on this occasion, to let Sam Slick have all the talk to himself; for his new work is so full of excellent readable and extractable matter, and so infinite in its variety, that we cannot spare room even for a running commentary."—*Athenaeum*.

**IV.**  
**Mrs. Trollope's New Novel, One Fault.**  
2 vols. post 8vo.

"'One Fault' will be inferior to none of Mrs. Trollope's novels in popularity. It forcibly inculcates a great moral lesson."—*Morning Herald*.

**V.**  
**Memoirs of Sir Sidney Smith, K.C.B. &c.**  
By the Author of "Rattlin the Reefer." 2 vols. 8vo. with Plates.

"The 'Hero of Acre' has but to be mentioned, and we at once associate his name with daring exploits and enterprize, with undaunted courage, with sad imprisonments, and with hair-breadth escapes. The brilliant career which these interesting volumes record, is well worthy of perusal."—*Morning Chronicle*.

**VII.**  
**Pitawiggins; a Novel.**

By the Author of "Sydenham." 2 vols. post 8vo.

"This novel, in plan, is an English 'Gil Blas'—a class of fiction well adapted to portray persons and society. The filling up of the work is clever, the incidents various and sufficiently diverting; while the narrative bears about it a great resemblance of reality."—*Spectator*.

**VII.**  
**The Ingoldsby Legends; or, Mirth and Marvels.**

By Thomas Ingoldsby, Esq.

1 vol. post 8vo. bound, with numerous characteristic illustrations.  
"One of the cleverest works of the day. It abounds in wit and humour of the first class."—*John Bull*.

**VIII.**  
**Memoirs of the Court of England under the Stuarts.**

By J. H. Jesse, Esq. 2 vols. 8vo. with Engravings.

"This pleasant and entertaining work in form is a portrait gallery. Its essential characteristics are anecdote, personal peculiarities, gossip, and scandal. Its subjects are the royal family, and the most distinguished ministers, courtiers, and court ladies of the time."—*Spectator*.

**IX.**  
**Memoirs of his Own Time;**  
Including the Revolution, the Empire, and the Restoration.  
By Lieut.-General Count Mathieu Dumas. 2 vols. 8vo. with Plates.

**RICHARD BENTLEY, NEW BURLINGTON STREET,**

**Publisher in Ordinary to Her Majesty.**

### REVIEW OF NEW BOOKS.

*The History of Christianity, from the Birth of Christ to the Abolition of Paganism in the Roman Empire.* By the Rev. H. H. Milman, &c. 3 vols. 8vo. London, 1840. Murray.

MANY critics make a parade of their superior knowledge, and it is, indeed, the fault of the great majority, that in order to approve themselves to the public as competent judges of the works before them, they are led to boast enough of their fitness for the task. It is a curious profession, as would readily appear to those who have the means, or will take the trouble, to watch its evolutions. The semblance of complete acquaintance with the subject is often obtained from the preface of the very author under review; whilst the profound wiggishness of more extensive reading and research, is gathered into curl from his own hints and references. The magical *Our* analysis is a run over the heads of chapters; *Our* synthesis, a summary of the page top-lines; and *Our* view (if friendly), opinions changed from the writer's language into our own; (if adverse), the opposite, expressed in words like these:—"Such are Mr. So-and-So's declared objects, in which we do not think he has succeeded," or, "in which, according to our notions, he has utterly failed." From our place behind the curtain we see so much of this, that we cannot help laughing at the gravity with which the trick is performed, and the wiseacre gullibility with which the "Our Readers" swallow these oracles of justice and wisdom. We do not allude to other sources of impartial criticism, such as are supplied by authors, friends, publishers, rivals, and enemies,—a goodly train of guides for the enlightened public! Their meritorious performances abound in every quarter, and may be cited as the finest examples of intelligence, benevolence, disinterestedness, impartiality, and candour. For who can know more of the work than the author? who exercise a more encouraging spirit than the friend? who exceed the publisher in purity? who be more acute in the detection of errors than the rival? or who bestow the rod upon offence with more cutting efficacy than the enemy? Thus, out of the five varieties, all the canons of just and sound criticism may surely be illustrated; and it is edifying to us to observe how very generally they are exhibited, and how very thankfully they are accepted, especially when accompanied by a spice, or rather by a lump of self-praise, a touch of pseudo liberality, or an ex-cathedral asseveration of infallibility. All three in one article are irresistible.

For ourselves, it is with sorrow we have to confess our incompetency to deal with this History. We have read and pondered over it for many an hour; we have noted parts, and reflected on the plan, execution, and scope of the whole; yet we cannot tell what truly to say of it. Of learning there is no lack; of ability there is amply sufficient. But we do not feel satisfied with the work. It broaches a multitude of speculations upon points of the most vital interest to the Christian world; it discusses a multitude of biographical and his-

torical questions of equal importance; and it revolves on deductions, and doctrines, and creeds, differing in every degree, and, in some instances, wide as the poles asunder. Having thus unsettled our minds, the pains taken to reconcile them to the line of safety and truth are not always convincing. We are not *in medio tutissim*; but, like the needle in the compass, we veer and quiver round in every direction, and unlike the needle, we have no true north on which to fix at last our wavering vacillations. Our perturbed traverses have nowhere to rest: the coffin of Mahomet is no more between heaven and earth than is our faith between the Sceptical and the Catholic. Mr. Milman seems to us to have attempted, with calmness and impartiality, and without dogmatism and bigotry, to weigh the evidences *pro* and *con* in regard to the many essential topics embraced by his inquiry; and endeavoured to trace a middle course among the conflicting elements. That course we consider to be impossible. Without going to the extremes there can only be one right and one wrong, one truth and one falsehood. We cannot go near the German speculatists, and doubt the identity and existence of the very foundations of Christianity, and, at the same time, credit only so much of what is left as will constitute the orthodox believer. Sap one miracle, and what becomes of the rest? Afford natural explanations of what have been upheld as Divine interpositions, and the fabric of revelation is overthrown. If certain of the Evangelists be apocryphal, and certain of the Apostles never lived; if gospels are of most questionable origin and date; and if hitherto respected and acknowledged facts are nothing but ideal inventions, it is of no use trying to sift out enough of the real and credible to support the miraculous mission and works of the Lord Jesus Christ. In trimming the balance, therefore, we fear Mr. Milman has given up so much to one, and conceded so much to another, that neither Strauss nor Evangelical will be satisfied with his labour; but, on the contrary, every sect, taking its own particular view, will discover much whereon to pride itself, and at the same time disagree with the conscientious compromise of the reverend author.

Such being the sense we entertain of this learned and sterling production as it is likely to effect polemics, it is our duty to offer the sincere tribute of our admiration to the spirit in which it is conceived, to the talent with which the investigations have been conducted, and to the comprehensiveness and mass of information, of the deepest value and interest, which distinguish it throughout. We have delivered our sentiments frankly, yet with much diffidence, for we really feel what we have stated—our incompetency to decide the vexed questions so abundantly mooted; and even were we disposed to reason upon them, we are perfectly aware that our little sheet offers no proper arena for such controversies. That Mr. Milman's book will be a standard one in English literature is certain, from its nature and his fame; and our dismissal of it with so brief a notice is but a proof of the sincerity of

our avowal, that we could not grapple with its magnitude and importance. A sequel is announced, which will be looked for with impatience and anxiety; and heartily do we wish the author health and strength to finish it for the edification of the world.

*A History of the Church.* Translated from the German of the Rev. J. J. I. G. Döllinger, D.D. Professor of Theology in the Royal University of Munich, by the Rev. Edward Cox, D.D. of St. Edmund's College, Old Hall Green, Herts. Vol. I. 8vo. pp. 263. London, 1840. Dolman; Jones.

THIS volume comprehends a considerable portion of the early history of the church, and may not inappropriately be read in connexion with Mr. Milman's work. The schisms and divisions which took place within the first two centuries of Christianity, are described from Eusebius and other ancient writers, and the publication is dedicated to "the Right Rev. Thomas Griffiths, D.D. Bishop of Olena, and Vicar Apostolic of the London District."

*Southwold and its Vicinity, Ancient and Modern.* By Robert Wake, M.R.C.S.L. 8vo. pp. 420. 1840. Yarmouth, Skill; London, Simpkin, Marshall, and Co.

A PERSON of the name of Mr. John Poole, some short while ago, published an account of the celebrated town of Little Peedlington, ancient and modern, but chiefly the latter, the idea of which we have no hesitation in declaring must have been stolen from Mr. Wake. Uninformed people may fancy there is a possibility, as the history of Southwold has appeared last, that Mr. Robert Wake may have stolen the idea from Mr. John Poole; but if they reflect on the well-known Paul Pry habits of the latter, we think they will hardly hesitate in fixing where the delinquency exists. Is it probable, we would ask, that Wake would follow in the wake of a Poole? or is it not more like that Poole would be wide-a-Wake to an example of this sort? Our opinion is settled; and among the trumpery imitations so plentiful in our day, we can detect none more disgraceful than this.

There are, however, points in which the plagiarist has fallen far short of the original. For example, we have in this volume a capital map of "Southwold; latitude, 52° 20' north; longitude, 1° 40' east; drawn and engraved expressly for Mr. Wake's history of Southwold and its vicinity," the importance and interest attached to which are not to be doubted. Here we see "the common" extending far away towards the S.W.; "the corporation marshes" still further in the same direction, and leading to illimitable space; on the W.N.W. is "Bus Creek," kissing the Wangford Road; the "open fields" (such as the polar navigators never could discover) occupy the north; "Tami-rick Villa" is sweetly situated above "South Green House;" and the terrible "Gun Hill" enshades the lovely "Marine Villa;" "the Mill" and "Meeting-house" lanes run almost due east and west; whilst the Swan and Crown Inns face blandly to the south. The way to "the Brick Kiln" is accurately laid down;

and "the Jetty Road," and "path to Walberswick," bound "the Salt Marshes" in the most indisputable and satisfactory manner. "Camel's Lane" (*quære*, Campbell's?), "the Station House," the "Subscription Library," and "Skillman's Hill," are so clearly mapped, that no mistake can arise concerning them; and, in short, every locality of this wonderful place is indicated in a style to delight the geographer, and gratify even topographical minuteness.

The author seems, indeed, in every respect to be properly and deeply sensible of the momentous nature of his undertaking, and of the absolute necessity for treating it with profound devotedness, after unwearied research.

"You are aware (he says in his dedication to the mayor), you are aware that I have stopped at no exertion, nor spared any expense, to attain what was attainable; and which, although it be not all that is required, will be found, I trust, of sufficient importance to warrant my hope that I have not laboured altogether in vain."

Assuredly not! On the contrary, we are almost tempted to give him credit for having done more than "all" that could be required! Again, in the opening, still impressed with a sense of the magnitude of his task, Mr. Wake observes:—

"In undertaking the history of ancient and modern Southwold, we feel ourselves committed to a task which is in no ordinary degree arduous. The expectations of the public, with which the announcement of our purpose has been so largely and flatteringly greeted—the noble, learned, and highly distinguished names which have accordingly swelled our subscription list, and have honoured us with their encouraging patronage—and the deep sense of consequent responsibility under which we have not unwillingly pursued our researches and labours, have conspired to impose a tribute upon us, for the discharge of which we acknowledge our best exertions and all our resources to be but little competent. Of so high-minded a class, however, are the friends who have come forward to cheer and support us under our difficulties, that we can freely trust to their indulgence, where any want of ability on our part may occasion such failure as too often results even to the sincerest wishes and efforts. The work before us involves a variety of subjects, and the order in which we propose to consider them may be here briefly submitted. The localities and situation of our interesting town, with the advantages which it commands for sea-bathing and visitors, whether in quest of recreation or health, will be taken as matter for this opening article. Our beautiful church—the foundation of which connects the history of Southwold with that of six centuries, and which is so striking an object as to challenge the admiration of all beholders—will naturally follow, and afford us the opportunity of noticing such other places of worship, and schools attached to them, as are in present operation. The corporate history of this ancient borough; the memorable Sole Bay fight; the natural productions common to the place and its vicinity: such local incidents, chronologically arranged, as seem deserving of record, will be respectively treated of. The sea-destroyed, but not-forgotten, celebrity and importance of Dunwich, Covehithe, Easton Bavent, &c., whose close proximity to Southwold must attach veneration to it, if for their sakes only, will next engage our attention. And, having conducted our visitors through such rides and drives in the Hundred of Blything as are, locally and historically, deserving attention,—submitting,

as we pass, brief notices of the several churches and the principal adjoining towns,—we shall sum up the whole by a compiled and connected view of such East Anglian associations as have combined, from remoter times, to commingle the records of our neighbourhood with most of the leading events of British history."

And still further a-field:—

"Other notices, besides those contained in the two preceding chapters, may be reasonably demanded of us for a more complete elucidation of the corporate history of Southwold. Among the additional notices deemed to be necessary to the object in hand, our readers (at least some whom we should shudder to disappoint) will naturally expect to find the names of such respected individuals as have successively served in the higher corporate offices. Some notice must likewise be taken of whatever records and documents may have been preserved in the corporation archives, from the rage of fire, or the wrecks of time, or mayhap from less justifiable wrongs which may have been heretofore inflicted. 'The muse on foot' (the *musa pedestris* of history), will further require of us, as we have the honour of treading in her slow-paced and well-measured footsteps, to perambulate the bounds to which the corporate jurisdiction extends its venerable appliances. And in the silent and contemplative mood which the solemnity of the procession must needs impose, we shall have ample time to recall to a memory, naturally treacherous, the recent provision which, in the shape of by-laws, the corporate wisdom hath made 'for the good rule and government of the borough' of Southwold. Our repugnance to grapple with the host of details so historically solid and panopied, is not a little overborne by the courage reflected to us from the fact that they will contribute, each in its proper order, to the triumph which the historian achieves, when it eventually appears that the number of his difficulties has been outnumbered by his resources; and when the difficulties themselves have become instrumental to his more successfully combining the past and the present together. With this hope, not rashly entertained, we proceed."

Well might the author shudder at the vast attempt; for we are so frightened, as to be absolutely afraid to follow him. How poor, how little does the historian of Little Pedlington loom after this: a street ballad compared to an epic! But let us come to some of the interesting facts connected with the now never-to-be-forgotten Southwold:—

"The following extract from the treasurer's cash-book, containing the town accounts, will shew that there is some land in the town held under the manor of Reydon. 'In the Easter ending 1830, paid fine to Earl Stradbroke admission of four new feoffees to copyhold land, part of Woods-end Marsh, sixty-five pounds, twelve shillings, and sixpence. The sum of one shilling and sixpence is yearly paid to Lord Stradbroke, as 'quit-rent Reydon manor.' Query, whether this land held of the manor of Reydon was not a part of the manor, of which the monks of Bury held one moiety, and a fourth of the other moiety?'"

The monks are all buried, and who can resolve this mighty question? It excites melancholy feelings: let us pass to the beautiful present:—

"Picturesque scenery of the 'sea-washed' Southwold. The most pleasant point for enjoying, as well as observing them, is unquestionably 'The Marine Parade.' Along the entire range of it are delightful walks, and especially

along St. Edmund's Hill, the Gun Hill, and the Ladies' Walk in front of the Marine Villa, onwards to the North Cliff. Here, whether on sand or sward, the lover of nature may saunter at will; and when he feels disposed to sit, there are commodiously placed benches, where he can pursue his meditations as placidly as yon sweet ripple dances so lightly under the sunbeams. How extensive and beautiful is the view which now presents itself! The splendid grandeur of the German Ocean on the one side, with its ever-heaving bosom; its hundreds of vessels, moving in all directions, from the slight fishing-boat and single-masted skiff, to the gallant gun-ship and adventurous foreigner, forms a scene of admiration which is quite as untiring as it is refreshing and various. On the other hand, residence after residence presents itself—ivy-clad, or flower-fronted, or tree-embowered, as it may be—in fair and fantastic perspective. Neatly latticed windows, impending balconies, picturesque garden plots, closely shaven lawns, interspersed shrubs, distant plantation clumps, and gliding parties of fashionable company, afford attractions to the sea-side musings at Southwold which never fail to beguile listlessness, or to enchant the imagination. But the deep and dark blue ocean—oh, there is repose upon its vast expanse, and enjoyment in its unmeasured sublimity, which the pen cannot portray, and the tongue cannot enunciate."

What a fine image, the Bencher pursuing his placid meditations like a dancing ripple! There are subjects for twenty noble paintings in this one brief extract! and more anon, for Mr. Wake assures us:—

"Without designing to be partial historians in this matter, and without the slightest ambition to hold any place among the ranks of highly colouring painters, we freely declare our conviction that, to the casual visitor, the landward view of Southwold possesses a superiority over most other sea-coast and bathing quarters in England. One reason, which we may suggest, arises from the number of ornamental shrubberies, and verdant and flowery parterres, and fruit-bearing trees, which are so happily cultivated even amongst the emulous lodging-houses."

The emulous lodging-houses "is (as Hamlet's gravedigger says) good;" and we read on with delight of the localities of the distinguished in literature, and glorious in arms:—

"The other prominent objects which it shall suffice us to specify here—and that for no other reason than that every stranger inquires about them—are the commanding appearance of the Rev. Henry Ulthoff's residence, 'South Green House;' the stately proportions of 'Lenny House,' lately purchased by the Rev. T. Sheriffe, and now occupied by Mr. Skill, for library and reading-rooms; 'Jessamin-Lodge,' with its neat portico, occupied by Lieutenant Ellis; and 'Tamarisk Villa,' with its green-house, and verandah, and prettily embowered front, lately purchased from the venerable Archdeacon Philpot, by the author of the present history."

The succeeding remarks seem to be curious as connected with the notice of these eminent citizens of Southwold, for the author continues:—

"In venturing these cursory and imperfect notices, we may boldly appeal from them to the experience and good taste of any visitor, whether the want of vegetation can be chargeable to our Southwold residences."

Now we can see how this may apply to *Green-House*, *Jessamin*, and *Tamarisk*; but

what the state of vegetation can have to do with Lenny House, the Rev. Mr. Uthoff, the Rev. Mr. Sherriffe, Lieutenant Ellis, Archdeacon Philpot, and Mr. Wake, is beyond the compass of our genius. The following valuable information, fortunately, is not:—

"The home consumption of malt, under the name of Crisp's ale, is very considerable. This refreshing, if moderately used beverage, is universally admired for the purity and delicious flavour supposed to be imparted to it, not less by the unadulterated genuineness of its composition, than by the intrinsic purity of the water which enters into it."

This interesting intelligence is followed by some statistical statements, which, we trust, will be brought under the notice, and into the published Transactions, of the Society in London. We have only room for a few examples of facts, from being made acquainted with which our readers, however, must derive great pleasure.

On the Fair Days at Southwold (we mean the days on which fairs are held, and not days free from rain, of which the memory is now lost in England), "Ballad Singers" pay for their "standing," *twopence*; "Quack Doctors on horseback," *one shilling* (other beggars on horseback not charged); "tables with lotteries," *fourpence*; "Quack Doctors" (on foot), *sixpence*; and among the "gaol fees," we find that "all other troubles are to be paid REASONABLY—0.0."!!

Bathing, of course, demands the grave attention of the author, and he says, "The Bath-rooms must not be forgotten in a notice like this. For assuredly there must remain a refreshing recollection of them in the minds of all, by whom use has been at any time made of their invigorating accommodation." But the sea-dip is of yet mightier import, and is not to be taken up in a light rippling manner. No, "The discussion in the 'History of Southwold,' of points so scientifically obscured from the eye of the general reader, would be a sacrifice which, however desirable on other occasions, the historian cannot consent to make to 'the Faculty.' For us it may be enough to say, that the chief efficacy and benefit to be derived from the bath—as indeed from all other inventions which a benign Providence has placed within the compass of man's wants and weaknesses—will be found to be inseparable from a judicious, and well-timed, and moderate use of it." It is, we confess, the first time we ever heard that Providence *invented* the bath or plunge into the sea; but, however this may be, we have the authority of Mr. Wake for stating that—"All the ends for which this salutary application has been successfully employed, will be served by a single act of immersion."

The reflections on Southwold Church are inimitably fine; and the style striking, alike for its simplicity and grandeur. "The consecration of science," says the author, "may pass from the bar of religious criticism without being visited with the anathemas of unmitigated condemnation. The nobler arts of long-matured refinement can scarcely be thought, even in the estimation of the most sober-minded, as inapplicable and out of place in edifices which have been separated, under the influence of heart-refining christianity, to the worship of the most glorious as well as the most gracious of beings."

Contrast this serious and affecting language, so suitable to the subject, with the light and playful manner in which Mr. Wake treats of mere secular and worldly themes. For instance,

walking the municipal boundaries:—"The august ceremony of thus officially defining the locality over which the Southwold corporation have so long and peaceably extended their jurisdiction, was performed consistently with a very ancient usage."

"The procession left the council-chamber about noon."

Walked at the back of the beach for about twenty yards to the south-west of the pier, near to a house built by Colonel Barne, of Dunwich, on a place called Ferry Knowl; and then turning at a right-angle, passed over a pool of water, occasioned by the overflowing of the tide, by means of a boat launched for the purpose, and thus to the bank of the river, near the cut recently made by the commissioners of the harbour, which runs towards the Dunwich Creek; and there again taking to the barges, proceeded up the river Blyth, keeping as near to the south-west bank as the water would permit, and landed on the north-west of Black-shore Quay, where a very numerous party of men, women, and children, were regaled with a barrel of strong ale [Crispa!] and plum buns." After some hearty cheering, &c. "The procession continued its route, and passed through the arch of the bridge thrown across the creek at the entrance of the borough, and were cheered by the persons there assembled to witness the scene; and thus the party proceeded till it arrived at the end of the creek nearest the sea, where the mayor and corporation disembarked and walked to the boundary-post, which stands on the beach, and in a direct line, bearing upon the steeple of Blythburgh Church. Against the boundary-post, the somewhat ridiculous, but very guiltless, operation of bumping was performed upon the mayor and his clerk, and the greater portion of the body corporate present. The ceremony is performed by men seizing upon one of the party, *volens volens*, who is lifted off the ground, and after a preparatory swing or two, to give a due momentum, the unlucky wight is brought in contact with the post 'à posteriori.' This exhibition, though harmless enough, some thought would have been better observed 'in the breach (rather than on) the performance.' But the party were told they must submit, as our forefathers had done so before us, by whom it was deemed the best manner of impressing the terminal fact upon the memories of the rising generation."

Oh, wisdom of our ancestors, still perpetuated by the magnates and commonality of illustrious Southwold! Let other corporations enjoy their bumper toasts on holydays; but let the glory of bumper posts be thine alone. May thy mayor, after the "guiltless" ceremony, choose and enjoy the easiest chair; thy corporators be softly seated; thy clerk anointed as well as appointed; and thy rising generation be more solemnly impressed with terminal facts, than the youth in any other portion of Great Britain! Such is our prayer; and when next the precious feat is performed,

"May we be there to see."

Sure we are, that the result of so instructive a compact by contact must be the due observance of all their duties on the parts of the initiated, without the slightest breach of contract; that the post must ever be venerated by the aldermen, councillors, clerk, burgesses, and sergeants-at-mace, and be an object of pious worship to the right worshipful the mayor.

Our author is quite equal upon natural history to the other divisions of his everlasting labours. The extraordinary animals which roam the country are scientifically described; but we must let an extract speak for the rest:—

"The natural history of Southwold is for the most part the natural history of the county, and is to be found in various books already written. The natural history of Southwold itself is perhaps sufficiently distinct to be somewhat interesting, and that, therefore, we shall principally touch upon. Of quadrupeds, exclusive of domestic animals, the local history is brief. The common hare (*lepus timidus*), which, before the introduction of the new game-laws, was abundant in the neighbouring parishes, has sometimes been found in the marshes at Southwold; and we have a tradition of one regularly swimming over the river from Reydon, to enjoy the security of a seat upon the common. The rabbit (*lepus cuniculus*) is somewhat numerous with us, having occasionally the protection of the town-council, by whom a portion of the corporation land has been sometimes appropriated to the nuisance of a warren, to the exclusion of more useful occupiers: an annual rent of some 5*l.* or 10*l.* appears, however, to have been the temptation. The hedge-hog (*erinaceus europæus*), the common rat (*mus rattus*), the blackwater rat (*mus amphibius*), the field-mouse (*mus sylvaticus*), and the common mouse (*mus musculus*), nearly complete the catalogue: the fourmart, or polecat (*mustela putorius*), in local dialect termed a 'lobster'; and the weasel (*mustela vulgaris*), in the same dialect called a 'mouse-hunt,' have, however, been known 'to vex' the rabbits: and it is presumed that the mole (*talpa europæa*) must have had its domicile in the borough, as a mole-catcher was regularly retained by the old corporation, whose accounts shew the payment (for half a century) of an annual stipend of one guinea for his services."

The hare, rabbit, hedge-hog, rats, mice ("such small deer"), and more rare polecats and weasels, are the Southwoldian *fera natura*; and it is lamentable to think, that from a place so attached to antiquities, the mole (*talpa europæa*) should have vanished. The confounded Reform Act must have put their "boroughs" into schedule A. In ornithology, Southwold is equally prolific and extraordinary:—

"The blackbird (*turdus merula*), and the mavis (*turdus musicus*), have been frequently known to nest in the precincts of the parsonage, whose majestic elms, some few years since, afforded a cradle to the rook (*corvus frugilegus*), which a more artificial taste in music has banished to the wood at Reydon: it still, however, occasionally appears amongst us, tempted, perhaps, by the larvae of the shad-borne beetle of Shakspeare (*scarabeus stercorarius*), which abounds and undergoes its various transformations on our uplands: tempting also the starling (*sturnus vulgaris*), which is sufficiently social to build in the roofs of our houses, flocking with others in autumn on our common, attended by the jackdaw (*corvus monedula*), and the hooded crow (*corvus cornix*), a visitor from the western isles of Scotland, or more probably from more northern countries, from whence it follows the woodcock. Besides the song-birds already mentioned, we may note our familiar friend the redbreast (*motacilla rubecula*), and the hermitess, as Wordsworth calls it; the wren (*motacilla troglodytes*), the hedge-sparrow, or shuffle-wing (*accentor modularis*), 'the muse's gayest pet,' the goldfinch (*fringilla carduelis*), and that innocent and stupid bird, the yellow hammer (*emberiza citrinella*), as somewhat rare amongst us; but the sky-lark (*alauda arvensis*), the tit-lark (*alauda pratensis*), and the linnet (*fringilla linola*), are numerous."

But even with the most charming of works

we must come to an end; and, grateful as we feel to the writer, we cannot imagine a preferable way of shewing it, than by concluding with a sample of the expressions of gratitude with which he rewards those who have enabled him to erect this literary monumentum ære perennius:—

“For the much-admired delineation of the maps in this work, and whose execution and beauty will speak for themselves, we are indebted to the well-known accuracy as a land-surveyor, and to the kind good offices as a neighbour, of J. G. Lenny, Esq. William Bardwell, Esq. the eminent architect, and, we have the pleasure of adding, a native of Southwold, has doubly obliged us:—first, by an exquisite drawing of our church; and secondly, by an accurate professional description of it, which, although with much labour and pains, we were happy to embody in our architectural notice of that justly admired edifice. And here, for the benefit of such persons as may have occasion to consult that gentleman professionally, we subjoin his address, which is No. 11 Park Street, Westminster;—and also an extract, in reference to him, taken from the ‘Encyclopædia of Architecture,’ as follows:—‘The author of that ancient work on ‘Temples, Ancient and Modern,’ has distinguished himself by the cottages erected for ‘The Labourers’ Friend Society,’ at Blackheath.’ Mr. Bardwell’s example, we regret to state, has not been followed in England as generally as might have been anticipated. Notwithstanding, cottages from his models have been erected (as we are credibly informed), even in our antipodes, and in numerous places of our British and American settlements. But our principal debt, as it merely remains for us to notice, has been, not unwillingly, although insolvently, contracted to the great erudition and well-applied literary abilities of the Rev. William Graham Cole, incumbent of the parish of Walpole. The versatile help afforded us by our intimate, and kind-hearted, and endeared friend—help, as large and indispensable to us, as it has been self-denying and disinterested on his part, cannot here be acknowledged to an extent, either compatible with the delicacy of our friend’s mind, or of our own feelings on this subject. The mention of his name, however, affords us the further gratification of mentioning a highly commended work, which has recently issued from his talented pen. We allude to ‘Church, Pastors, Patrons; or, the Establishment as God designed it.’ 12mo. cloth, pp. 260, price 4s. 6d. and published by Nisbett, Berners Street.”

Go, Mr. John Poole, of Little Pedlington, and hide your diminished head, whilst we re-echo the praise of one who thus could “Wake the living lyre.”

*Narrative of a Journey to Guatemala, in Central America, in 1838.* By G. W. Montgomery. 8vo. pp. 195. New York and London, 1839. Wiley and Putman.

DESPATCHED on a mission from Washington to Guatemala, the author has given us a plain journal of his route, which describes the face of the country from day to day, and contains a few particulars which appear to be well worth the better acquaintance of the public, including in that wide word—England, America, France, Spain, and Holland. Mr. Montgomery’s course may be briefly traced. He sailed from New York, touched at Havana, proceeded to Truxillo, thence to Balize, embarked in an English schooner, and landed at Izabal. From Izabal he travelled with several companions to Sacapa,

where they were obliged to diverge to Esquipulas to avoid the hostile Indians, who beset the direct road, and plundered and murdered all (especially foreigners) who fell into their hands. At Esquipulas the same peril existed, and a further divergence to St. Salvador was necessary. From St. Salvador to Sonsonate one officer was a sufficient protection; but from Sonsonate an escort of about fifty men was required to secure safety to Guatemala. The writer remained there nine days, and returned by a different route to Izabal, where he reimbarked for the United States.

Before noticing any of the incidents of this journey, we will afford our readers a general idea of the country called Central America.

It “extends from the eighth to the eighteenth degree of north latitude, and is bounded on the north by Mexico and the Bay of Honduras; on the east by the Caribbean Sea and Veragua; and on the west and south by the Pacific Ocean. It may be considered as a great isthmus separating the Atlantic from the Pacific, and connecting the two grand divisions of Spanish America. This isthmus presents a coast line of nearly a thousand miles on either side. Its breadth from sea to sea in no place exceeds four hundred miles, and at the narrowest point is scarcely one hundred. The situation of this country is peculiarly favourable for commercial intercourse with every other part of the world. On the south-western side its shores are washed by the Pacific; and the whole of the northern border lies open to the Atlantic and the Gulf of Mexico. Both the Pacific and Atlantic coasts are indented with numerous bays and harbours, of which the principal is the Bay of Honduras, in the latter sea, comprising the ports of Truxillo, Izabal, and Omoa, and communicating with the interior by means of a river which leads up to the lake called Golfo Dulce, already described. In the same bay is situated the port of St. Thomas, of which mention has also been made in another part of this narrative. On the Pacific shore is the Bay of Conchagua, and the ports of La Union, Realajo, Sonsonate, and Istapa; of which the latter is the nearest to Guatemala, but is only a roadstead, and by no means safe, owing to the heavy swell constantly rolling in from the ocean. The most considerable of the Central American islands are Bonaca and Ruatan, in the Bay of Honduras; the archipelago of Chiriqui, in the Caribbean Sea; and the islands in the Bay of Conchagua, in the south. The principal rivers are the Usumasinta, which falls into the Bay of Campeachy; the Polochie, which discharges itself into the Golfo Dulce; the Balize, the Hondo, and the Motagua, also called the Gualan, which flow into the Bay of Honduras; the Pasa, Lempa, and Esclavos, which contribute to the Pacific. These rivers are navigable for many miles into the interior. There are others of less note, which are not navigable. The country also abounds in warm and medicinal springs. The lakes most deserving of notice are those called Golfo Dulce, or Great Fresh-water Lake of Izabal and Amatlan, and especially the great Lake of Nicaragua, which is connected with that of Leon.”

This geographical view brings the American agent to speak of a subject of very great interest to the political and commercial world, which, fifteen or sixteen years ago, was brought forward in the *Literary Gazette*, and which has more recently attracted attention through the writings and exertions of Mr. Scarlett (see *Literary Gazette*, No. 1099): we allude to a plan for joining the Atlantic and Pacific Oceans,

by a communication across the Isthmus of Panama. Upon this great desideratum Mr. M. offers some important remarks. He says:—

“The Lake of Nicaragua is situated in the province of that name, at a distance of about a hundred miles from the Atlantic Ocean, with which it communicates by the river St. Juan. This river is now considered the most advantageous and most practicable point for establishing a connexion between the two oceans. It is believed to be navigable for vessels of three or four feet draft from its port to the lake, and for vessels of twice that depth, as far as the point where the falls commence, which are the great difficulty to be surmounted. The surface of the lake, according to the statement of a Spanish engineer who executed a survey in 1781, is forty-six feet above the level of the Pacific; its depth, about fifteen fathoms. The distance from that sea to the south-western extremity of the Lake of Leon, which communicates, as before stated, with that of Nicaragua, is, by the report of the said engineer, fifteen geographical miles, and intervening land is said to be sufficiently level to admit of the opening of a canal that should unite those lakes with the Pacific. Should the grand work of uniting the waters of the two oceans be undertaken and accomplished, a revolution would be caused in the commercial world, attended with results in the highest degree beneficial to the inhabitants of both hemispheres. This part of the continent would become the great thoroughfare of nations; and Central America would at once rise to an importance, both commercial and political, which otherwise she never can attain. Proposals for opening this communication were made by a company of English merchants in 1824. The following year similar proposals were made by some merchants of the United States. But in neither case does it appear that any specific attention was given to the subject by the government of the country. Subsequently, a proposition to the same effect was made by the Dutch, which was admitted, and the King of the Netherlands was to be stockholder to the amount of one half of the capital that might be invested. But, from whatever cause, this plan also fell through, and matters remain in the same state as before. It seems singular that a subject so peculiarly interesting to the United States should not have attracted more attention in our country. The enterprise, however, could only be successfully undertaken under the auspices of the government, and with the sanction of Congress. Were the subject properly recommended to the consideration of the national legislature, its importance could hardly fail of being perceived and duly appreciated; and the result, whatever it might be, could not but reflect credit on the administration. There is also reason to believe, that any steps that our diplomatic agent in Guatemala might be instructed to take towards a negotiation with the Central American government on this subject, would be met by that government with alacrity. There exists on the part of the people and authorities of that country a decided predilection for Americans, and for every thing that is American. They imitate the institutions, the laws, the policy, of the United States, and look up to this country as their great political model. They at one time solicited to be admitted into the Union as a new State in our Republic. While France and England are trying in vain to effect a treaty with their government, the United States have renewed, or are on the point of renewing, one that was concluded several years since. Thus, every

thing seems to favour and facilitate the accomplishment of an enterprise, which, besides enhancing in no slight degree the national glory of the United States, would be productive of the greatest commercial advantages to its citizens. That some difficulties exist towards realising this object cannot be denied. One is the disturbed state of Central America at the present moment, and the civil commotions to which it is subject at all times. Another would be to obtain a grant of land on each side of the river St. Juan, with the sovereignty of the country ceded, without which a sufficient security would not be afforded to the persons and properties of our citizens who might establish themselves there. But these difficulties are not insurmountable; and even should they prove so, the attempt to remove them would be itself a glory, and the want of success an honourable failure."

On reading this we exclaimed, What has become of the proposal to form an English Company, about which so much was heard about three years ago? Has it, like many other excellent projects, been swamped by indifference, or all its national advantages overborne by the vague notion, that it might resemble some of the bubble companies so rife at the time? If so, it is to be hoped that those who can promote its success will bestow the needful pains on investigating its practicability and prospects, and not lose to Great Britain the mighty benefits that must accrue from its adoption and execution.

We now resume Mr. Montgomery's track, and the first halt we have to make is at Esquipulas, where there is a famous miracle shrine, of which we are told the following story:—

"The curate, an amiable and sensible man, and somewhat of a scholar, was a firm believer in the miracles attributed to the image just described. He seemed anxious to impress me with the same belief, and tried every argument that he thought calculated to remove my incredulity. At length he pressed me so hard, that I was fain to resort to a stratagem in order to escape from the toils he was spreading round me. I declared to him that if the Señor de Esquipulas would work a miracle in my behalf between that day and the next, and enable me to proceed to Guatemala direct and without risk, I would believe him. The reader will be surprised to learn what follows. On getting up the next morning, and as I was leaving my chamber, the first person I met was the curate. He had been lying in wait for me; there was an arch smile on his countenance; he saluted me with the usual *buenos dias*, and expressed himself with the following words, 'Did you not ask for a miracle? and did you not require that it should be a safe and direct conveyance to Guatemala? Well, sir, your conditions have been fulfilled. I have just learned the arrival, in this town, of a convoy of mules, laden with tobacco, which, as soon as a party of soldiers appointed by the government to escort them shall arrive, will proceed to the capital direct. Could you desire a better opportunity? Will you now believe?' I confess that the statement of the curate struck me with surprise. I affected to believe that he was jesting, but he soon compelled me to admit the truth of his assertion. On inquiring, however, into the particulars of the case, I learned that eight days, at least, would elapse before the arrival of the escort; that the rate of travelling of the convoy would never exceed eight or nine miles a-day; that they encamped in the open fields; and that to get to Guatemala in this way would be the business of a

month. This being the case, I told the curate that it would not do, and that the miracle was no miracle after all."

Of a far different character, and deeply disgraceful to any religion, is another relation which we find elsewhere at Taltique, an Indian village, the inhabitants of which are described as being very superstitious—no wonder with such instructors!

"The curate (we are told) was an intelligent man withal, and full of information and anecdote. His illustrations of the Indian character were highly interesting, and his remarks on the propensity of that people to idolatry, both sensible and amusing. With reference to this subject, he related to us the following among other anecdotes. One of his predecessors in the curacy had detected his parishioners in the adoration of a god of their own. This was no other than an old Indian, whom they had dressed up in a particular way, and installed in a hut, where they went to worship him, offering him the fruits of their industry as a tribute, and performing in his presence certain religious rites, according to their ancient practice. His godship, who had no manner of work to do, and was regaled with all the good things that the village afforded, found this a sufficiently pleasant mode of life, and willingly sustained the character he had been made to assume. But such impious proceedings the curate was determined not to suffer. He remonstrated with his flock, and admonished them both in public and in private, but all to no purpose: he was listened to by no one; he threatened, and was threatened in turn. He now adopted another course, and, affecting to approve the conduct of his parishioners, humoured them in the mad whim they had been seized with. It was that time of the year called Passion Week, when certain ceremonies are performed in commemoration of the sufferings of our Saviour on the cross. The curate proposed that the passion and death of Christ should be represented by the Indian deity in person; that he should have a crown of thorns put on his head, and be whipped and crucified. 'After he is dead and buried,' said the curate, 'he, of course, will rise again, and then we will all believe in him.' The Indians were delighted with the idea, and, in their simplicity, determined to proceed according to the suggestions of their pastor. The old Indian was brought forth, and, *noles volens*, was decorated with the thorny crown; he then received an awful flagellation, and, finally, in spite of his entreaties to be exempted from so great and unmerited a distinction, was actually crucified. As soon as the poor Indian was fairly dead, they took him down, and carried him to the village church; where, having laid him out, they watched him, and waited with intense interest for the third day, when he was to return to life. But before that day arrived, the body exhibited such symptoms of dissolution, and began to be so offensive, that the Indians already entertained doubts of the legitimacy of their god. They held out, however, till the expiration of the third, when, finding that there was to be no resurrection, they dragged the body out of the church, and threw it on a dunghill. From that time forward, they submitted with exemplary docility to the directions of their spiritual guide."

From this monstrous anecdote we turn to a natural phenomenon, which, though terrible, has none of the horrors of the human act. Between St. Salvador and Sonsonate—

"A deep rumbling noise was heard, like distant thunder. It was occasioned by the

eruptions of the volcano of Isalco, from which we were only a few miles distant. A little further on, having ascended an eminence, we came in full view of the volcano, and could see the smoke bursting in a thick column from the crater. The scoria and ashes emitted by the eruption fell in a shower round the mountain; and a stream of lava, though not then visible to the eye, could be traced by a line of smoke reaching from the crater to the base of the volcano. We approached within a mile of the base of this burning mountain, where the ground was covered with pumice stones and fragments of solid lava. It was a volcano of recent formation; its commencement dating not more than fifty years back. It broke out from the top of a hill of no great elevation; but the quantity of stones and lava emitted by it since its first eruption have already formed a respectable mountain. The peculiarity of this volcano is, that the eruptions are almost continual; so that if not exhausted by constant performance, it will become in time one of the most remarkable in the country. During one of its fiercest eruptions, a stream of lava so copious was emitted, that it reached within a hundred yards of the village of Isalco, situated about three miles from the base of the volcano, laying waste a large tract of cultivated land, and dooming a fertile soil to perpetual sterility."

A little further on we are reminded of the Geysers of Iceland. At Aguachapa,

"An opportunity was afforded for visiting the volcanic phenomena in the immediate vicinity of the town. A party was accordingly formed, and we proceeded on horseback to a low, barren plain, where we saw the boiling lakes that I have alluded to above, when speaking of the apertures in the ground emitting a dense vapour. Of these lakes, or ponds, there are several; and they occupy a considerable tract of land. The largest is about a hundred yards in circumference. In this, as in all the others, the water, which was extremely turbid, and of a light brown colour, was boiling furiously, and rising in bubbles three or four feet high. The steam ascended in a dense white cloud, and spread for a considerable distance round. As I stood for some time on the bank of this natural caldron, gazing with awe upon its tremendous vortex, the heat was so great on the surface of the ground, near the borders of the lakes, that had our feet not been protected by thick shoes, it could not have been endured. On thrusting a knife into the ground, the blade, when drawn out, after a few seconds, was so hot as to burn the fingers. Our horses, which, according to the custom of the country, were not shod, exhibited such symptoms of uneasiness, owing to the state of the ground beneath them, or in consequence of the strong smell of the steam, that it was found necessary to leave them tied at some distance from the scene. In some places a little column of smoke issued fiercely from a hole in the ground, while in others, the water, in a boiling state, gushed out like a fountain. The ebullitions of these lakes, or springs, have formed, on the borders of them, a deposit of the finest clay, and of every variety of colours. But it does not appear that the natives have profited by the facility thus afforded them for the manufacture of pottery. And although nothing would be more easy than to establish there the finest mineral baths in the world, this object has never occupied their attention."

With an extract, relating to the animals, &c. found in this part of the earth, we shall conclude our selections:—

"The otter and the manati are to be found in the rivers, which also abound with alligators: The latter are sometimes very large and dangerous. Concerning these animals, a curious circumstance was related to me, for the truth of which, however, I cannot vouch. The wound produced by the bite of the alligator very soon fills with worms, and becomes exceedingly difficult to cure. But if when a person is bitten, he immediately washes the wound in the water of the stream frequented by that animal, no worms appear, and a cure is easily effected. Of snakes, lizards, and other reptiles, there is a great variety and abundance. The most dangerous are the rattlesnake, and another species called the tamagazo; but particularly the latter, which is so venomous, that its bite occasions instant death. Happily, there exists an infallible antidote to the venom of these reptiles in a plant called *el guaco*, the leaves or roots of which, pounded and applied to the wound, or used internally by chewing them, and swallowing the juice, very rarely fail to effect a cure. This plant is also worn round the legs or ankles by persons in the woods, to prevent the bite of a snake. It is always to be found near places frequented by venomous animals. Its effect on them is believed to be narcotic and soothing—a sort of intoxication which disarms them of their malignity. I was told by a merchant at Izabal, that having allowed the guaco to grow up in his garden, the place in a short time was infested by snakes; but that on rooting up the plant, and clearing his garden of it, these unwelcome visitors disappeared. It is believed that the guaco might prove an excellent remedy against the cholera, as also in cases of hydrophobia; but it does not appear that the experiment has yet been made. The mica is another snake, the reputed peculiarity of which is that it does not bite, but lashes with its tail, which it uses like a whip. In doing this, the mica fixes its head in the ground, and exerts itself so effectually as to flog an enemy to death. I do not vouch for the truth of this marvellous story. The boa is also found in some parts of Central America. The armadillo and the iguana are common, and are said to be excellent eating. Scorpions and centipedes are also numerous, and the more troublesome, as they infest the dwellings of the inhabitants. The birds of Central America are deservedly celebrated for their great variety, and the extraordinary beauty of their plumage. Among the most conspicuous, is the quessal, or *Trogon resplendens*, which is to be found only in the wild and remote regions of Central America and the south of Mexico. Those frequenting the forests of Quetzaltenango, from which they derive their name, are much the finest. This bird is of the shape and size of a pigeon. Its plumage is of a metallic golden green, except that of the wings, which is spotted with a brilliant red and black. The head is adorned with a soft silky crest of short barred feathers, of a beautiful green. But the distinguishing feature of this bird, and that which constitutes its peculiarity and beauty, is the plumage of its tail, which consists of three or four loose wavy feathers of a rich green, powdered with gold. These feathers are barred, and about three feet long. They used to be worn by the aborigines of America as ornaments for the head. In brilliancy of plumage, and in symmetry of form, this bird—even setting aside the grace and beauty of its pendent plumage—is unrivalled among the feather tribe. When deprived of the ornament of its tail, the quessal seems sensible of the injury: it sickens and dies. Such is the importance it

attaches to this part of its gorgeous dress, that the nest it makes is provided with two apertures, one for egress, the other for regress, in order to avoid the necessity of turning, by which the feathers of its tail might be broken or disordered. For the same reason it seldom makes a short or sudden turn. The Indians held it sacred, and used to say that the Creator, when he formed the world, assumed the form of a quessal."

How the *guaco* can be an infallible cure for the bite of a serpent which "occasions instant death," our author does not say: the latter is only a mode of expression, we must suppose, for "very quickly." We have only to add, that great hospitality is a striking merit of the people; that great diversity of hill and dale, and rivers, and other picturesque features, mark the external face of the country; and that Mr. Montgomery's expedition occupied him about a month from New York to Izabal, twenty-eight days from Izabal to Guatemala, and in all five months between his departure and return to Washington.

*Works of Sir E. L. Bulwer, Bart.: Rienzi.* 12mo. pp. 544. London, 1840. Saunders and Otley.

It is with great pleasure we see commenced an edition of the works of Sir Edward Bulwer; and our gratification is increased by the circumstance of their adopting a succinct form, being at once extremely neat and extremely cheap. Popular as they have deservedly been, both at home and abroad, they will thus obtain a wider circulation in their native land, and we shall no longer suffer the reproach of knowing that in America, and all over the continent of Europe, a writer of his distinguished genius is more universally read and more highly prized than in the country adorned by his talents. In France, Germany, and the United States, it is true, there is no envy to carp at these eloquent productions, no party feelings to mark their author as an object for the shafts of satire and malignity. There he has fair play; and there admiration keeps pace with his deserts. The value of his works is appreciated, and all those fine delineations of humanity,—the unravelling of the mysteries of our natures, the powerful and pathetic descriptions of life, in its tangles of distress and misery,—the philosophy of man and the complication of events,—all the splendid and interesting qualities with which Bulwer has enriched the world of imagination and fiction—teaching truth—are estimated at their real worth, and he takes his rank with the foremost and most honoured names in the literature of our age.

Such, too, is his destiny here; and when the clouds of the present shall have been dispersed by time, we shall find these volumes in every hand, the favourites of a delighted people. It is for these reasons that we so entirely approve of their issue in this shape; for the more they are read the higher will the reputation of their author rise, and the sooner will full justice be done to his noble efforts.

Of *Rienzi* we need not repeat our praise. A frontispiece by Maclise, and a vignette by Creswick, are worthy of the tale; and the whole a bright and welcome appearance in English letters.

*A Memoir of the Political Life of the Right Hon. Edmund Burke; with Extracts from his Writings.* By George Croly, LL.D. 2 vols. 8vo. 1840. Edinburgh, Blackwoods; London, Cadell.

MEANT, under "the circumstances of the

anxious period in which we live," to form an anti-revolutionary MANUAL of the wisdom of the wisest of men, these memoirs originally appeared periodically in that sturdy anti-revolutionary magazine which flourishes under the crutch of Old Ebony. There so general a circulation was secured, that any extracts in our page would only be dull repetition to be skipped by our readers; and, as we have no wish to occupy it in such a manner, even by the eloquent writing of Dr. Croly, we shall dismiss the publication with a few lines, by way of example, from his preface:—

"The rank of Burke, as a writer of consummate eloquence, had been decided from the beginning of his career; the progress of the Revolution placed him in equal eminence as a statesman; and every year since has added to his renown as a prophet. While the works of this admirable mind are left to us, the country is in possession of a storehouse of political wisdom, from which she cannot supply herself too largely, or too often; she has a great Oracle, to whose responses she cannot trust with a too-solemn reliance; for the peculiar and pre-eminent character of Burke's genius was its love of reality. With the most palpable powers for reaching the loftiest heights of speculation, he is the least abstract of all speculators. With the poetic fancy which so strongly tempts its possessor to spurn the ground,

'Among the colours of the rainbow live,  
And play in the plighted clouds.'

and with an opulence of language that, like the tissues thrown on the road of an Oriental prince, covered the wild and the thorny before him with richness and beauty, he never suffers himself to forget the value of things. The application of reason to the purposes of life; the study of the sources of moral strength; the inquiry into that true 'wealth of nations,' which makes men safer from the shocks of society, are his perpetual object. He pours his river through the moral landscape, not to astonish by its rapidity and volume, or delight by its picturesque windings, but to carry fertility on its surface, and gold in its sands.

What was once reform is now revolution; monarchy, once admitted by all parties to be the natural government of the state, is now pronounced a prejudice, and the popular aspiration is democracy. And this new terror is no dream of the study; no thin shape of mysticism floating before the eyes of visionaries; Ribandism and Chartism are its substantial forms. However widely differing in their origin, their determination is the same. Travelling by different routes, they march to the same point; and whether hatred of the church leads them to subvert the throne, or hatred of the throne to subvert the church, neither will have achieved its object, until both meet on the ruins of the constitution. That the property and intelligence of the empire, when once roused, will resist courageously, and if roused early enough will resist triumphantly, is beyond question. But it will be too late, when the twin conspiracies shall have become one, and when the people of England shall see some new and monstrous shape of government demanding their submission; some huge, crude, and presumptuous Babel of society, at once threatening earth, and insulting Heaven; some new 'city and tower' of infidel building; where the democratic principle, known only by its evil attributes,—like an Indian idol, with its hundred hands grasping only swords and serpents,—shall sit to be worshipped with the horrid and sanguinary rites of superstition, or

the still more horrid impurities of popular passion, let loose to riot without fear of God or man."

We shall not nowadays attempt an eulogy on Burke, but we may truly say that the study of his writings as models of style,—of the sublime and beautiful, of force, energy, grace, pathos, and genius, must always be of the utmost advantage to those who desire to cultivate the finest expression of logical pith and fitness of embellishment.

#### LLOYD'S JOURNEY FROM CAUNPOOR.

[Second notice : conclusion.]

THE extracts selected in our last will serve to shew the character of this narrative; and we gave so much of them, that we can only refer to J. G. Gerard's letter, so replete with information respecting the Himalaya regions. Captain Alexander Gerard's narrative occupies the second volume, and, both on scientific and general grounds, is of deep interest. We have not space, however, for more than a few insulated paragraphs. He says:—

"I have preserved specimens of the whins, broom, and other Tartaric productions; and some of the sacred sentences of the Lamas engraved on stone, which I know you will be anxious to see. In a field of such variety it is difficult to fix the attention long upon any one object; but, perhaps, after all, a little knowledge of every thing is more desirable than a disquisition upon a few subjects only."

Leaving the village of Meerou, we descended by a very rocky road one mile to the bed of the Yoola, a considerable stream rising in the snow, and falling into the Sutluj. The point at which it is crossed is 1200 feet perpendicularly under the village. Along the banks are many fertile fields. Further up are several shurns or dogrees, inhabited by shepherds and their flocks, for half the year. The people live in huts, and are regularly relieved from the villages; and during their residence in these delightful spots, their only occupation is making ghee and tending the flocks. The general elevation of these cottages is from 10,000 to 12,000 feet, and many of them are very romantic. One may conceive the beauty of a sequestered glen presenting a carpet of the sweetest smelling flowers intermixed with many varieties of thyme and other aromatic shrubs, shut in by huge cliffs on either side, some of them of bare granite, frowning in awful magnificence over the peaceful herds, and threatening them with destruction; others crowned with everlasting snow, rising in the wildest forms which the most fantastic imagination could conceive. Lower down are belts of evergreen pine, interspersed with the dark-coloured shade of the oak and holly; and above all is seen the yellow birch, and rhododendron, with its delicate pink flowers. These are the last trees we meet with in approaching the snow. The climate of these situations is pleasant in summer, and the productions are those of our high latitudes. The strawberry, raspberry, and black currant, grow there in perfection, upon the verdant banks of the transparent streams of liquid snow. From the Yoola, the road ascends through a wood of oak and holly, which gives cover to several species of pheasants of the most gaudy plumage. We passed a small village named Oornee, and travelled over rough masses of gneiss leaning over us, and along the edge of frightful precipices, with scarcely a tree to weaken the effect. To-day I saw several places where the ground was torn up by bears, in search of the honey of the field-bee, which is common at this height and situa-

tion. The hive-bee, such as we find in Europe, is also a native of this part of the interior; but they are less numerous than in the tracts bordering on the plains: they are lodged in apertures in the walls of the houses, and the honey is procured without destroying the bees, as they are smoked out with burnt straw; a far more rational operation than the barbarous method in use amongst more civilised people. About half the honey only is generally taken away; consequently, the bees return to the rest. In elevated villages the honey is collected once a-year, but in milder climates both in spring and autumn: the latter season produces the finest quality. Tholaug contains fifty-five families, and is 7300 feet above the sea. It is agreeably situated on both sides of a rivulet, and has seven divisions,—Yashung, Darmaling, Rangmee, Sgeentong, Hoorkaping, Chainee, and Yongpaling. There are several Deotas here. They are to be found in every village of Koonawur. The temples are well built; generally higher than any of the houses, and are visible from a distance. Many different kinds of deer, including the musk, frequent these places, and they are killed and eaten, and the horns nailed in pairs on the outside of the temples. The other wild beasts are leopards, panthers, and a small animal of the size of a dog, called 'changkoo' and 'manga.' The latter go in flocks, and carry off cattle, but never attack men. Hawks are caught in Toopka, and are sold at Rampoor at sixty and one hundred rupees each. The rajah of Busahir resided there during the period when the Gorkhas had possession of the country. Opposite to this is the village of Zhane, near which was decided the last battle between the Koonawurees and Gorkhas. The advanced guard of the latter, which was only engaged, was partially defeated, and the Koonawurees then retreated across the Sutluj. When peace was concluded, the Gorkhas retired to Sooran, and never afterwards entered Koonawur, but received the tribute which was regularly paid.

Four miles from Rampoor we crossed the Nouguree, a large stream coming from the eastward, and uniting with the Sutluj a few yards below the road. The wooden bridge is one of the best of the kind I have met with; but, being high above the stream, which darts forth with great velocity, it is not traversed without uneasiness to inexperienced passengers; hence four miles and three quarters by a similar sort of road to Dutnugur. Hitherto the dell of the Sutluj is very narrow, the mountains forming it rising abruptly, so that the road is made with difficulty and some danger, and it is in no part a stone-cast from the river, neither villages nor cultivation occurring till near Dutnugur, where the dell expands and forms a flat of two miles in length, well watered by canals, and bearing luxuriant crops of rice. Dutnugur is a large village, named after a Deota who resides in it. There are fifty families, half of them Brahmins, who have rent-free lands. It belongs to Kunchen, a small district of Busahir, formerly under a chieftain who lived in the Fort of Sangree, now dismantled. Nearly opposite to this, across the Sutluj, upon the bank of a considerable stream, which formed the ancient boundary of Busahir, is the large town of Neermund, containing 400 families, Brahmins, and a famous temple, named Umbka, for whose and the Brahmins' support a great many rent-free lands are assigned. Three and a half miles further, by a level road on the edge of the Sutluj, I crossed the Muchad stream by a sango, which brought me to Nirtnugur, where I halted three hours. This is a small rent-free Brahmins'

village, close by the Sutluj, in the Thakooras of Delut, which is under a chief who pays tribute to Busahir. Here, as well as at Dutnugur, there is sometimes a mela, or fair, where a person slides down a rope. At this place the rope is suspended above the Sutluj, the banks being of so very unequal a level as to produce a necessary inclination; and the last time this occurred (many years ago) the rope broke in stretching, which is considered a very unlucky omen; and the Brahmins are regarded as outcasts until the ceremony is successfully performed. This is a feat of agility which is frequent hereabouts, and I shall add an account of one which happened last year (1820) at the village of Dulas, in Kooloo, which I visited. It is proper to premise that there are eighteen Deotas in this vicinity, where the ceremony takes place; ten in Kooloo, two in Sooked, a neighbouring rajship, and six in Busahir. The most revered of these is Umbka, in Neermund, the large town before mentioned. Here it occurs every twelfth year, in the middle of August of the same year in which the grand Hurdwar fair takes place. At the other temples it is less common, being once in twenty or thirty years. The whole of the eighteen Deotas assemble, when the man slides down the rope, and before the grand mela, which is called Bhoonda, there is a ceremony named Hoom, which is as follows:—Two pits of masonry, about twelve feet deep, are opened; one is filled with water for the ablutions of the Brahmins, and in the other a constant fire is kept up, into which a certain proportion of dates, sugar, rice, raisins, newsas, ghee, oil, and sandal-wood, is daily thrown for a certain period; the duration of the Hoom varies according to the grandeur and revenue of the Deota. At Neermund it is said to be two and a half years, and at Dulas six months. It concludes immediately before the mela begins, and the pits are then shut up by boards, the most superstitious people believing that the fire continues burning until the next Bhoonda. A considerable expense is incurred at the fair, besides what is required for the Hoom, as most of the people who assemble to see it are fed during the time it lasts, which is usually three days. The most respectable persons get a sheep, or goat, some salt, rice, and ghee; and the poorer class are supplied with grain. At Neermund, the concourse of people is from 12,000 to 15,000; and at the other Deotas, from 5000 to 6000. As soon as one Bhoonda is concluded, they begin to collect grain for the next, consequently, little of it is eatable. I and a friend were at Kotgurh in August, and asked permission to visit Neermund, which was not granted; but the Wuzer said he would be happy to see us at Dulas, and we accordingly proceeded, crossing the Sutluj by a rope bridge. We reached the village on the 23d of August, and on the 24th most of the Deotas arrived, only one or two of them in person, however, the others being represented by clothes, pots, plates, or books, which were sent instead of the image; and each was carried on the head of a Brahmin, and encircled by silk cloths and shawls, and around them were people waving chouries and fans of peacocks' feathers. They were preceded by dancing girls and the music of drums, trumpets, cymbals, and pipes; some of the Deotas had neatly painted large chattas (umbrellas), which were kept twirling round, whilst others were accompanied by red triangular cloth flags. The Neermund Deota had a very large silver trumpet, and was attended by many people, including the Wuzer, who carried silver maces. All the Deotas and their utensils,

&c., were placed close to each other in a small space cleared of grass, where there was a fire burning, and at 5 P.M. they were taken to a temple in a village. August 25.—Nothing particular occurred, but men and women were singing, dancing, and playing upon many kinds of musical instruments. August 26.—This was the grand day, and crowds of people began to assemble at an early hour, to secure a favourable spot for viewing the ceremony. There were about 4000 spectators, including men, women, and children, all of them clothed in their best attire. Many of the men wore silk clothes, and the usual head-dress, which is a cap of black blanket with a red crown. The women were covered with ornaments from head to foot, such as beads, cowrie-shells, and necklaces. Many wore shawls, and striped silk tartan, and a few had even massy gold earrings and bracelets. At 9 A.M. the rope, which was upwards of 1800 feet long, was brought to the place by a great many people, who formed a long line, each carrying a large coil over his shoulder. The rope was threefold, and three inches in diameter. It was made of a fine kind of grass called *moonja* (the same is used for the bridges), by the person who slides down it, which occupies him a year to finish: six months are spent in collecting the grass, and six in plaiting it. The rope was fastened to two posts, one on the side of an abrupt mountain, and the other a considerable distance from its base: little more than half of it was used, the distance between the points of suspension being 654 feet measured. It was pulled as tight as possible; but in such a space you may easily suppose it was very much curved. The elevation of the upper post from the lower one was  $22\frac{1}{2}^{\circ}$ , but the first part of the declivity was  $35\frac{1}{2}^{\circ}$ , gradually lessening; and the hundred feet nearest the ground was almost parallel with the horizon. The last stretch given to the rope was by raising the lower end some distance from the post by cross sticks, to about twenty feet from the ground. At noon, the lad who was to slide down was borne upon men's shoulders from the village to the upper post. He waved a white cloth round his head all the time they carried him. He was then placed in a seat formed out of half a hollow fir-tree, with a support for his back, and sand-bags of 20 lbs. tied to each of his feet; he was upon the whole so well secured as to be in little risk of falling if the rope did not break, which I believe very seldom happens. During the time of adjusting the sand-bags the seat was tied with a string to the upper post; and at three P.M., when all was ready, on a signal given by the Brahmins, a couple of matchlocks were fired, and two goats slain by striking off their heads at a single blow of a hatchet; the seat was let loose by cutting the string, and the man descended at first with extreme velocity, gradually abating till he stopped within 120 feet of the lowest post. During the descent he continued waving the cloth round his head. When he halted the rope was lowered, and he was taken off and conducted to the village amidst the shouts and cheers of a crowd of spectators. He was handsomely remunerated for the performance; he received eighty-four rupees, together with gold earrings and silver bracelets, from the Brahmins of the temple; a rich dress and some money from the Wuzer; ten rupees from each of us; and from one to three rupees from several of the chief people, beside some annas from many of the poorer sort. Had the rope broken he would, in all probability, have been killed on the spot; but should he survive, he is not put to death, as is the

custom in Gurhwal, mentioned by Captain Raper. After the ceremony the rope is coiled round the temple."

**Capt. A. Gerard.**—It will have been seen by our last number, that Capt. Alex. Gerard died a few months since; and as the editor observed that he could not then enter into any biographical accounts of this celebrated traveller, from whose journal we have quoted these remarks, and as any notice of him will prove acceptable to our readers, we now give a few particulars with which we have been favoured by a relative. Capt. Alex. Gerard was a son of the late Dr. Gilbert Gerard, well known as the author of the "Institutes of Biblical Criticism," and grandson of Dr. Alex. Gerard, whose work, "The Essay on Taste," gained a prize from the Edinburgh Society for the Encouragement of Science, and is a standard work on that subject. He entered the Company's service at the early age of sixteen; and as his talents and disposition particularly fitted him for surveying, he was employed in that capacity. For many years he prosecuted his researches with unwearied labour and unrivalled skill, exposed to the influence of a burning sun whilst making observations in Malwa under Sir D. Ochterlony, and the inconceivable hardships and vicissitudes of the Himalayan and Tartaric countries. In this latter portion of his travels, he was accompanied for some time by his devoted brother, the late Dr. James Gerard, who died from the sufferings he had undergone in the journey to Bokhara with Col. Sir Alex. Burnes. Both brothers were eminent as scientific men; and we sincerely trust that their enterprise may now at last meet with that fame which the editor has so much at heart. We are informed that they have left numerous MSS. containing the most valuable information, and we hope that the editor will lay it before the public ere long.

**Illustrations of the Breeds of the Domestic Animals of the British Islands: consisting of a Series of Coloured Lithographic Prints of the Horse, the Ox, the Sheep, the Goat, the Hog.** From Oil Paintings by Mr. Shiels, Edinburgh, and Drawings by Mr. Nicholson, R.S.A. Descriptive Memoirs, by David Law, Esq. F.R.S.E. Professor of Agriculture in the University of Edinburgh, &c. &c. London, 1840. Longman and Co.

THIS is truly a magnificent work, designed, as the prospectus informs us, "to illustrate the distinctive characters of all the most important races or breeds of the domestic animals proper to, or naturalised in, Great Britain, and to consist of a series of portraits of animals characteristic of the different races."

We are further informed that, "in the year 1832 a grant, by authority of government, was made from the funds of the Board of Trustees of Scotland, for forming an Agricultural Museum in the University of Edinburgh. Among the objects which this institution embraced was a collection of paintings, illustrative of the British breeds of the domestic animals. This branch of the museum has now become very extensive, embracing all the more essential native breeds, as well as some of foreign countries. It is from this fine collection that the materials for the present work are derived. It is intended to make such a selection from the originals as will fulfil the purposes of illustration, without extending this work beyond the limits which it will be proper to assign to it. The paintings are all portraits of animals selected from the stocks of eminent breeders, wherever

the best examples presented themselves in any part of the kingdom. They have been executed by a distinguished artist, Mr. Shiels, of the Royal Scotch Academy, whose time has been devoted for upwards of seven years to the subject, and who is still engaged in completing the series of the native breeds. The paintings have been made with the utmost regard to fidelity of representation, so that all the essential characters of external form may be shewn."

And truly it may be stated of this First Part, that nothing of the kind, so accurate and beautiful, so useful to the agriculturist, and so excellent for the artist, has ever been given to the public. The engravings are four in number, and represent—

1. The Wild or White Forest Breed: a cow, eight years old, from Haverfordwest, in the County of Pembroke.

2. The Pembroke Breed: a bull, three years old, bred by Robert Innes Ackland, Esq. of Boulston; and a cow, five years old, bred by Mr. Innes Ackland.

3. The West Highland Breed: a bull, four years old, bred by Colonel M'Neill, of Barra, by a bull bred by Mr. Stewart, Chesthill; and a heifer, bred by Alexander Campbell, Esq. of Caolis, by a bull bred by Mr. Campbell.

4. The West Highland Breed: a West Highland Cow, bred by Mr. Maxwell, of Aross, Mull, by a dun bull bred by Mr. Maxwell; and a young bull, eighteen months old, bred by Mr. Campbell, of Caolis, by a black bull bred by Mr. Campbell.

As we have observed, these prints are most natural and correct likenesses, done in so artist-like a manner as to be admirable pictures. When we add that the letterpress is full of practical information, we have only said what the work deserves, and so recommend it to the attention of the important class of the community whose interests are so intimately bound up in the subject of improvement in the breeds of domestic animals.

#### MISCELLANEOUS.

*Scenes from the Life of Nickleby Married.* Nos. I. and II. (London, J. Williams.)—A pseudo sequel to *Boz's* popular work in sixpenny weekly numbers. We do not remember a single production of this sort which was ever successful. Men of talent will always prefer taking up, and working out ideas of their own; and, even if a writer as clever as the original would adopt the plan of another, he would find it impossible to follow in his footsteps with any degree of credit. These numbers re-introduce the Nickleby family, Squeers, &c. &c., but their spirit is gone, their characteristics have evaporated. The story is without offence, but it is, as yet (and we fear must continue to be), equally destitute of amusement or interest. We have also to remark, with much disapprobation, upon the servile imitation of Mr. Dickens's title, wrappers, and other adjuncts. We do not imagine that imposition on the unwary public is contemplated, but if it were so, nothing could be better calculated for that effect.

*On Diseases of the Bladder and Prostate Gland,* by W. Coulson. 8vo. Second edition. (London, Longman and Co.)—We are glad to remark that this valuable treatise has so soon reached a second edition. The additions made render it still more worthy of attention, where the painful disorders alluded to afflict humanity.

*Prince Albert's Ancestry, &c.,* by the Rev. Edward Taubenschmidt. Pp. 107. (London, Black and Armstrong; Mitchell.)—Another of the genealogical accounts of the family now so nearly allied to our throne, and tracing the lineal descent of the young prince on whom so much of hope and expectation is founded, from the period of Earl Theodorick, or Dideric, of the house of Bucizi, who died A.D. 982.

*The Spirit of the Church of Rome, &c.,* by T. Stephen, author of "The Life and Times of Archdeacon Sharp," &c. Pp. 332. (London, Hastings.)—In the lamentable religious struggles of our day, a frontispiece to this volume, representing tortures inflicted by the Spanish Inquisition, indicates it to be a bitter Protestant assault upon the Romish church. Such it is, and full of atrocities charged upon that church. Heaven knows how many cruelties have been committed in the name of the religion of love and peace!

#### ORIGINAL CORRESPONDENCE.

##### (CON)TEMPORARY LITERATURE.

To the Editor of the Literary Gazette.

MR. EDITOR,—I consider the situation you hold in the literary world makes you especially bound to protect its understanding; but as that has been so cruelly invaded by certain periodical writings which now form the style of

the day, and whose names I leave to be guessed at by their overwhelming popularity, I trust a few passing remarks (in aid) will find admission into your valuable journal. Now I assert, that, with all their pretensions to that sterling quality—wit, they have not one single ingredient of its composition; but that they merely consist in practical jokes and lengthened descriptions, brought about by such a formidable array of words, that the minutest substantive is not left to make its own impression, without being qualified by an adjective of the most extraordinary dimensions: so that it is only in the event of its being the author's design to make people laugh, that he can be said to have accomplished his end. Were it to rest here, it might be well; but so many works have been inoculated with the same character, as to leave nothing remarkable except their being like one another. Why they have so taken with the public, may be for the same reason that the counterfeit is mistaken for the coin; and if it has passed more currently, it is because there has not been the same provision made against that kind of delinquency. Hence it is that grimace is taken for humour, technicality for smartness, incongruity for quaintness, and extravagance for burlesque. The question arising out of this is, What is true wit? and the most direct answer must be, Just the reverse of all this. It can have no existence unless based upon truth: like quicksilver, it is as remarkable for subtlety as brilliancy; and what pantomime is to comedy, so is this spurious stuff to true wit: the former may convulse with laughter, but the latter surprises and delights; by the one we are carried away by inconsistency, whereas by the other the inconsistency is charged home upon ourselves. And it is quite as just to suppose, that if what excites riability the most, in the same degree departs from true wit; so the effect of true wit upon the mind must be chaste in proportion to the quality which produces it. As to judging of the merits of works according to their sale, this will apply as much to patent medicines as puffed books: we have had quack authors as well as quack doctors in all times, who have only differed from their legitimate brethren by the length of their day or the strength of their pay. Tom and Jerry, the only *ci-devant* concern with which this style may be compared, is looked upon now as the very same trick upon the town as its successors assuredly will be a little time hence. But why not "be wise betimes," and not, by plucking laurels from the brow of Sense, place them only on the front of Impudence? Cervantes suffered by this kind of contact, when his hero was superseded by a wretched pantaloon bearing the name of Quixote; and Addison found his Sir Roger in such base and cruel hands, that he was obliged to kill him out of his misery. Numerous examples of this kind might be produced, but as to a man of genius now coming into competition with any of the mass, it would be as difficult to search him out as to find a needle in a bottle of hay. I am aware that those who have but few ideas do well to make the most of them, therefore I pity the necessitous in any form, and would commend the thrift of such as supply the deficiencies of *se* by words; and only wish it were so *eu*, that what they write none but *as* should read: but it is most lamentable when the strength of an author's pretensions shall be in his weakness, and the disorders of his intellect (so far from being perceived) shall create a serious call for the infirmities of his mind. To pass by the voluminous, we need only remark upon the vegetating

journalising of the day, when their best appeal to the public is made through the medium of extra sheets, which, in substance, would not contain half the matter of your own. I do trust, sir, you will sympathise with my anxiety to restore what has been so long drooping, as I think nothing should be withheld that might tend in any measure to give a right direction to the public choice. Respectfully yours,

T. W.

Kensington, February 7th, 1840.

#### ARTS AND SCIENCES. THE NIGER EXPEDITION.

FROM papers laid before the House of Commons we receive much information relative to this Expedition. Lord John Russell, after animadverting on the evils of the slave-trade, and the impossibility of checking it under the present state of circumstances, impresses the necessity of a new preventive system to arrest it in its source, by counteracting the principle on which it is now sustained. "With this view," his lordship adds, "it is proposed to establish new commercial relations with those African chiefs, or powers, within whose dominions the internal slave-trade of Africa is carried on, and the external slave-trade supplied with its victims. To this end the queen has directed her ministers to negotiate conventions, or agreements, with those chiefs and powers, the basis of which conventions would be, first, the abandonment and absolute prohibition of the slave-trade; and, secondly, the admission for consumption in this country, on favourable terms, of goods, the produce or manufacture of the territories subject to them. Of those chiefs, the most considerable rule over the countries adjacent to the Niger and its great tributary streams. It is therefore proposed to despatch an expedition which would ascend that river by steam-boats, as far as the points at which it receives the confluence of some of the principal rivers falling into it from the eastward. At these, or at any other stations which may be found more favourable for the promotion of a legitimate commerce, it is proposed to establish British factories, in the hope that the natives may be taught that there are methods of employing the population more profitable to those to whom they are subject, than that of converting them into slaves, and selling them for exportation to the slave-traders. It will be necessary to build three iron steam-vessels for this service, and the first cost of those vessels, including provisions and stores for six months, will amount to 35,000*l.*; the annual charge of paying and victualling the officers and men will be 10,546*l.*; and the salaries of the conductors of the expedition, and of their chaplain and surgeon, will probably amount to 4000*l.* In addition to this expenditure, presents must be purchased for the chiefs; and tents, mathematical instruments, with some other articles of a similar kind, be provided."

Sir Edward Parry reports, that "the vessels should be built very strongly of iron, expressly for this service, the two larger to have very roomy and airy accommodations for their officers and crews, and to be of exactly the same size, rig, and power, with all their stores precisely alike. The third vessel, intended for detached service up smaller rivers, for conveying intelligence or sick persons, and especially for sounding ahead of the other vessels in difficult or unknown navigation, should also have her stores of every kind as much like those of the other two, as possible. The steam-engines of the three vessels, that is, two in each of the larger and one in the other, should be of the

same power, constructed by the same manufacturer, and precisely alike in the most minute particular, so that the duplicate (or spare) parts may fit any of the engines without selection or alteration. After consulting with Captain Trotter, and other competent persons, I am of opinion that the vessels should be of about the following dimensions:—

"The Two Larger."		
Length on deck .. ..	136 feet.	
Breadth of beam .. ..	37 "	
Depth of hold .. ..	10 "	
Tonnage, about .. ..	440 tons.	
Draught of water not to exceed ..	4 feet 9 inches.	
Two sliding keels .. ..	6 feet deep.	

"Each of the larger vessels to have two engines of 35-horse power each engine, that is, an aggregate power of 70 horses; to carry coals for 15 days (of twelve hours), and to be fitted with projections over the gunwale on each side, like the vessels on the American rivers, for the convenience of stowing a supply of wood for fuel.

"The Smaller Vessel."		
Length on deck .. ..	110 feet.	
Breadth of beam .. ..	22 "	
Depth of hold .. ..	8 "	6 inches.
Draught of water not to exceed ..	3 "	

"To carry one engine of 35-horse power, and coal for 10 days (of 12 hours)."

The expedition is expected to be ready to sail about the middle of October.

#### LINNEAN SOCIETY.

THE Bishop of Norwich in the chair.—There were read, 'Description of a Remarkable New Fern, which has lately produced Fructification in the Botanic Garden at Birmingham,' by Frederick Westcott, Esq. Secretary of the Birmingham Horticultural Society. The plant has been cultivated for some time in the gardens as the Barometz, or Scythian vegetable Lamb; but there is every reason to believe that the present plant is a native of South America. The other paper was 'On a New Arrangement of the Genera of Ferns,' by Mr. John Smith, Assoc. L. S., and Foreman of Her Majesty's Botanic Gardens at Kew. Mr. Smith adopts as the foundation of his arrangement the principles laid down in Professor Presl's *Tentamen Pteridographia*, published at Prague, in 1836, in which the distribution of the veins in the leaves, or fronds, are justly regarded as affording important generic distinctions. The first part of Mr. Smith's paper comprises the group of *Polypodiaceae*. The whole of the genera are characterised, and an enumeration of the species is given. There was also read a note by P. J. Quekett, Esq., on a concrete volatile oil, obtained from the cedar-wood, which solidifies at the ordinary temperature of the atmosphere, and is deposited in minute crystals, possessing a highly aromatic odour. This substance renders cedar-wood highly objectionable in the formation of entomological cabinets, from its becoming abundantly deposited on the contents, and with great difficulty removed. The substance is closely allied to camphor. The wood of the common juniper appears likewise to contain it. Mr. Townshend Fox exhibited a singular spiny lizard, from Texas, the *Phrynosoma cornutum* of authors. Mr. Bunbury presented an extensive collection of specimens of plants formed by himself in Southern Africa, during the year 1838. A number of specimens of new plants were also presented from the Birmingham Botanic Gardens.

#### STATISTICAL SOCIETY.

MR. HEYWOOD in the chair.—A paper 'On the System and Extent of Pauper Relief in Scotland,' by Mr. Deverell, was read. The

facts exhibited in this paper were derived principally from the returns presented in the report made to parliament in 1839, by a committee of the General Assembly of the Church of Scotland, appointed to obtain information respecting the maintenance of the poor in that part of the kingdom; and from the numerical statements contained in a recent publication upon the same subject, by Dr. Alison, of Edinburgh. To these sources we refer, merely observing, that it is a characteristic distinction of the Scottish system of provision for the poor, that it rarely relies on voluntary contributions from the public, and avoids all compulsory assessment as long as there exists any reasonable hope of procuring the needful relief without recourse to that expedient. A paper 'On the Popular Penny Literature of the Day,' by Mr. Weld, was also read. We leave "penny literature" to those who admire it. Some discussion took place on the subject of Mr. Deverell's paper; the majority of the speakers were in favour of a legalised mode of providing for the parish poor,—if not altogether English in its character, something approximating to that.

#### CATLIN'S AMERICAN LECTURES.

WE proceed to give our readers a faithful, but slight outline of the evening lectures delivered by Mr. Catlin last week at the Egyptian Hall; premising, however, that all visitors will find the lectures themselves of far greater interest than any report, since not only are the pictures in the Gallery selected from, and illustrated by, the simple and unstudied narrative of the artist, but various portions of dress, male and female, implements of war and domestic economy, ornamental trinkets and martial decorations, are exhibited: first, severally and in detail; afterwards, as they are actually worn, and by living subjects, dressed up under the lecturer's direction for the express purpose. A mode of illustration that almost transports the spectator for a time into the real scene, and leaves at any rate a stronger and more distinct and lasting impression, than mere reading or pictorial illustration can produce.

Mr. Catlin excuses the polygamy of the Indian tribes on the patriarchal principle—that the wives are really domestic servants, and, as in the East, confined chiefly to the rich. Visitors and ambassadors are received by the chiefs, and for the indispensable duties of hospitality, numerous attendants are wanted: these it is impossible to hire, even among the poorest of the tribes. The labours of the women are also the source of riches to their husbands, as the dressing of skins, &c., enables him to purchase luxuries from the whites, and to furnish his wigwam more sumptuously. War, also, by destroying the males, increases the proportion of the female population; and further, by a natural love of distinction, many women are anxious to become even the fourth or fifth wife of a chief or distinguished man of the tribe. The son of one chief married four wives in one day, purchasing each from her parent at the price of two horses. The Indian runners are more fleet of foot than the horses. One man, whose portrait was exhibited, went fifty miles, and brought back an answer in twenty-four hours. He was ill-made and awkward, except when in motion; and the lower portion of his frame was singularly large and massive in proportion to the upper. A peculiar ornament is worn by many of the Braves, i.e. the most distinguished as warriors, though not necessarily the chiefs.

It is formed of the bones and plumes of the raven, and is worn horizontally on the back, and belted round the waist. The loss of one of the projecting bones in battle is a serious disgrace, as it is presumed the wearer must have turned his back on the enemy. This ornament is also supposed to balance and steady the body when at full speed. The small bows are most prized by the Indians, who seldom or never use the formality of archery common in the west: they but half draw the bow, and this close at the side of the buffalo, &c.; and the singular force of the arrow actually at times pierces through the body of the beast, and passes out entirely. The Indian watches his arrow's flight when shooting to a distance, and believes that he guides it with his eye. This is a common feeling in Tartary also, and may perhaps illustrate the gaze of the Belvidere Apollo. The quills of the eagle are rare, and form a showy head-dress, resembling the crests of Greek and Roman warriors. This head-dress is worn by the Braves, and often extends from the crown down the back, and to the feet. Among the Crow Indians, the hair of the head is frequently six feet in length, reaching down to, and trailing along, the ground. Of this the chief and men are extremely proud; but they clip the women's hair short. Horns also are worn by the Braves. Moccasins are made of the skin of the mountain sheep, which is preferred to that of the deer, and dresses are formed of it, of singular delicacy, and patterns are worked upon it; as, for instance, the circular mamme, radiating in harlequin colours, as brilliant as they are carefully and beautifully inlaid and wrought. As the Indians have no other record of renown—no books nor newspapers—their battle-deeds are worked on their robes; and scalps are, according to the lecturer, the sole trophies of their exploits. We think the former position destroys the latter. The children's cradles are upright; and as the infants are contained in them till the age of a year and a half, they greatly assist the development of perfection of form. The toy attached to them, by its jingling, accustoms the Indian throughout life to love this rude species of music. The theory is certainly pretty, and perhaps true; for the sages or medicine-men load their dresses with this sort of instrumental music, which produces a peculiar and not unpleasing effect. Every thing that is rare and out of the way, and even distorted, is a medicine or mystery, and is worn by the great functionary and physician of the tribe. A most amusing illustration was afforded of this; for Mr. Catlin, as a portrait-painter, was thought capable of making the eyes and lips in his pictures to move, and became at once a medicine-man, an established brother of the craft. The Indians, like the Tatars, until the introduction of glazed and metal pots and pans amongst them, boiled meat by digging a hole in the earth, and inserting a skin to hold the water, the fire being outside. The process was necessarily slow and tedious, nor is it easily comprehensible. We have thus given a very brief outline of a portion of one of Mr. Catlin's lectures, and our report is far from selecting the most interesting parts. Innumerable illustrations of antiquity start up as he proceeds in his discourse; and the novelty and interest of the subject was distinctly evinced by the repeated applause of a delighted audience, amongst whom we noticed Mr. Wilkinson, the Egyptian traveller, and many scientific characters. We strongly recommend these lectures to the public. On Friday, Mr. Catlin lectured at the British Institution.

#### THE ROYAL IRISH ACADEMY.

[Concluded from page 106.]

"MR. LLOYD exhibited to the meeting a specimen of a remarkable substance recently found in the principality of Carolath, in Silesia. It formed part of a cloth of 200 square feet in surface, now in the possession of the King of Prussia. No description of this substance has yet been published; but Major Sabine and Mr. Lloyd were informed by Baron Humboldt (by whom the present specimen was kindly given) that M. Ehrenberg had examined it microscopically, and had found it to be an organic substance, consisting partly of vegetable and partly of animal matter;—the vegetable component being the *Conserva rivularis*; the animal, different species of *Infusoria*, of the family known by the name of *Bacillaria*. To illustrate the origin of this substance, Mr. Lloyd read the following note from Major Sabine, respecting a similar body which has been examined and described by M. Ehrenberg. 'In the year 1686, some workmen who had been fetching water from a pond seven German miles from Memel, on returning to their work after dinner (during which there had been a snow-storm), found the flat ground around the pond covered with a coal-black, leafy, or paper-like mass; and a person, who lived near, said he had seen it fall like flakes with the snow. On examination, some of the pieces were found to be as large as a table, and were lying upon each other to the depth of the thickness of a finger. The mass was damp, and smelt disagreeably, like rotten seaweed; but, when dried, the smell went off. It tore fibrously, like paper. Specimens were preserved in several collections, where it was known by the name of Meteor-paper, and by many was actually supposed to be a meteoric body. It has been recently examined by M. Ehrenberg, and found to consist partly of vegetable matter, chiefly *Conserva crispata* (common in Germany), and partly of *Infusoria*, of which M. Ehrenberg was able to recognise twenty-nine species. Of these, eight species have siliceous coverings; but the others, which are equally well preserved, were soft-skinned animals; most of them are known as species now existing. The meteor-paper, therefore, as it has been called, was formed in marshy places; had been raised into the air by storms of wind; and had again fallen. Substances of the same nature have been found in Norway, in Silesia, and in the Erz Mountains. In some instances they are described as leathery; in others, as resembling wadding, and being white on the upper side, and green beneath. They have probably all a similar origin.' Mr. Lloyd also laid on the table of the Academy a specimen of a very similar substance, which he had received from Sir John Herschel, and which was found investing the rocks at the mouth of one of the rivers of Southern Africa. It resembles the other very much in external appearance, except that the fibres are coarser, and more compactly matted together. It appears to consist almost entirely of *conserva*, but apparently of a different species.

A paper was read by Mr. J. Huband Smith, descriptive of certain porcelain seals, amounting to upwards of a dozen, found in Ireland within the last six or seven years, and in places very distant from each other. He exhibited to the Academy one of these seals, with impressions of several others in sealing-wax. He stated that they were all uniform, consisting of an exact cube, having, by way of handle, some animal (probably an ape) seated upon it; and that they were so precisely similar in size and general appearance as to be undistinguishable, except by the cha-

acters on the under surface. Little is known respecting these seals beyond the mere fact of their having been found in this country. An extract from the Chinese grammar of Abel-Rémusat shewed that the inscriptions on these seals are those of a very ancient class of Chinese characters, 'in use since the time of Confucius,' who is supposed to have flourished 'in the middle of the sixth century, before J. C.' The remote period to which these characters are assigned, leaves open a wide field for conjecture as to the time in which these porcelain seals found their way into this country. The situations in which some of them have been found are remarkable. One was discovered in ploughing a field near Burrisokane, county of Tipperary, in 1832; another was found last year at Killead, in the county of Down; another in the bed of the river Boyne, near Clonard, in the county of Meath, in raising gravel; and a fourth was discovered many years ago at a short distance from Dublin. From the extreme degree of heat to which they appear to have been subjected, and the consequent vitrification which has in some measure taken place, they are quite as capable of resisting the attacks of time as the glass and porcelain deities and ornaments found in the mummy-cases of Egypt, and may have lain for an indefinite period beneath the surface of the earth. It is therefore, at least, possible that they may have arrived hither from the East, along with the weapons, ornaments, and other articles of commerce, which were brought to these islands by the ships of the great merchant-princes of antiquity, the Phœnicians, to whom our ports and harbours were well-known. Mr. Smith then called the attention of the Academy to the remarkable discovery by Rosellini, Lord Prudhoe, and other recent travellers, of unquestionable Chinese vases in the tombs of Egypt. He read a passage from Davis's 'China,' in which some of them were described; and also an extract from Wilkinson's 'Ancient Egyptians,' from which it appeared that the number of Chinese vases found at Coptos, Thebes, and elsewhere, amounted to seven or eight, and that the inscriptions on them had been translated by Chinese scholars to mean, 'The flower opens, and lo! another year,' being a line from an ancient Chinese poem. From this the trade of China with distant countries, at a period of the remotest antiquity, being clearly proved, Mr. Smith submitted to the Academy that a case of strong probability had been made out, that the porcelain seals found their way into Ireland at some very distant period. In fact, if they be not of modern introduction into this country—a supposition which the situations in which several of them have been found seems utterly to preclude—their arrival here must of necessity have been most ancient.—Mr. Petrie read a paper 'On Ancient Seals of Irish Chiefs, and Persons of Inferior Rank,' preserved in the collections of Irish Antiquities formed by the Dean of St. Patrick's and by himself.

They were contemporary with Anglo-Norman seals, and belonged to O'Connor, king of Connaught, who died 1265; Donald Og (son of a King, or Prince of Desmond), who died 1200; Mac Con, a chief of Hy-Caislin, in Thomond; Brian O'Harny, a chief in Kerry, &c., and all in silver.

## PARIS LETTER.

Academy of Sciences, Feb. 18, 1840.

SITTING of February 10. — It was expected that M. Pelouze, the chemist, would have made

a reply at this meeting to M. Dumas, on his 'Theory of Chemical Substitutions;' but nothing of the kind took place.—M. Breschet read, in his own name and in that of Dr. Rayer, a memoir on the nature of glanders in the horse, and on the communication of it by contact to the human subject. He went into this matter at considerable length, and stated, that the experiments of German and English physicians, and veterinary surgeons, coincided with those of the French medical world, and also with the observations of the professors of the Royal Veterinary School at Alfort-sur-Seine in deciding that the glanders constituted a disease communicable to all kinds of animals. At the same time the symptoms, owing to the different development of the glands in the neck and head of the equine race from what took place in the human subject, were not altogether the same. M. Majendie, the celebrated chemist and surgeon, opposed this statement of M. Breschet; and declared his conviction, that the experiments adduced in proof of it were erroneous. He denied that a single well-authenticated case of the contagious communication of acute glanders (*morve aiguë*) could be adduced; and asserted, that the chronic glanders could never be communicated at all. Baron Larrey supported M. Majendie; and declared, that, throughout the long course of his military experience as head of Napoleon's medical staff, in all his campaigns, he had never heard of any cavalry soldier catching the glanders from a horse. A very animated discussion ensued, and was at one time in danger of being converted into an exchange of personalities. The topic was left undecided. The French medical world is much occupied with it.—M. Peltier wrote to the Academy, upon a case of a man having been struck by lightning, and at the same time carried many feet from the place where he was standing, to explain, that this phenomenon was to be accounted for on the principle of whirlwinds, by which heavy bodies were often caught up and transported to certain distances. He considered the person in question to have been subjected to an electric discharge from two clouds possessed of two kinds of electrical tension.—M. Biot presented to the Academy some photographic drawings from Mr. Talbot made on his sensitive paper, and which were admitted to be of great beauty. They shewed the lights and shades corresponding to those of the natural object the same as the Daguerrotype. M. Biot remarked, that Mr. Talbot, having succeeded in producing these effects with a winter sun, much greater results might be expected from the application of Mr. Talbot's improved method during the summer. M. Arago remarked, that M. Bayard had also succeeded in producing similar results by means of the sensitive paper of his own invention. Dr. O'Shaughnessy's method of using a solution of gold instead of nitrate of silver, and by which colours of some kinds were produced, excited a great deal of attention.—A communication was made from M. Joly of Marseilles, of the appearance at the mouth of the Rhone of two birds of the diver species, commonly found only in the Northern Ocean. It was believed to be the first time of this species having ever been found in France: and the circumstance was considered the more extraordinary, since the winter was of unusual mildness.—M. Roset addressed a paper to the Academy on the protuberances of quartzose formation, in a conical form, to be met with in the mountains between the Saône and the Loire. It appeared that veins of quartz have traversed all the older formations up to the lias; and, in some cases, these veins had so soldered strata together, that

it was difficult to believe that they had ever been separate. The calcareous formations in these mountains were stated to contain a great quantity of crystals of feldspar. In the vicinity of the quartz veins, the limestone became magnesia, and where the veins were numerous, it contained one-third of carbonate of magnesia in its substance.—M. Babinet has been elected a member of the Academy in the room of the late M. Dulong.

*Academy of Medicine.*—At the last sitting, Messrs. Jourard and Pariset presented a young Egyptian of rank, Mustapha Bey, son of Kurchib Pasha, who had come to France to be treated for a spontaneous luxation of the right thigh, as well as to pursue various studies. The Council of the Academy deputed Drs. Pariset and Bonvier to attend this case; and, as soon as Dr. Clot Bey, who is daily expected to arrive, should have given his opinion, to draw up a report on the subject.—Dr. Bérard communicated a new case of the *acute glanders* in a human subject caught from a horse, affected only with chronic glanders.

Professor Velpeau presented to the Academy a tumour recently cut off the scrotum of a young man aged 21, in which on examination there were found to be the remains of a fetus.—A discussion took place 'On the Nature and Causes of Rheumatism.' Professor Roux thought it arose from inflammation of the periosteum. M. Bouillard shewed that suppuration of the joints and of the muscular sheathings frequently accompanied rheumatism. M. Gerdy, on the contrary, expressed his conviction, that rheumatism was a disease of a perfectly peculiar nature, of which inflammation was a subordinate symptom.

*Académie Française.*—In the sitting of 16th January, M. Dupin proposed that the work of M. Gustave de Beaumont upon Ireland should be allowed to compete for the Monthyon prize, the destination of which was *pour l'ouvrage le plus utile aux mœurs*. M. Dupin passed a very high encomium upon this work, and his proposition was adopted unanimously.

M. Prat, a young and promising cultivator of national antiquities, has published a volume, entitled "Pierre l'Ermite, and the First Crusade." He has dedicated it to M. Guizot.—We see a work advertised for publication, entitled "La Tribune Française," being a selection of speeches and reports made to the several legislatures from 1789 to 1840, inclusive. It is to come out in numbers: the subject is *rather* extensive.

The 18th instant was the last day for artists sending in their works to the Louvre for the exhibition, which opens on the 1st of March. From what we have heard, the approaching *salon* will not be so good as usual. At all events, ten or twelve of the principal names will be wanting in the catalogue—either from foreign travel, or from illness, or other unavoidable causes. As a compensation for this the exhibition will, probably, be instructive as to the progress of the younger artists—the future painters of France.

Messrs. Coutures, brothers, of Bordeaux, glass-blowers, have just introduced an important improvement into the manufacturing of glass (black glass) bottles, by using a flexible tube, worked by machinery, for injecting air into the mass of fluid metal which is taken out of the glass pot at the end of the blower's stick. An ingeniously adjusted cock permits the workman to use just as much or as little air as he pleases; and while a great saving of labour to the man is effected, the bowl of glass is blown with much greater uniformity. These gentlemen, in a most praiseworthy manner, have

declined taking out a patent, and have at once given the benefit of their invention to the public.

M. Lerebours, the famous optician, whose well-known house is on the Pont Neuf, died at an advanced age on the 13th instant.—The celebrated Utzschneider, who, together with Fraunhofer, was the founder of the optical institution of Monaco in Bavaria, died at Rome on the 1st instant, in consequence of injuries received by the accidental overturning of a carriage.—M. Bohlen, the eminent orientalist, died in Italy a short time since.

#### LITERARY AND LEARNED. UNIVERSITY INTELLIGENCE.

OXFORD, Feb. 12.—The following degrees were conferred:—  
*Bachelor in Civil Law*.—E. E. Rushworth, Fellow of St. John's College.

*Masters of Arts*.—Rev. E. Daubeny, Demy of Magdalen College; Rev. C. Tomba, Scholar of Pembroke College; the Hon. C. L. Courtenay, Christ Church.

*Bachelors of Arts*.—R. Smith, St. Edmund Hall; J. Barclay, Christ Church; C. A. Fowler, Oriel College. The Rev. C. H. Hartshorne, M.A. of St. John's College, Cambridge, was admitted *ad eundem*.

CAMBRIDGE, Feb. 12.—The following degrees were conferred:—  
*Master of Arts*.—C. J. Drage, Emmanuel College; C. Sanderson, St. John's College; A. Anand, Jesus College.  
*Bachelor of Arts*.—F. W. Ellis, Trinity College.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday*.—Geographical, 9 P.M.; Medical, 8 P.M.  
*Tuesday*.—Medical and Chirurgical, 8½ P.M.; Civil Engineers, 8 P.M.; Zoological, 8½ P.M.; Architectural, 8 P.M.

*Wednesday*.—Society of Arts, 7½ P.M.; Geological, 8½ P.M.; Medico-Botanical, 8 P.M.

*Thursday*.—Royal, 8 P.M.; Antiquaries, 8 P.M.; Royal Society of Literature, 4 P.M.; Numismatic, 7 P.M.

*Friday*.—Royal Institution, 8½ P.M.

*Saturday*.—Westminster Medical, 8 P.M.

#### FINE ARTS.

BRITISH INSTITUTION.  
[Fourth and concluding notice.]

379. *The Blacksmith of Antwerp*. R. R. M'Ian.—Mr. D'Israeli, in his "Curiosities of Literature," has shewn the alliance between love and religion; we think that in the story of the Corinthian maid we can trace a more intimate connexion between love and the fine arts. Be that as it may, the latter affinity has never been better illustrated than by the subject of this performance; nor has the pictorial character of that subject ever been embodied with more truth and effect than by Mr. M'Ian's pencil.

159. *Love's Messenger*. J. Callcott Horsley.—A well-shot arrow from Cupid's bow. The fair but agitated nymph is evidently preparing slyly to possess herself of the amorous missive, while her aged and unsuspecting grandmother sits tranquilly near a window in the interior, illuminated, almost deceptively, with this able artist's usual skill.

109. *Hope Deferred*. H. Montague.—Unlike, in that respect, to the work just mentioned, here is no highly excited feeling. The sentiment is that of patient endurance and calm resignation. The group is tastefully designed, and sweetly executed.

430. *View of Moel-Ali, with a Hindoostanee Dance, and the Tame Tiger of Hyderabad, at the great Annual Procession to the Moham-medan Temples*. W. Havell.—On this splendid and crowded Oriental assemblage, Mr. Havell has shed a rich and appropriate glow of colouring. It seems that M. Van Amburgh does not stand alone in the art of subduing animal ferocity.

412. *The Night Life-Buoy*. C. H. Seaforth.—The triumph of science in one of the

most important inventions for the preservation of life, is here represented under an effect of light and colour which, although on the first view it may appear marvellous and supernatural, is, we have no doubt, in the peculiar circumstances of the case, strictly conformable to truth and nature. The Catalogue contains an interesting explanatory paragraph.

Having now given a sketch of some of the leading features of the Exhibition, principally in the department of works of imagination, subjects of familiar life, &c., we are reminded, not by any "lack of argument," but by our limits, that there remains a very prominent and interesting portion of the gallery to be disposed of (heartily do we wish it were "disposed of," in another sense), we mean the landscape and sculpture departments. In the former, the examples are too numerous to particularise; and we must content ourselves with briefly pointing out a few of those which took our fancy captive:—22. *Wood Scene, with Game-keepers*. F. R. Lee, R.A.—Highly picturesque, with a fine effect of light and warmth.

29. *Scene in Penuhurst Park*. By the same.—A retired, still, and romantic spot. 33. *At Haddon, Derbyshire*. T. Creswick.—A beautiful effect of chequered sun-light. 210. *Near Ashopton, Derbyshire*. By the same.—In picturesque character, or skillful execution, may vie with the best productions of Ruysdael or Hobbima. 83. *The Horse and Groom Subscription Water, Lea Bridge*. T. C. Holland.—Dear to the votaries of the angling rod must be this sort of fish preserves. 119. *A Lock on the Medway*. H. Jutsum.—The highly picturesque character of the landscape is accompanied by one of the most beautiful and silvery-coloured skies we ever remember to have seen, either in art or in nature.

143. *Part of Allington Castle, Kent*. J. Stark.—This relic of the olden time has been invested by the artist with all the harmony of his Anglo-Flemish pencil. 252. *Noon*. J. Linnell.—A beautifully romantic and sequestered glade, with all the glow of summer warmth in its effect on the rich and well-clothed foliage. There are many other clever works in this class of art, by J. B. Pyne, A. Priest, C. R. Stanley, A. Vickers, F. W. Watts, H. Bright, A. Clint, Mrs. Arnold (late Miss Gouldsmith), D. C. Read, &c. In old buildings, and in the picturesque character of foreign towns, the pencil of G. Jones, R.A. has been most brilliantly and successfully employed; as witness:—23. *Gate on the Danube, Ratisbone*; 220. *Geneva, the Bridge over the Rhone, in 1825*; and 227. *Old Buildings at Nuremberg*. T. Sidney Cooper exhibits five pictures, in which, of course, cattle form the principal subjects. They are worthy of his characteristic, skilful, and highly finished style of art. An admirable specimen of coast-scenery occurs in 240. *Scheveling Beach at Flood-tide*. G. Chambers. J. B. Crome has greatly distinguished himself by his admirable effects of moon-light. They are chiefly coast-scenes, and, in our humble opinion, are equal to some of the best pictures of a similar description by Vanderneer; we refer to Nos. 30, 162, 202, and 410.

We proceed to the sculpture; and we must say that, with all our respect for the classical subjects and finely proportioned forms which have emanated from the Grecian chisel, it is with great pleasure that we frequently contemplate, at home, productions scarcely inferior in abstract merit, and of much more familiar and touching interest. We make this remark on the present occasion with especial reference

to 462. *Dorothea, from Don Quixote*, J. Bell.—Whether we consider the graceful contour of the youthful and beautiful fugitive, or the natural expression of timidity and delicacy in her charming countenance, we have seldom seen a more captivating work of art.

447. *Design for the Nelson Monument*. E. H. Baily, R.A.—Although this exquisitely beautiful and appropriate model has been already submitted to the public eye, we are happy to observe it in a situation where it may be better seen and appreciated; and we trust it will eventually find a permanent place in some national edifice, where it may alike perpetuate the glory of Nelson, and the genius and skill of the artist.

464. *David*. 463. *The Captive*. J. G. Lough.—The grace of the Apollo in the first, and the severe style of Michael Angelo in the second, of these fine productions contrast admirably, and attest the talents and taste of the artist.

448. *Hercules rescuing Hesione from the Sea-monster*. W. Calder Marshall.—A splendid group, in which muscular strength and powerful action are finely contrasted by feminine weakness and graceful proportions.

There are several other clever proportions, by J. Denham, J. H. Foley, T. Thornycroft, E. Richardson, H. Cardwell, R. C. Lucas, T. Kirk, E. G. Papworth, J. Ritchie, Mary Francis. Some of them, however, are too much huddled together to be fairly inspected.

#### NEW PUBLICATIONS.

*His Royal Highness Prince Albert of Saxe Coburg and Gotha*. Engraved by James Scott, from a Picture by the Baroness de Meyhern Hohenberg. Boys.

A CLEVER and highly-finished mezzotinto. The expression of the countenance is remarkably pleasing, and the general management of the portrait does the baroness great honour.

*Findens' Female Aristocracy of Great Britain*, No. 11.

"THE Duchess of St. Albans," painted by John Hayter, engraved by W. H. Eglington; "Lady Augusta Cadogan," painted by John Hayter, engraved by H. Robinson; and "The Hon. Mrs. W. Ashley," painted by John Bostock, engraved by John Thomson, are the three fair and noble illustrations of the present number.

*Plans, Elevations, and Sections of the Alhambra*. From Drawings taken on the spot in the year 1834, by the late M. Jules Gourry, and Owen Jones, Architects, Nos. 8 and 9. Ackermann and Co.

THIS extraordinary publication, to which we have already on more than one occasion called the attention of our readers, is proceeding with undiminished splendour and excellence. The exquisite precision, delicacy, minuteness, and truth, with which the elaborate details of that beautiful specimen of Moorish architecture, the Alhambra, are given, and the equally novel and gorgeous manner in which a considerable number of the plates are printed in colours, will, undoubtedly, when it is completed, render it by far the most curious and valuable work of the kind that has ever appeared. The portions of the magnificent edifice illustrated in the numbers immediately under our notice, are principally,—"The Hall of the Two Sisters," "The Court of the Mosque," "The Court of the Fish-pond," "The Hall of the Abencerages," "The Baths," and "The Hall of Justice."

*Canadian Scenery*, by N. P. Willis, Esq. Illustrated in a Series of Views, by W. H. Bartlett. Part I. Virtue.

"It scarce needed the attitude which Canada has lately assumed towards the mother country," observes Mr. Willis, "to make its scenery, its history, its manners, customs, and condition, matters of strong interest. The forcible contrast which it presents to the eye and the mind must, and does, interest the most casual observer, as well as the most thoughtful philosopher:—the Indian wigwam on one shore of the St. Lawrence, and the Viceroy's palace on the other,—the red and white man meeting in every street and path,—the frail canoe and the gigantic steamer passing on all its broad waters,—the parching of the Indian's frugal corn, and the preparation of the luxurious dinners of the hotel, wreathing their smoke together over the forest tops,—the clashing of the lawless custom of the savage with the severe and inflexible code of civilised Europe,—all these extremes, with their numberless intermediate degrees, combining all possible stages of refinement, civilisation, and moral condition, render Canada a most interesting field for either the pencil or the pen."

Of Mr. Bartlett's talents we have frequently had occasion to speak, more especially with reference to his illustrations of Dr. Beattie's "Switzerland." They promise to be at least as finely exemplified in the present publication. Of the several plates in this first part, we would point out "Wigwam in the Forest," "Rapids on the Approach to the Village of Cedars," and "Quebec," as peculiarly picturesque and beautiful.

#### ORIGINAL POETRY. TO PRINCE ALBERT.

THE cliffs of England!—Know'st thou where  
Their crested heights the sea-birds sweep?  
Know'st thou the cliffs which point 'mid air,  
Like holy spires which Sabbath keep?  
It is thine own adopted land!—  
The birthright of thy royal bride!—  
The kingdom that awaits thy hand!—  
And for her sake, who crowns thy side,  
True love for those white cliffs evince,  
And British hearts will hail their Prince!  
It is a land whose fame hath rung  
Where'er her "Christian Flag" hath flown!  
When Justice, Mercy, Freedom sprang  
To grace her sword, and guard her throne!  
A land that God designed to be  
An ark on Persecution's tide;  
A home for sacred Liberty!  
A haven midst the nations wide.  
Oh, for that land thy love evince,  
And British hearts shall bless their Prince!  
A true descendant of that line  
Which stood 'tween Luther and the brand,  
Will fence, as with a shield divine,  
The Christian altars of our land!  
Guard England's honour, 'tis thine own!  
And to a royal race impart  
The noblest treasure of the throne  
Is centred in a people's heart!  
Yes, love for Britain's weal evince,  
And British hearts shall bless their Prince!  
And to thy quaggy bride—yet more  
May every day's affection prove  
That brightest crowns fade dim before  
A husband's living crown of love!  
May Plenty breathe her joyous song,  
In peasant cot, on village green,  
And Love, than thousand armies strong!  
Still shield our Albert and our Queen!  
The cliffs of England!—Know'st thou where  
Their crested heights the sea-birds sweep?  
Know'st thou the cliffs that point 'mid air,  
Like holy spires which Sabbath keep?  
Oh, love for those white cliffs evince,  
And British hearts shall bless their Prince!

Manchester, February 20th, 1840. CHARLES SWAIN.

#### BIOGRAPHY.

SIR JEFFRY WYATVILLE, R.A.

OUR obituary this week is darkened by the death of this distinguished architect and Royal Academician, who died on the 18th inst. aged seventy-

four. Sir Jeffry changed his name by royal patent from Wyatt, chiefly, we believe, to individualise himself from the number of his family relatives whose high distinction in the arts of sculpture, painting, and architecture, rendered some means of distinction desirable. He was nephew to the celebrated Mr. Wyatt (in whose office he studied), the father of Benjamin Wyatt, and M. Cotes Wyatt, who, as well as George, Henry, and we know not how many of the same name, have all like himself been intrusted with the execution of great and public works. The royal residence, Windsor Castle, exhibits the most permanent and important memorials Sir Jeffry, succeeding his uncle there, has left us of his skill and genius.

#### THE DRAMA.

*Olympic*.—A new piece, under the title of *French Polish*, has been successfully brought out here; and is well supported by the talents of Mr. Moses Barnett.

#### THE LEGEND OF FLORENCE.

WE were cribbed and confined in our examples last week, and now return to the *Legend*. Firstly, to give a specimen of its lighter humours. Colonna, in ridiculing the poet's imaginative faculty, begins:—

"Oh, say: a time will come—  
Poet and prophet—Redeunt Saturnia regna,  
Now hear him on his favourite dross theme,  
'A time will come!—a time—oh! when all marriages  
Shall be like some few dozen; exceptions, rules;  
Every day, Sunday; and each man's pain in the head  
A crowning satisfaction!"

*Da Riva*. No; but still  
A time, when sense and reason shall have grown  
As much more rife than now, and foolish thorns  
As much less in request, as we, now living,  
Surpass rude times and savage ancestors.  
Improvement stop'd not at the muddy cave,  
Why at the ruck-strewn chamber? The wild man's  
dream,

Or what he might have dreamt, when at his wildest,  
Is, to the civilised man, his commonplace:  
And what should time so reverence in ourselves,  
As in his due good course, not still to alter?

*Colonna*. Till chariots run some twenty miles an  
hour?

*Da Riva*. Ay, thirty or forty.  
*Colonna*. Oh! oh! Without horses?  
Say, without horses.

*Da Riva*. Well, to oblige you,—yes.  
*Colonna*. And sailing boats without a sail! Ah, ha!  
Well, glory be to poetry and to poets!  
Their cookery is no mincing! Ah! ha! ha!

[They both laugh.]  
They certainly, while they're about it, do  
Cut and carve words out, with their golden swords,  
To which poor Alexander's was a pumpkin."

Part of a scene between Agolanti and his  
suffering wife, is a fair specimen of both  
characters:—

"I will not have these prying idlers  
Put my domestic troubles to the blush;  
Nor you sit thus, in ostentatious meekness,  
Playing the victim with a pretty breath,  
And smiles that say, 'God help me.'—Well, madam,  
What do you say?"

*Ginevra*. I say I will do whatever  
You think best, and desire.  
*Agolanti*. And make the worst of it  
By whatsoever may mislead and vex?  
There—now you make a pretty sign, as though  
Your silence were compell'd.

*Ginevra*. What can I say,  
Or what alas! not say, and not be child?  
You should not use me thus. I have not strength  
for it,  
So great as you may think. My late sharp illness  
Has left me weak.

*Agolanti*. I've known you weaker, madam,  
But never feeble enough to want the strength  
Of contest and perverseness."

"*Ginevra*. Oh, could you trust yourself—But why  
repeat

What still is thus repeated day by day,  
Still ending with the question, 'Why repeat?'

[Rising and moving about.]  
You make the blood at last mount to my brain,  
And tax me past endurance. What have I done?  
Good God! what have I done, that I am thus  
At the mercy of a mystery of tyranny,  
Which from its victim demands every virtue.  
And brings it none."

Rondinelli, previous to the spectral appearance of Ginevra:—

"A gentle night, clothed with the moon and silence.  
Blessed be God, who lets us see the stars:  
Who puts no black and sightless gulf between  
Those golden gazers out of immensity,  
And mortal eyes, yearning with hope and love!—  
She's now a blessed spirit beyond those lights,  
With happy eternal cheek. And yet, methinks,  
Serious as well as sweet is bliss in heaven,  
And permits pity for those that are left mourning.  
Gentle is greatest and habitual nature!  
Gentle the starry space! gentle the air!  
Gentle the softly ever-moving trees!  
Gentle time past and future! both asleep.  
While the quick present is loud by daylight only.  
And gently I come to nature, to be worthy  
Of comfort and of her, and mix myself  
With the everlasting mildness in which she lives—  
Sweetest and best! my couch a widower seems,  
Altho' it knew thee not; and I came forth  
To join thee as I could; for thou and I  
Are thus unhoused alike, and in no home.  
The wide earth holds us both.

*Ginevra enters, and halts apart, looking at him.*

*Ginevra*. Antonio!  
*Rondinelli*. Oh, earth and heaven! What art thou?  
*Ginevra*. Fear not to look on me, Antonio!

I am Ginevra—buried, but not dead, me in.  
And have got forth and none will let me in.  
Even my mother is frighten'd at my voice;  
And I have wander'd to thy gentle doors.  
Have pity on me, good Antonio,  
And take me from the dreadful streets at night.

*Rondinelli*. Oh, heaven! Oh, all things terrible and  
beautiful!

Art thou not angel, shewing me some dread sight  
Of trial and reproof? Or art thou indeed  
Still living, and may that hand be touch'd with mine?

[She has held out her hand to him.]  
*Ginevra*. Clasp it, and help me towards thy door;  
for wonder,

And fear, and that long deadly swoon, have made  
Me too, a terror to myself."

Our last quotation illustrates the whole  
structure of the author's thoughts and style  
in composition:—

"*Rondinelli*. Five blessed days, and not a soul but we  
Knows what this house in its rich bosom holds.  
The man whom dear Diana bribed to secrecy  
For our sakes, is now secret for his own;  
And here, our guest is taken for a kinswoman,  
Fled from a wealthy but a hated suitor,  
Out of no hatred, haply to myself;  
For which, as well as for her own sweet sake,  
The servants love her, and will keep her close.  
She holds my mother's hand, and loves her eyes;—  
And yestern evening she twice spake my name,  
Meaning another's. Hence am I most proud,  
Hence potent; hence, such bliss it is to love  
With smallest thought of being loved again,  
That though I know not how this heav'n on earth  
Can change to one still heavenlier, nor less holy,  
I am caught up, like saints in ecstasies,  
Above the ground;—tread air;—see not the streets  
Through which I pass, for swiftness of delight,  
And hugging to my secret heart one bosom.  
I live as though the earth held but two faces,  
And mine perpetually look'd on hers."

*Haymarket*.—On Monday Mr. Allcroft's  
Concert, held at this theatre, was fully at-  
tended. The programme promised, and the  
musicians performed, rather too much; for six  
hours did we listen to their sweet sounds.  
The arrangement was good, and the hearers  
gratified by a greater portion of ballad music  
(which we hold to be the most charming) than  
usual. Among the choice performances of the  
evening were the *O Dolce Concerto*, sung by  
Miss Woodyatt, with flute obligato by Mr.  
Richardson. Grand fantasia on the piano-  
forte, by Madame Dulcken. Ballad, "They  
ask me to forsake the wreath," sung by Miss  
Woodyatt; and fantasia, trombone, Mr. Win-  
terbottom. Mr. Benedict's absence was apolo-  
gised for, and Mr. Henry and Madame Dulcken  
performed a fine duet as a make-up for his  
loss. There was some vocal music not above  
mediocrity, which could have been well spared.  
Some laughter was caused by a mistake touch-  
ing an encore.

*Miss Chambers' Concert*, which was fixed for  
the 10th, was necessarily postponed in con-  
sequence of the queen's marriage. We hope  
our notice of it for that day, in the hope of  
serving so good a cause, will not prejudice

the entertainment now to be given on Monday next.

### VARIETIES.

**Opening Public Places to the People.**—On Monday the 10th, the Norwich Museum was opened to the public gratuitously, in honour of her Majesty's wedding-day; 500 persons being admitted for half an hour, to be succeeded by other 500. This method was resorted to by reason of the great pressure at first. Upwards of 6000, mostly of the working class, were admitted during the day; and so great was their delight and good behaviour as to encourage the Committee to order, that henceforth the Museum shall be opened—free on the first Monday of every month. [This is another good example.]

**Anticipated Destruction of Kew Gardens.**—The Earl of Surrey, lord-treasurer of her Majesty's household, has just made, on the part of the government, an offer to the Council of the Horticultural Society, to sell the whole of the unrivalled collection of plants in the Botanic Garden at Kew! This far-famed garden was founded by a princess of the house of Saxe-Gotha, the illustrious predecessor of his royal highness Prince Albert, and wife of Frederick, prince of Wales. It was laid out by Sir William Chambers. It contains, and has always contained, the finest collection in the world. It was a source of great interest to George the Third, and to his consort, Queen Charlotte; and, in more recent times, to George the Fourth and William the Fourth: the last-named monarch erected the splendid new conservatory. The whole expense of the Gardens, including every thing, even to money paid to the assistant-gardeners, does not exceed 1000*l.* a-year. The Council of the Horticultural Society refused to purchase, and expressed their sorrow and regret at the offer having been made, viewing it as a national misfortune. Since the rejection of this proposal, we are assured that in a few days the plants will be given to those who ask them! The palm-house, which contains some of the finest specimens in Europe, could not be replaced under any circumstances; the plants must inevitably perish—they cannot be removed and prosper, for they are planted in the soil. The collection also of Australian plants is unequalled, both in extent and in the size and beauty of the specimens; removal of them will also be followed by destruction. In fine, the garden contains the vegetable treasures brought home by Captains Cook, Vancouver, Tuckey, and other distinguished navigators; and the anticipated abandonment by the government is viewed by the whole of the scientific circles in the metropolis with feelings of the deepest regret.

**Fine Arts.**—Mr. Haydon has been spreading a taste for the fine arts by giving courses of lectures at Hull and Leeds, of the effects of which we have received very gratifying accounts. Bath, we believe, now receives his eloquent instructions: in which, first, the Principles of Art; second, the State of Art; and third, the History of Art, are the great divisions dwelt upon. His picture of the Duke and his immortal horse Copenhagen, twenty years after the battle of Waterloo, is being engraved by Lupton, and the etching (of high promise) nearly completed.

Mr. James Knowles, author of the "New English Dictionary" under his name, and father of Mr. Sheridan Knowles, died on the 6th, at his son's house in Alfred Place, in his eighty-second year. The fame so fairly won by that son must have been a source of great

happiness to the old man, whose laborious literary life could not have been productive of much enjoyment. Mr. Knowles was cousin to the late Richard Brinsley Sheridan, and, consequently, distantly related to the noble houses of Somerset, Granley, and Dufferin.

**An Election Pun.**—At an election dinner lately, a voter said he had never received a bribe to the extent of a farthing. "Oh! Smith, how can you say so?" observed another voter; "when I know that Mr. W. sent you a hare." "Ay, that's true enough; but it was full of maggots." "Well, then," was the rejoinder, "if it were not bribery it was corruption."

*Laurels*  
Men gaze on brows which laurels bind,  
And long for their repute;  
But they who wear the foliage find,  
That poison fills the fruit.—I. O.

### LITERARY NOVELTIES.

#### LIST OF NEW BOOKS.

Miss Jackson's Pictorial Flora; or, British Botany delineated, 8vo. 15*s.*—On the Anatomy of the Breast, by Sir Astley Cooper, Bart., royal 4to. and Atlas of Plates, 3*l.* 3*s.*—Miss Edgeworth's Parent's Assistant, new edition, 3 vols. 18mo. 9*s.* half-bound.—The Oxford University Calendar, 1840, 6*s.*—Practical Remarks on Currency and Banking, by a Scotch Banker, 8vo. 1*s.* 6*d.*—The Spirit of the Church of Rome, by T. ### METEOROLOGICAL JOURNAL, 1840.

February.	Thermometer.	Barometer.
Thursday ... 13	From 37 to 48	29.69 to 29.79
Friday ... 14	... 36 to 42	29.85 to 29.87
Saturday ... 15	... 37 to 45	29.79 to 29.86
Sunday ... 16	... 43 to 52	29.69 to 29.80
Monday ... 17	... 50 to 45	29.98 to 30.01
Tuesday ... 18	... 31 to 41	30.12 to 30.15
Wednesday 19	... 32 to 36	30.19 to 30.26

Wind S.W. till the morning of the 17th. Since, N.W. and N.E.

On the 13th, generally clear; morning and evening of the 14th, foggy; also the morning of the 15th; since, generally overcast, with frequent falls of sleet and snow during the last three days, though the barometer, which has not been so high since the 11th of January, continues to rise.

Nearly one-tenth of an inch of rain fell on the afternoon of the 15th.

Rain and melted snow, -11*s.* of an Inch.  
Edmonton. CHARLES HENRY ADAMS.

### TO CORRESPONDENTS.

Scarcely is an exhibition of modern pictures ever opened in London, without our receiving complaints such as those of "H." No doubt injustice is occasionally done, but we do believe seldom intentionally. The good places are limited in number, and whoever finds that he does not occupy one of them is naturally dissatisfied.

### ADVERTISEMENTS.

Connected with Literature and the Arts.

### BRITISH INSTITUTION,

PALL MALL.

The Gallery for the Exhibition and Sale of the Works of British Artists is open daily, from Ten in the Morning until Five in the Evening.

Admission, 1*s.* Catalogue, 1*s.*

WILLIAM BARNARD, Keeper.

### CATLIN'S NORTH AMERICAN IN-

DIAN GALLERY, Egyptian Hall, Piccadilly. Containing 500 Paintings, made by his own hand, during Seven Years' Travel and Residence amongst the Wildest Tribes of Indians in North America. And also an immense Collection of Indian Curiousities—Dresses—Weapons, &c.; and a Crew Wigwam, twenty-five feet high—a magnificent specimen. Open daily from 10 to 6.—Admission, One Shilling. (The Rooms are now comfortably warmed.)

Mr. Catlin's Three Lectures on the Manners and Customs of these People, will be delivered this Week, on Tuesday, Thursday, and Saturday Evenings, commencing at Nine o'clock, precisely.

Tickets for the Course, 6*s.*—Single Tickets, 2*s.* 6*d.*

### KING'S COLLEGE, London.—Senior De-

partment.—The Council are ready to Receive Applications from Gentlemen, being Members of the United Church of England and Ireland, who are desirous of becoming Candidates for the Professorship of Geology.

Applications must be sent, under cover, to the Secretary (if any further information may be obtained), on or before Monday, the 9th of March next. By order of the Council.  
18th February, 1840. H. SMITH, Secretary.

### HANWELL COLLEGIATE SCHOOL,

MIDDLESEX.—Principal, the Rev. J. A. Smothers, M.A. Organ Curate of Hanwell.—Parents and Guardians desirous of selecting a School in a Healthy Situation, combining the Intellectual advantages of a Collegiate Course with Religious Instruction, Moral Training, and Domestic Care, on liberal Terms, may obtain Prospectuses on application (if by letter, please) to the Rev. T. T. Walsley, D.D. Rector, Hanwell; J. D. Macleir, Esq. D.C.L. Principal of Magdalene Hall, Oxford; and of the Principal at the School.

### ARCHITECTS.—Notice is hereby given,

that the Trustees appointed by Sir John Soane will meet at the Museum, 13 Lincoln's Inn Fields, on Tuesday, the 24th day of March next, at Three o'clock in the Afternoon, precisely, to Distribute the Dividends which shall have accrued during the preceding year from the sum of £4000, reduced 3 per Cent Bank Annuities, invested by the late Sir John Soane, among his Architectural and the Widows and Children of Deceased Architects, left in destitute or distressed circumstances.

Forms of Application may be had at the Museum, and must be filled up and delivered there on or before the 16th day of March, after which day no Application can be received.

### CROOK, having undertaken an Herculean

task in embodying the recorded charities of Westminster, requiring considerable time, as appears in the advertising columns of this "Gazette," has now prepared for immediate Publication, by Subscription or otherwise, "A National Anniversary," originating on the Marriage of our Most Gracious Sovereign the Queen.

### MASTER HUMPHREY'S CLOCK.—

**A HISTORY OF BRITISH FERNS.**  
By EDWARD NEWXAN, F.L.S.  
This Work is designed for Scientific Botanists, Students, and those who are cultivating Ferns and other Plants in closed glass cases. It gives a Figure of every British Species and Variety, drawn on Wood by the Author, and in every instance from Nature, showing the Distinctions of the Veins, the Mode of Fructification, and Manner of Growing. The Letterpress gives the Geographical Range, all the known Localities of Rare Species, a List of Synonyms, and a full Description of each Species and Variety.  
John Van Voorst, 1 Paternoster Row.

**MR. BRENNER'S TRAVELS IN THE NORTH OF EUROPE.**  
In 3 vols. 8vo. with Portraits, 5s. bound.  
**MR. BRENNER'S NORWAY, DENMARK, and SWEDEN.** With Notices of the State of Public Opinion in those Countries, and Anecdotes of their Courts.

"There is not a single reader of Mr. Brenner's admirable book on Russia, who will not be delighted again to encounter a traveller who unites in himself so many excellent qualities. With liveliness and bonhomie to please the most idle of readers; with good sense and impartiality to satisfy the most critical; with activity, information, and judgment, to turn all these good qualities to account, and a position in society that enables him to do so, are the chief characteristics which Mr. Brenner brings to the conception of this new work. On every subject which it touches—politics, statistics, public feeling, social habits and condition, agriculture, letters, science, personal character—all is treated with impartiality and strong good sense."—*New Monthly*.

Also,  
**Mr. Brenner's Russia, including Sketches** of the Emperor Nicholas and his Court. 3d. and cheaper edition, in 2 vols. post 8vo. with Portraits, 5s. bound.

"Of the various books that have recently appeared on the subject of Russia, this seems to me decidedly the best. It is written throughout with great ability and wonderful impartiality."—*Examiner*.  
Henry Colburn, Publisher, 15 Great Marlborough Street.

**ROBINSON'S CATALOGUE, No. I.** is now published, and contains, besides a Number of Miscellaneous Works, the Classes of Agriculture, Bibliography, Biography, Chemistry, and Part of the Greek and Latin Classics.  
Purchasers of Books may have Copies forwarded gratuitously, on application at 40 High Holborn, London.

**NEW ZOOLOGICAL WORK.**

**NATURAL HISTORY OF QUADRUPEDS, and other MAMMIFEROUS ANIMALS;** comprising a Description of the Class Mammalia (including the principal Varieties of the Human Race), with an Introduction, consisting of an Outline of the Osteology and Organization of its several Groups;—carefully adapted for Popular Information, and rendered interesting by copious details of their Physical and Intellectual Powers, Instincts, Habits, and Geographical Distribution. Part II. on the 1st of March.  
By WILLIAM CHARLES LINNEUS MARTIN, F.L.S.  
With about 1500 Engravings, of which above 500 will consist of representations of Animals, beautifully engraved on Wood, from Drawings by William Harvey; besides numerous Anatomical, Osteological, and other Figures, incorporated with the Text.  
Whitehead and Co. 78 Fleet Street, London.

In 3 vols. post 8vo. with Illustrations, price 31s. bound.  
**A WINTER IN ICELAND and LAPLAND.**

By the Hon. ARTHUR DILLON.  
"The north of Europe presents much curious matter for investigation that has not yet been explored as it deserves. Iceland and Lapland are all but unexplored regions. Mr. Dillon, insured to the hardships of a northern winter, was induced by the interest he took in three nations, to attempt the hazardous expedition of visiting them in their remote and unfrequented homelands; and these volumes, full of information, historical and descriptive, are the result of a journey not less creditable to his literary character than his courage. Of Iceland he gives a very full account, tracing the progress of the country from the earliest records of the first physical descent on the island, in the ninth century, to the present time. The history is a sort of sea romance, in which all the actors are marked by the strong features of a hardy climate and a daring spirit."—*Atlas*.  
Henry Colburn, Publisher, 15 Great Marlborough Street.

In 1 vol. 8vo. with Map, 15s. cloth, lettered.  
**OBSERVATIONS ON THE FINANCIAL CREDIT OF THE STATES OF THE NORTH AMERICAN UNION** as have contracted PUBLIC DEBTS; comprising an Account of the Manner in which the same raised by each State have been applied, and a Consideration of the probable Effects of such Application upon the general Wealth and Prosperity of the Country.  
By ALEXANDER TROTTER, Esq.  
London: Longman, Orme, and Co.

In 8vo. Vol. I. price 9s. of  
**THE HISTORY OF THE CHURCH,** translated from the German of the Rev. J. J. DOLLINGER, D.D. Professor of Theology in the Royal University of Munich.

By the Rev. EDWARD COX, D.D.  
Of St. Edmund's College, Old Hall Green, Herts.  
To be completed in Five Volumes.  
We may safely state, that the appearance of any work of the learned Professor Dollinger, in the English language, would be most acceptable to our country. But the universally acknowledged want of Ecclesiastical History in our language will, it is trusted, render the appearance of the present work the more acceptable to all who desire to become acquainted with the first institution, and the many interesting events which have accompanied the progress of the Church of Christ. The volumes will be found rich in learned disquisitions, which, from the depth and originality of thought which distinguish them, cannot fail to be interesting and pleasing to all.  
London: Published by C. Dolman, 61 New Bond Street; T. Jones, 65 Paternoster Row; and sold by Booksellers and Co. Kensington Street, Liverpool.

**DAVIES' KEY TO HUTTON'S MATHEMATICS.**  
In 1 thick vol. 8vo. price 3s. boards.  
**SOLUTIONS OF THE PRINCIPAL QUESTIONS OF DR. HUTTON'S COURSE OF MATHEMATICS:** forming a General Key to the Works. Designed for the Use of Tutors and Private Students.  
By THOMAS STEPHENS DAVIES, F.R.S. Lond. and Edin.

"It also appeared likely to us, that even in those seminaries where Hutton's Course was not the usual text-book, the great number of examples which it contained, combined with the complete solutions, or indications of the methods of solution, as here given, would render it a useful auxiliary and work for occasional use."—*Profrase*.  
London: Longman, Orme, and Co.; T. Cadell; J. Richardson; J. M. Richardson; J. G. F. and J. Rivington; Hamilton and Co.; Whittaker and Co.; Duncan and Malcolm; Simpkin, Marshall, and Co.; J. Sower; Cornish and Co.; Smith, Elder, and Co.; W. M. Allen and Co.; Harvey and Davison; Houston and Monahan; H. Washbourne; and C. Dolman. Edinburgh: Stirling and Co.

**CHINA.**  
*Under the Superintendence of the Society for the Diffusion of Useful Knowledge.*

**THE CHINESE; a General Description of the Empire of China and its Inhabitants.**  
By JOHN FRANCIS DAVIS, Esq. F.R.S.  
Late his Majesty's Secretary and Superintendent of China.  
A new edition, in 3 vols. illustrated with Woodcuts, price 9s. in cloth.

"In Mr. Davis's account of China, we find every subject brought forward that can throw light on the laws and institutions of a people to whom, we think, that justice has not been rendered by foreigners which is their due. Mr. Davis brings to his task advantages which have fallen to the lot of few Europeans. He resided twenty years at Canton, where he at length rose to be chief of the factory; he accompanied Lord Amherst's embassy to Peking; and he ranks as one of our best European writers on the rapidly changing language and literature of China. He has rendered into English several pieces from their romances, their poetry, and their dramatic works, of which less class, in all tongues, but more especially in the unique tongue of China, it is particularly difficult to preserve the spirit in a translation. We have a right, therefore, to consider the statements which he has now submitted to the public, as containing as full and correct a view of this singular people, of their government, laws, and institutions, and, in short, of the whole frame of their society, as the many difficulties with which the subject is beset will admit."—*Quarterly Review*.

A few of the fine edition, in post 8vo. price One Guinea, are still on sale.  
London: Charles Knight and Co. 25 Ludgate Street.

**MISS CORNER'S HISTORICAL LIBRARY FOR YOUTH, SCHOOLS, AND FAMILIES.**

Henry Colburn, Publisher, 13 Great Marlborough Street.

At all the Libraries, in 3 vols.

**THE DIARY of a NUN.**  
"The Diary of a Nun" is a love-story of the most exciting nature; its scene, that home and birth-place of love, Italy; its persons of that class who have nothing else to do but love and be loved; and its writer of that ex and time of life to which love is as natural and necessary as to us we breathe. This singular and pleasing work has a threefold claim on the reader: first, as a romantic narrative of the fatal passion of a young and high-born English woman, for the husband of her dearest friend; secondly, on account of the highly pleasing manner in which the truth of a traveller's narrative is blended with the fiction of a graceful, yet passionate imagination; and, thirdly, on account of the many original and characteristic personal descriptions which are presented to us of many of the most celebrated men and women of existing continental society; rendering it altogether one of the most attractive books which have appeared for a long time."—Sun.  
Henry Colburn, Publisher, 13 Great Marlborough Street.

### REVIEW OF NEW BOOKS.

#### THE SLAVE TRADE AND SLAVERY.

*Travels in the West. Cuba; with Notices of Porto Rico, and the Slave-Trade.* By David Turnbull, Esq. M.A. &c. 8vo. pp. 574. London, 1840. Longman and Co.

THIS volume is rather prolix and particular, and not free from needless repetitions; so that we must report its chief use and value to consist in the data it furnishes respecting the state of the slave-trade and slavery in the Spanish colonies, whence remedial measures may be devised for the abolition of the inhuman traffic. Mr. Turnbull's tour was performed in 1837, 8, 9, and his view of Cuba belongs to the middle year. The leading points which he illustrates are the abuses hitherto carried on under the Portuguese flag; the probability that when that is put down, the same will be perpetrated under the flag of America; the employment of British capital in partnerships with foreign slavers, and the export of British goods as the price of slaves on the African coast; and, finally, the immense profits on these cruel adventures, which are insurable in the usual way, and which render them too great temptations to mercantile avidity, even precarious as they are and without the covering protection of any national flag.

The information upon these topics may direct us towards the best steps for completing the good work on which so much of the blood and treasures of Great Britain have been expended; and, we lament to add, as yet so fruitlessly. Mr. Turnbull's intelligence, obtained by personal inquiry on the spot, must possess great weight; and it is with some degree of comfort we observe that, in his estimate of the extent of the evil (monstrous though it is), he differs considerably from the calculation of Mr. Buxton, as he elsewhere questions the opinions of Dr. Bowring, and other theoretical writers. We quote a few passages on these subjects:—

"The Cuba proprietors are regaining their lost ground, by the introduction of steam-boats and the construction of railways; and I fear that those of our capitalists who, tempted by the high rate of interest, have lent their money to the colonial government of the island, for the purpose of defraying the expense of making the railway to Guines, have not sufficiently reflected on the baneful consequences of their proceeding. Every shilling of English capital laid out in the island, either in the extension of cultivation or the cheapening of produce, serves to fetter some poor negro in the interior of Africa, or to rivet the chains of those now toiling in the cane-fields or the sugar-houses of Cuba. The holders of shares in the Brazilian mining companies are still more directly connected with the slave-trade. It is well known that the mines of that country are worked by slave labour; so that every shareholder is not only a slave-owner, but, by the purchases of newly-imported Africans, which are constantly made by the managers of the company, becomes a most efficient promoter and encourager of the slave-trade. If those ladies and gentlemen 'who live at home at ease' were only to witness some portion of the enormities committed by means of their money, and to pro-

mote their advantage, they would spurn from them the contaminated gains with loathing and disgust."

The fate of the slaves captured by our cruisers, and nominally set free, seems to be nothing better than their being landed and continued as slaves. The following extract speaks volumes:—

"On comparing the extent of coast on the continent of Africa, within which the trading barbarians find the means of purchasing cargoes from the native savages, with the corresponding extent of coast of those countries where the sales are effected, it will be found that the line on which the debarkations take place, comprising Cuba, Porto Rico, and the Brazils alone, without including the suspected coasts of Texas, Louisiana, Alabama, and Florida, is more considerable by at least 1500 or 2000 miles than that on which the shipments are obtained. It is worthy of consideration, therefore, whether the great object of suppression might not be more effectually and more cheaply attained, by confining the attention of our cruisers to the coast of Africa, and there accumulating all the force we can afford to maintain for the accomplishment of an object so ardently and unanimously desired by her majesty's subjects in all parts of the world. Until the total suppression is finally achieved, it is not to be doubted that seizures will be made by our cruisers, that sentences of condemnation will be pronounced by the several courts of mixed commission as well as by our own courts of admiralty, and that numerous captives will remain for disposal, if not for prompt emancipation. According to the old system, these unfortunate captives, although nominally free, were instantly hurried into an abyss of misery more deplorable and more desperate than that of the regularly imported African; who, if his lot be cast in Cuba, is destined within ten years to die of excessive labour, starvation, and the lash, that the people of Russia and the United States, the chief purchasers of the produce of that island, may drink their coffee, and sweeten it more cheaply. If emancipated at the Havana, the seat of one of the mixed commissions, they were formerly handed over to the Spanish authorities, who hired them out for seven years to the best bidder. The necessary consequence was, that the party who engaged their services had not even an interest in keeping them alive after the lapse of that period, and lay under no obligation, either legal or conventional, to support them when disabled by sickness or accident. The very name by which the unhappy survivors are distinguished has thus become a term of reproach; and if you ask your pampered household slave at the Havana who some wretched creature may be that has appealed to you for charity, he will answer you with a sneer, that he is an English 'Emancipado.' All those who outlived this first term of apprenticeship fell back into the hands of the local authorities, who did not scruple to hire them out for a second period of seven years, in the course of which their condition was as hopeless, and their daily and nightly toil as totally unrequited, as before. On the departure of Captain-General Tacón,

he caused a memoir to be published in defence of the measures of his administration; but as the strict censorship of the press was interposed to prevent the circulation of any answer to it, the laudatory statements it contains are not entitled to much attention. Governor Tacón was accused of deriving a rich revenue, not merely from the contraband importation of slaves, but from the disposal of the services of such as had been liberated under the judgments of the court of mixed commission. At first it was understood that these emancipados were not to be sent out of the Havana, in order to afford them a better chance of acquiring some of the elements of civilisation during the period of their apprenticeship; and I have been assured that this rule was enforced during the administration of Vives and Ricafort. When Tacón assumed the administration, their numbers had become so great, or the temptation of profit was so powerful, that the old rule was abandoned, and the poor emancipados were sold to the highest bidder. The regular price obtained, as I have been assured on good authority, was from three to six ounces of gold for women, and from six to ten ounces for men; and these prices having acquired a certain fixed character, although low when compared with the value of the contraband article, it was found to be at once a saving of time, and a source of patronage to the captain-general, to transfer them in masses to some favoured individual, who derived a handsome profit by disposing of them in detail. These particulars would no longer have any present interest, and might be consigned to the care of the historian, if it were not for the fact that the same monstrous abuse of the word 'emancipation' prevails to this day at Rio de Janeiro, where the so-called apprenticeship is made to extend to fourteen years in place of seven. It would be still better for the poor emancipado if his apprenticeship were made to extend to the term of his natural life; or, as the Texans manage it, to the more definite period of 100 years; as in either case his master would not have the same interest in working him to death prematurely."

Besides the hint here thrown out of the expediency of our vessels watching the African shores rather than extending their services to the thousands of miles of the importing coasts; Mr. Turnbull's grand remedy for the diminution or abolition of the slave-trade in these quarters is by extending the powers of the mixed commission court at the Havana; and he invokes Lord Clarendon to undertake and press this important change on the Spanish government. But we must hasten towards our conclusion, which we do with two quotations, which, besides conveying much information, refer to questions of high interest at this time, when an African expedition is preparing, and Mr. Buxton's statements stand among the foremost grounds for its direction and guidance:—

"The remedial measures proposed by Mr. Buxton in his second and more recent work on the African slave-trade, are much better reasoned than his previous estimate of the magnitude of the evil he undertakes to cure. Undoubtedly no effort should be spared to raise the

moral and intellectual standard of the people of Africa, at the same time that we strive to abolish the traffic of which the mass are the passive objects, but in which not a few of them participate as guilty actors. We cannot too soon begin that course of education recommended by the traveller Burckhardt, who proposed the formation of a sort of normal school, in which native Africans should be taught to educate their countrymen in the virtues of Christianity and the arts of civilisation. There can be no reason for waiting till the slave-trade is put down before this course of education is attempted. At the best it is to be feared that a whole generation must pass away before any great or sensible result can be expected from it. The practice of manstealing is so deeply rooted in the habits of millions and tens of millions of people, that we cannot expect it to be so promptly eradicated as, in the freshness of his enthusiasm, Mr. Buxton appears to suppose. The model farms recommended may also be of service. But what are the products to be raised on these farms? Is it an increased supply of food for the consumption of the inhabitants; or sugar, coffee, cotton, or tobacco, with which to purchase those foreign luxuries to which they have been accustomed? This last is an intelligible, and, I would fain hope, a practicable improvement. But surely we are not to postpone the suppression of the trade until a whole continent of savages have settled down to sober habits of laborious industry. By all means revive the African Institution—by all means establish an African Agricultural Association; but do not imagine that the modern Polyphemus can be crushed by efforts so feeble and inadequate. Can we reasonably expect that any addition which the British government may be disposed to make to the naval force on the African station can ever be great enough to operate as an effective blockade of a whole continent? Not so long certainly as those who engage in the contraband trade have the prospect of cent-per-cent profit on their criminal speculations, together with every facility of insuring a somewhat smaller return, if they are only willing to pay the premium. It must not be forgotten that the Spanish and Brazilian planters can probably afford as much as \$800 or \$1000 for their slaves; since even larger prices are obtained in the market of New Orleans. It is only by the effect of competition that the average is kept down to \$300 or \$320 in the barracoons at the Havana. It is to be lamented that the negotiation with Spain in 1827 for the entire cession of the island of Fernando Po, in property and sovereignty, was not attended with success. From its admirable position near the mouths of the Niger and the notorious Bights of Benin and Biafra, it was of all other places the best suited, on the whole coast of Africa, to become the head-quarters of the force for the suppression of the slave-trade, the chief seat of the courts of mixed commission, and the *dépôt* for the liberated Africans. The confluence of the Tchadda with the Quorra is also a favourable point for a European settlement in the interior. In fact, the whole of Mr. Buxton's remedial suggestions appear to me to deserve the consideration and adoption of the British government and the British people, to whom they are respectively addressed. Both branches of Mr. Buxton's 'Remedy' are nevertheless exposed to very serious deductions. The cure of a leprosy with which a whole continent has been tainted, for a period beyond the reach of history or tradition, is a process far too slow to meet the demands of outraged humanity. The

increase of the naval force, the use of armed steamers, the employment of black seamen, and the establishment of twenty such posts as that proposed at Fernando Po, are only so many topical applications for the cure of a deep-rooted constitutional disease. I have not been able to concur with Mr. Buxton, either as to the number of the victims to the slave-trade, or the price paid for the slaves on the coast. We are, nevertheless, pretty nearly agreed as to the amount of the capital involved in the traffic, and the consequent temptation which the princes and other slave-dealers on the coast, or in the interior of Africa, would have to overcome in renouncing it. Mr. Buxton assumes that the number of the victims amounts to an annual average of at least 250,000, and that the average price is not more than 4*l.* a-head; which would make the total gain amount to a million sterling, without including the first cost of those who perish at sea. According to my view of the matter, there are two errors in this estimate, which pretty nearly compensate each other; the unit price being as much too low, as the gross numbers are exaggerated. It will thus be much more difficult than Mr. Buxton supposes, to induce the native Africans to create the means of procuring the foreign luxuries they desire, by turning their attention to honest industry, instead of entrapping their fellow-creatures and selling them to the white ruffians who approach their shores. The compensatory difference is fully three to one. According to my estimate, a negro on the coast would very nearly purchase a pipe of rum; whereas, according to Mr. Buxton, the value of three men would scarcely be equal to that of the like quantity of spirit. In proportion to the comparative facility of stealing over labour, will be the difficulty of introducing the substitute. I have elsewhere shewn that the agents of the Pernambuco Slave Company paid as much as 100 bars a-head for the slaves they obtained at Benin and Gotto; and as, in this depreciated money of account, the bar or dollar was reduced to the par of 3*s.* 1*d.*, the price of the slave in sterling money is proved to have been 15*l.* 12*s.* 6*d.* The proposals of Mr. Buxton are no doubt all excellent in their way; but where they point to a radical cure they are slow; where they suggest improved means of repression they will be found inefficient in their operation. But if you could make the ultimate proprietor of the imported slave insecure in his right to his illicit acquisition, not only could he no longer afford to pay a high price for the contraband article, but he would be compelled to treat the slaves he already possesses more humanely. The existing laws of Spain, and probably those also of Brazil, are sufficient for the purpose. It is only necessary to confer the necessary power on the courts of mixed commission, to insure their rigorous and faithful administration. The whole groundwork of the trade would thus be cut away; the demand would instantly cease; and with the cessation of demand in Cuba, Porto Rico, and Brazil, the corresponding supply, and the fruitful source of crime for procuring it, first on the coast, and afterwards in the interior of Africa, would successively and promptly be dried up and abated."

This single quotation involves the essence of the volume; which we close with one other illustration of general interest:—

"The mortality among the slaves on the sugar plantations in the island of Cuba, enormous as it is, appears, after all, to be only half as great as that which prevails in Egypt, un-

less my friend Dr. Bowring has been led into error in the statement he has made to Mr. Buxton, as quoted by him in his late work on the African slave-trade. 'I have heard it estimated,' Dr. Bowring observes, 'that five or six years are sufficient to sweep away a generation of them, at the end of which time the whole has to be replenished. This is one of the causes of their low market value. When they marry, their descendants seldom live; in fact, the laws of nature seem to repel the establishment of hereditary slavery.' This last is a very beautiful idea; but I do not see that it can be supported by facts. The negro population of the British West Indies not only maintained itself at the full amount at which it was left on the abolition of the slave-trade, but since that period its numbers have materially increased, and there is nothing in the appearance of their descendants to support Dr. Bowring's opinion. The remarkable increase of the numbers of the negro race, retained in slavery in the southern states of the North American Union, is unhappily still more conclusive against the truth of the theory, that the laws of nature repel the establishment of hereditary bondage. To believe in this doctrine would be to relax our efforts in the cause, which bids us exclaim, in language applied to a different species of dominion, '*Obvrat istud male partum, male retentum, male gestum imperium!*' And it is for this reason alone that I venture to point out the fallacy which it seems to me to contain."

*Trip to the Far West.* By Baker Peter Smith. 12mo, pp. 192. London, 1840. Sherwood and Co.

EVERY thing in the world is relative. At New York, the *far West* would be understood to mean a few thousand miles off, amid interminable prairies, swamps, forests, and rocky mountains. About Wapping, Whitechapel, Bishopsgate Street, and Mile End, the *far West* would be understood to mean Berkeley or Portman Square, the Parks, and, perhaps, even Tavistock Square and Bloomsbury. Our author's view of the longitude steers a middle course: his *far West* is the county of Cornwall.

In our last *Gazette* it was our task to point out the striking beauties of a local historian, the famous Mr. Wake, of Southwoldian memory; and years ago we had also the pleasure of paying our grateful *devoirs* to the lord-mayor's inimitable voyage up the Thames, as described by the unparalleled pen of his reverend chaplain, Mr. (since Dr.) Dillon. It is now our happy lot, and we embrace it with ardour, to pay similar honours to a traveller, who, undeterred by the perils on his path,—unterrified by the horrors which beset his journey by night as well as by day,—regardless of privations and fatigue,—and anxious only to make his discoveries in these distant regions agreeable, useful, and profitable to his fellow-creatures—the poor ignorant home-stayers of his race—has undertaken and performed this remarkable *Trip*, and given us an account of it which must hand down his name with glory to the latest posterity, so long as the English is a living tongue or a dead language. With joy, though almost fainting under the importance of the design, we proceed to weave his immortal chaplet, and twine the first laurel round his brilliant brow.

Pass we the gallant dedication "to Mrs. Hearle, of Tregony, and the rest of the Cornish Ladies," and come to the preface, which sets out with very delightful information. It tells us that

"The following pages contain the Journal of

a Trip to Falmouth by water; and of a *pedestrian* excursion through various parts of Cornwall. I have made a few cursory observations on the Royal Adelaide, Dublin steamer, in which I voyaged; and on some of the most interesting places which I saw during the passage. The description of such places as I visited in the county of Cornwall is offered in the order in which they fell under my notice, in three distinct routes;—my first route was performed in one day, and the distance was but thirty-three miles;—from Falmouth to Treigny (via Filley and Ruan Lanihorne), thence to Truro, Penryn, and Falmouth. The second route occupied three days, and the distance was about seventy miles;—from Falmouth to Penryn, Helston, Marazion (or Market Jew), Penzance, Sennen, St. Levan, St. Burian, Mount St. Michael, Breage, Wheal Vor, Helston, Penryn, and Falmouth. The third route occupied two days, and the distance was forty-seven miles;—from Falmouth to Pendennis Castle, St. Mawes, Treigny, St. Austell, Cardaze, St. Blazey, Lostwithiel, Liskeard, and Lannoeaton."

Thus it will appear that Mr. Baker Smith actually traversed a hundred and fifty miles of this difficult and almost impenetrable country within the short space of six days—a bare week—and, oh Heavens! when time is rightly employed, how much may be seen and done in one little week! Yet, with a modesty becoming the accomplisher of so mighty a work—that modesty which is the surest test of greatness of mind—he says, with poetical sweetness and simplicity:—

"This volume assumes nothing beyond the character of a journal, but that journal is genuine; and, albeit I visited not many places in this metalliferous region, I nevertheless traversed the integrity of its greatest length, from west to east, a distance of eighty miles;—from Land's End, where the mighty waters of the united channels dash, with awful roar, against stupendous rocks, to the noiseless stream of peaceful Tamer, whose *Naiads*, innocuous and unharmed, *sedulous to please him, perform their mystic dance in the mists of eve, and make the banks echo, at the grey dawn of coming day, with their songs, on the rival beauties and surrounding charms of Cornwall and of Devon.*"

To have seen all this and more, what a deal must have been seen! and to have listened to these songs (would they were set to music, what would then become of Lover's exquisite "Fairy Legends?"), how must we envy Mr. Baker Smith, of Ina Grove, Camberwell! But he continues:—

"To describe, with accuracy, the wonderful works of Providence, or the surprising accomplishments effected by the *opereuse exertions* and consummate skill of industrious miners and bold adventurers, from generation to generation, for *countless centuries of years*, transcends my limited capacity; I have, nevertheless, endeavoured to give an intelligible account of both subjects, in the confident expectation that the intrinsic interest of the matter, and the indulgence of the reader, will procure the gracious reception of these pages. I have offered remarks concerning the soil of Cornwall, and the face of that county, qualified to remove the erroneous, but rife impression, that the whole region is barren, and that every part is naked of arboreal adornment. I have also glanced at certain peculiarities in Cornish agriculture, and implements of husbandry, with which the courteous reader may be pleased. Lastly, I feel ineffable satisfaction in stating, that much as I was amazed and gratified by the beautiful and wonderful places I visited, and the works of art

which I surveyed, there was yet one subject of surpassing interest, one source of predominant delight. Whether it was their personal beauty or their graceful manners,—their frank expression or sweet simplicity,—what qualities they were which won my admiration, I might find it hard to determine, and useless to speculate upon; but one thing I know, that I left Cornwall, charmed with that magnificent region; and still more enamoured with the beauty and comeliness, the manners and piety, of

"THE CORNISH LADIES;—

"GOD BLESS THEM!"

Amen! say we, those who live among them included; be they of blood Saxon or Phœnician, Danish or Celtic, British or Welsh, English, Scotch, or Irish, dark or fair, tall or short, plump or thin,—bless them all to the very Land's End, and not forgetting the Islands of Scilly!

It is charming to contemplate the peaceful scene from which our traveller started on this awful expedition:—

"It was," he tenderly announces, "upwards of five years since I had taken possession of my little place in Surrey (during which time I had not slept one night from under my roof), when I resolved to indulge myself in a few days' *vacuity* from business, and visit some *hitherto unseen region* of my native land."

Such is the thirst for knowledge in the human breast,—such the ambition to distinguish oneself by extraordinary deeds! Not all the soft endearments of Ina Grove, Camberwell, could prevail; and the desperate resolution to visit the *autres vast and deserts* idle about Truro was taken. What were the sufferings on the way, when in the Adelaide steamer off the furious coast of Dorsetshire, it is told,—

"Night came again upon us, and the wind again rose high, and the sea again began to swell. We were up and down, rolling and knocking about; so that it was difficult to walk the deck. I could stand it no longer; and, descending to the grand cabin, ordered the steward to prepare an infusion of the Chinese tea-leaf. I ate heartily of toast and butter, and drank freely of the grateful beverage, without the ordinary saccharine and lactic appendages: hereupon I retired to my berth, and passed the second night."

Or what (we ask again) the greater risks by land, such as descending the Wheal Vor mine, where the author relates,—

"Mr. Hodge perfected his friendliness by presenting me with specimens of ore, washed and calcined powders, and pure tin; which I have placed in the museum at my little place in Surrey: the sight of which, I hope, will continually remind me of his urbane attention. Taking leave of this gentleman, I retired from this *didactic* and interesting scene, pondering on what I had beheld; the space occupied above—the depth attained below—the powerful engines exercised—the number of human beings employed—the variety of processes—the elements brought to operate. *Lofty courage had dared, and Herculean toil had accomplished, the opereuse undertaking of diving 240 fathoms into the bowels of the earth.*"

How undaunted the man who could brave all these! the sea, perhaps, compensated by the toast and butter,—but the descent into the mine: let Virgil write of his *pious Æneas*,—a miserable adventurer when compared to our Baker Smith. There is, nevertheless, a considerable resemblance between the hero of the

"*Æneid*" and our hero. There are the voyages, the Didos, the descent into the infernal regions below the hollow crust of the globe! The journal of the voyage is full of delicious and instructive remarks: for example, we are informed that Greenwich Hospital was "the palace of several of our monarchs in olden times; and now an asylum for wounded and decayed sailors, a retreat for their widows, and a school for their orbated offspring."

Of the Isle of Wight, Mr. Smith "observed, within a few hundred yards of the end of this coast, that now presented a rocky cliff, a portion which was singularly attractive by its colorific diversity; all the colours of the rainbow seeming to be displayed on that section of the rock. It was noticed by my fellow-passengers, and the captain expressed his opinion that it was occasioned by mineral substance."

At Plymouth:—"On an island stands the citadel [it does not, but on the main land], a fort of great strength, which dominates the port and the circumjacent localities."

The philosophy of light, developed in our next extract, outshines Sir David Brewster, Professor Baden Powell, Lieut. Drummond, Bude per Gurney, and Sir Frederick Trench. "Eddystone light-house (says our author) is about fifteen miles to the south-west of Plymouth breakwater; but, *night coming on, I did not observe it.*" Solve this wonderful phenomenon who can. How different from Shakspeare's notion of a light being most visible by night:—

"How far this little candle throws its light!  
So shines a good deed in a naughty world."

But the voyage must end: behold us at Falmouth, where the wearied Baker pathetically exclaims,—

"I now lay down, for the first time in my life, at a distance of 270 miles from my native city. No continual sleep could I get; a constant motion appeared to rock me,—resulting, no doubt, from the effect of the voyage. I do not remember to have passed a much more tedious night, and I was the more chagrined, as I wanted a good night's rest; the next day being the longest day's walk which I should have to perform during my stay in the country,—namely, above thirty-three miles."

The memorabilia of this exploit offer a few extracts:—

"The road and hedges, for about two miles beyond Mylor, were made principally of a *pretty spar*."

"I saw a splendid rainbow over the town. The radiant, colorific arch of Jehovah painted the vault of heaven; and, based on fathomless profundity, spanning visible creation, from east to west, threw its immeasurable grasp over the wide face of nature."

"On *expressing* Penryn, I found the country sterile;" and, "About three miles from Penryn, I first saw some beautiful goats browsing at large,—a sight worth beholding! some being covered with long hair, white as snow and fine as silk."

"Where a herd of goats love to skip from rock to rock, and browse on the wild flowers which nature has scattered on the barren heath,—there, far beneath the ken of mortal glance, and undisturbed by the earlier generations of untutored antiquity, lie rich lodes of valuable tin and copper."

We give these extracts without comment, for they speak alike for themselves and the genius of their author. We leave the wonders of the Land's End untold, though they are so curious that Mr. Smith sublimely says,—

"*Regretting that I could not spend a day at*

two in surveying the *multicausal* curiosities of this region, I unwillingly withdrew from the majestic and interesting scene; but I retired from it much gratified, and more than ever impressed with the *mighty works of creative energy*. The local sublimity of the Land's End affords a commanding view of oceanic expanse; and the colossal columns of rock give an awful effect to the stupendous vision; whilst, added to those grave and elevating sentiments, consequent on so grand a sight, the sense of hearing also acts upon the mind: by the distant roar of the angry sea ascending from the caverns below, and the screaming of the Cornish chough, assailing you from above, and on every side, or faintly heard in the distance, on the dying breath of the autumnal breeze. *The entranced spectator has no election*; but is engrossed with admiration of that Great Power, by the fiat of whose mere volition, nature's chaos was thus *harmonised*, and stamped with the glorifying impress of multiplicitous beauty. Reader! if you would think lowly of yourself, go whither you may cast your eye on spaulless ocean, where great and lofty vessels plough the deep, and look but puny things, although they really are in bulk as huge as

‘That sea-beast  
Leviathan, which God of all his works  
Created hugest that swim the ocean stream.’

The Far West was the scene of the pious John Wesley's ministerial labours;—that *celebrated* and exalted character, who, by his holy life, and persevering toil, evangelised the Far West.

“The eastern promontory of this little bay is that on which the *Logan (or Rocking) stone*

stands, and is a stupendous granitic rock, running half a furlong into the sea, on whose extremity stand four magnitudinous masses, with interstitial spaces.

In some places you have to tread a narrow way, having on one side a precipice, and on the other a perpendicular wall, allowing scarcely room to pass; and, far beneath, you hear the *multicausal* base of the promontory reverberate, with hoarse clamour, the loud strokes of the furious billows; whilst the rolling waves, in constant succession, dash against the circumjacent rocks, and their sound, mingling with the din beneath, continually ascends in a terrific, and awfully tumultuous roar.”

Penzance, Monnt's Bay, and the Mount, are also magnificently described;—Stanfield's glorious picture is but feeble in comparison:—

“I again (says our author) took water at the pier, and, crossing the interstitial portion of the bay, debarked in safety. I could not help gazing at the mount, and admiring its singular beauty and romantic circumstance. A stupendous isolated mount of granitic rock, partially covered with verdure, rising in a fearful steep, and crowned with a castle; *this viduated mount*, the melancholy remains of a forest tract, now under oceanic dominion.”

“The screaming gull and the Cornish chough may haunt the Hoary Rock, but where no trees give shelter from the storm, or afford *nidifactory accommodation*, the ear is rarely gratified with the wild, untutored melody of the lovely feathered warblers. I saw some fine rabbits.”

The Ecolaoebion would be useful hereabouts; but Mr. Smith's references to the antiquities of this spot tear us from titillarian thoughts:—

“The history of this mountain's *earliest ignitines*, anterior to the days of the Royal Consecrator, has for centuries been matter of anti-

quarian research; but, illuminated only by the feeble rays of unauthenticated legends and conflicting traditions, remain shrouded in the shades of undispelled obscurity. The records of modern history, however, state, that Edward founded here a priory of Benedictine monks;—that the disturbance to which the holy brotherhood were subjected, in troublous times, by factious leaders desiring the possession of so secure a fastness, caused the mount to be fortified; but that Henry of Pomeroy treacherously seized it, when Richard Cœur de Lion was held captive in Germany, on his return from the *Palesinal crusade*.”

Retiring from the Mount, our energetic traveller refreshed tired nature by breakfasting; and he informs us, “I had four sorts of fish placed before me,—marinated pilchards, broiled pilchard, and pullock, and hake steak. The hake steak is a cross slice of the hake fish (whose external appearance is somewhat like salmon), fried, I think, in oil; a custom, I apprehend, of Judaic origin. . . . The day advesperated, ere I left the churchyard of Tregony. . . . The road from Liskeard to Launceston, being a cross road and lonely, I had to thank my stars on this occasion; for the moon was much obscured, and had it not been for the magnitudinous luminaries composing *Ursus Major*, I should not probably have reached Launceston that night.”

“The pure metal, now liquidated by fervent heat, and glowing in the furnace, is poured into iron moulds, two feet long, and one foot wide at top, and lessening at bottom, and eight inches deep: this done, behold a

#### BLOCK OF TIN!

bright, pure, valuable, and universally esteemed throughout the known world,—*like a*

#### CORNISH LADY!

These blocks of tin, weighing three cwt. and a half, are principally sent into Wales. Small bars are cast in marble moulds, half a yard long, and half an inch thick and wide, for the foreign market, and for the home consumption of plumbers and others; who, with lead and resin, make therewith metallic cement, well known by the name of *soder*.”

So the Cornish ladies weigh three cwt. and a half,—pretty heavy on hand, even “for home consumption.” But still they must be the metal most attractive.

Our author's historical notices are wonderfully rich, except, perhaps, in the case of *Richborough*, which he calls *Reisborough Castle*; but we have not time to point out their beauties, and conclude our extracts with one other specimen:—

*Cornubial and Connubial*.—“I engaged two sailors to go to the south-eastern extremity of the rocks of Pendennis Castle, and be ready to transport me across Falmouth Harbour to the Borough of St. Mawes; and, bidding adieu to the first town in my lady's native county, on which I had set foot, I ascended the steep and romantic road.”

Happily back, we trust, and no longer a truant among the “Cornish ladies” from the lawful partner of Ina Cottage, the little place in Surrey, may we not congratulate our modern Gulliver on his safe return? It has been thought that there was some difficulty in distinguishing from each other the few individuals who bore the envied name of Smith; and we rejoice that, in this one instance at least, it may be surmounted. We are informed in the best of books, that the Wise Men came from the East; henceforth, then, let Baker be known among all his fellow-men as

*The Far-West Smith.*

*The Pathfinder; or, the Inland Sea.* By J. F. Cooper, Esq. author of “The Pilot,” &c. 3 vols. 12mo. London, 1840. Bentley.

MR. COOPER, in this Romance, occupies two grounds (if we may say so when one of them is water), on which he has, as a writer, been most successful. As in “The Last of the Mohicans,” he has the wild forest of America wherein to roam; and, as in “The Pilot,” he has the water and shipping; though, instead of the open sea, it is the inland Lake Ontario, and only two small vessels and boats, instead of men-of-war and fleets.

The *dramatis personæ* are few, and several of them revivals of characters in preceding works: and the events of the story are rather meagre for three portly volumes. Mabel Dunham, the heroine, accompanied by her uncle Cap, a genuine sailor, and a male and female Indian, Arrowhead and the Dew of June (Tuscaroras), cross the country to join Sergeant Dunham, the father of Mabel, at a fort on Ontario. They are met by the Pathfinder, a guide and unerring marksman, Jasper Eaudouce, a young, expert, and gallant river-and-lake-navigator; and a Mohican chief, the Serpent,—who have been sent from the fort to conduct them in safety thither. They are assailed by hostile Iroquois and Mingos; and the first volume is occupied with their stratagems and struggles till they reach the fort. The second, after abiding there a little, giving an account of a rifle shooting match, and describing the love for Mabel of Lieutenant and Quartermaster Muir, a Scotchman, despatches the sergeant in command of an expedition to the Thousand Isles (accompanied by all hands); and is filled up with a contest in naval skill between Cap and Eaudouce, which, especially after the lengthy details of the dangers of river falls and Mingo ambuscades, &c., might as well have been discussed in a fifth part of the space. Indeed, this is the defect of the work; for though the characters are well contrasted, their discussions, each in support of his own profession and prejudices, become tedious from repetition of the same opinions, and always tending to the same end. The third volume relates to a horrible Indian warfare on one of the Thousand Isles, where scalps are torn from reeking skulls and all the atrocities of savage butchery appal the mind of the reader. In parts most improbable, as when Mabel defends a block-house alone for eight-and-forty hours against the force of hostile Redskins who had murdered the others before her eyes, this portion of the romance is written with great spirit, and the catastrophe is wrought out in an impressive and interesting manner. We will not divulge the secret of the traitor, but we protest against it as being meant rather to surprise us than to rest on likelihood or almost possibility. But as Mr. Cooper has chosen to create his man, we must let him use him as he pleases.

Having said thus much of the general character of *The Pathfinder*, we select, as an example of the work, a section of one of the colloquies between Cap and the Pathfinder, which exhibits sufficiently the contrasting of persons to which we have alluded:—

“As Mabel could not very plausibly set up this extravagant opinion, Cap pursued the subject, his countenance beginning to discover the triumph of a successful disputant. ‘And then them trees bear no comparison to these trees. The coasts of the ocean have farms, and cities, and country-seats, and, in some parts of the world, castles, and monasteries, and light-houses—ay, ay, lighthouses in particular, on

them; not one of all which things is to be seen here. No, no, Master Pathfinder; I never heard of an ocean that hadn't more or less lighthouses on it; whereas, hereaway, there is not even a beacon.' 'There is what is better—there is what is better; a forest and noble trees, a fit temple of God.' 'Ay, your forest may do for a lake; but of what use would an ocean be if the earth all around it were forest? Ships would be unnecessary, as timber might be floated in rafts, and there would be an end of trade; and what would a world be without trade? I am of that philosopher's opinion, who says human nature was invented for the purposes of trade. Magnet, I am astonished that you should think this water even looks like sea-water! Now, I dare say, that there isn't such a thing as a whale in all your lake, Master Pathfinder?' 'I never heard of one, I will confess; but I am no judge of animals that live in the water, unless it be the fishes of the rivers and the brooks.' 'Nor a grampus, nor a porpoise even? not so much as a poor devil of a shark?' 'I will not take it on myself to say there is either. My gifts are not in that way, I tell you, Master Cap.' 'Nor herring, nor albatross, nor flying-fish?' continued Cap, 'who kept his eye fastened on the guide, in order to see how far he might venture. 'No such thing as a fish that can fly, I dare say?' 'A fish that can fly! Master Cap—Master Cap, do not think, because we are mere borderers, that we have no ideas of natur', and what she has been pleased to do. I know there are squirrels that can fly—' 'A squirrel fly! the devil, Master Pathfinder. Do you suppose that you have got a boy on his first v'y'ge up here among you?' 'I know nothing of your v'y'ges, Master Cap, though I suppose them to have been many; but as for what belongs to natur' in the woods, what I have seen I may tell, and not fear the face of man.' 'And do you wish me to understand that you have seen a squirrel fly?' 'If you wish to understand the power of God, Master Cap, you will do well to believe that, and many other things of a like natur', for you may be quite certain it is true.' 'And yet, Pathfinder,' said Mabel, looking so prettily and sweetly even while she played with the guide's infirmity, that he forgave her in his heart, 'you who speak so reverently of the power of the Deity appear to doubt that a fish can fly.' 'I have not said it—I have not said it; and if Master Cap is ready to testify to the fact, unlikely as it seems, I am willing to try to think it true. I think it every man's duty to believe in the power of God, however difficult it may be.' 'And why isn't my fish as likely to have wings as your squirrel?' demanded Cap, with more logic than was his wont. 'That fishes do and can fly, is as true as it is reasonable.' 'Nay, that is the only difficulty in believing the story,' rejoined the guide. 'It seems unreasonable to give an animal that lives in the water wings, which seemingly can be of no use to it.' 'And do you suppose that the fishes are such asses as to fly about under water, when they are once fairly fitted out with wings?' 'Nay, I know nothing of the matter; but that fish should fly in the air seems more contrary to natur' still, than that they should fly in their own element—that in which they were born and brought up, as one might say.' 'So much for contracted ideas, Magnet. The fish fly out of water to run away from their enemies in the water; and there you see not only the fact, but the reason for it.' 'Then I suppose it must be true,' said the guide, quietly.

'How long are their flights?' 'Not quite as far as those of pigeons, perhaps; but far enough to make an offing. As for those squirrels of yours, we'll say no more about them, friend Pathfinder, as I suppose they were mentioned just as a make-weight to the fish in favour of the woods. But what is this thing anchored here under the hill?' 'That is the cutter of Jasper, uncle,' said Mabel, hurriedly; 'and a very pretty vessel I think it is. Its name, too, is the 'Scud.' 'Ay, it will do well enough for a lake, perhaps, but it's no great affair. The lad has got a standing bowsprit, and whoever saw a cutter with a standing bowsprit before?' 'But may there not be some good reason for it, on a lake like this, uncle?' 'Sure enough. I must remember this is not the ocean, though it does look so much like it.'"

The officers of the Scotch regiment, the 55th, in the fort, are sketched in an amusing way—for instance, when Lieut. Muir endeavours to engage his commander to favour his suit for Mabel:—

"A middle-aged man, in the dress of an officer, but whose uniform wanted the usual smartness of the profession, made his appearance, and was saluted as 'Mr. Muir.' 'I have come, sir, at your bidding, to know my fortune,' said the quarter-master, in a strong Scotch accent, as soon as he had taken the seat which was proffered to him. 'To say the truth to you, Major Duncan, this girl is making as much havoc in the garrison, as the French did before Ty; I never witnessed so general a route in so short a time!' 'Surely, Davy, you don't mean to persuade me that your young and unsophisticated heart is in such a flame, after one week's ignition? Why, man, this is worse than the affair in Scotland, where it was said the heat within was so intense that it just burnt a hole through your own precious body, and left a place for all the lassies to peer in at, to see what the combustible material was worth.' 'Ye'll have your own way, Major Duncan; and your father and mother would have theirs before ye, even if the enemy were in the camp. I see nothing so extraordinary in young people following the bent of their inclinations and wishes.' 'But you've followed yours so often, Davy, that I should think by this time it had lost the edge of novelty. Including that informal affair in Scotland, when you were a lad, you've been married four times already.' 'Only three, major, as I hope to get another wife. I've not yet had my number: no, no; only three.' 'I'm thinking, Davy, you don't include the first affair, I mentioned; that in which there was no parson.' 'And why should I, major? The courts decided that it was no marriage; and what more could a man want? The woman took advantage of a slight amorous propensity, that may be a weakness in my disposition, perhaps; and inveigled me into a contract that was found to be illegal.' 'If I remember right, Muir, there were thought to be two sides to that question, in the time of it?' 'It would be but an indifferent question, my dear major, that hadn't two sides to it; and I've known many that had three. But the poor woman's dead, and there was no issue; so nothing came of it after all. Then, I was particularly unfortunate with my second wife,—I say second, major, out of deference to you, and on the mere supposition that the first was a marriage at all; but first or second, I was particularly unfortunate with Jeannie Graham, who died in the first lustrum, leaving neither chick nor chiel behind her. I do think,

if Jeannie had survived, I never should have turned my thoughts towards another wife.' 'But as she did not, you married twice after her death; and are desirous of doing so a third time?' 'The truth can never justly be gained, Major Duncan, and I am always ready to avow it. I'm thinking, Lundie, you are melancholar' this fine evening?' 'No, Muir, not melancholy absolutely; but a little thoughtful, I confess. I was looking back to my boyish days, when I, the laird's son, and you, the parson's, roamed about our native hills, happy and careless boys, taking little heed to the future; and then have followed some thoughts, that may be a little painful, concerning that future, as it has turned out to be.' 'Surely, Lundie, ye do not complain of ye'r portion of it. You've risen to be a major, and will soon be a lieutenant-colonel, if letters tell the truth, while I am just one step higher than when your honoured father gave me my first commission, and a poor devil of a quarter-master.' 'And the four wives?' 'Three, Lundie,—three only that were legal, even under our own liberal and sanctified laws.' 'Well, then, let it be three. Ye know, Davy,' said Major Duncan, insensibly dropping into the pronunciation and dialect of his youth, as is much the practice with educated Scotchmen, as they warm with a subject that comes near the heart:—'ye know, Davy, that my own choice has long been made, and in how anxious and hope-wearied a manner I've waited for that happy hour when I can call the woman I've so long loved a wife; and here have you, without fortune, name, birth, or merit; I mean particular merit.' 'Na, na; dinna say that, Lundie. The Muirs are of gude bluid.' 'Well, then, without aught but bluid, ye've wived four times.' 'I tell ye, but thrice, Lundie. Ye'll weaken auld friendship if ye call it four.' 'Put it at ye'r own number, Davy; and it's far more than ye'r share. Our lives have been very different on the score of matrimony, at least; you must allow that, my old friend.' 'And which do you think has been the gainer, major, speaking as frankly the'gither as we did when lads?' 'Nay, I've nothing to conceal. My days have passed in hope deferred, while yours have passed in—' 'Not in hope realised. I give you mine honour, Major Duncan,' interrupted the quarter-master. 'Each new experiment I have thought might prove an advantage; but disappointment seems the lot of man. Ah! this is a vain world of ours, Lundie, it must be owned; and in nothing vainer than in matrimony.' 'And yet you are ready to put your neck into the noose for the fifth time?' 'I desire to say, it will be but the fourth, Major Duncan!' said the quarter-master, positively; then, instantly changing the expression of his face to one of boyish rapture, he added:—'But this Mabel Dunham is a *rara avis*! Our Scotch lassies are fair and pleasant; but it must be owned, these colonials are of surpassing comeliness.' 'You will do well to recollect your commission and blood, Davy. I believe all four of your wives—' 'I wish, my dear Lundie, ye'd be more accurate in ye'r arithmetic. Three times one make three.' 'All three, then, were what might be termed gentlewomen?' 'That's just it, major. Three were gentlewomen, as you say, and the connexions were suitable.' 'And the fourth being the daughter of my father's gardener, the connexion was unsuitable. But have you no fear that marrying the child of a non-commissioned officer, who is in the same corps with yourself, will have the effect to lessen your consequence in the regiment?'

'That's just been my weakness through life, Major Duncan; for I've always married without regard to consequences. Every man has his besetting sin, and matrimony, I fear, is mine. And, now that we have discussed what may be called the principles of the connexion, I will just ask, if you did me the favour to speak to the sergeant on the trifling affair?'

These extracts are all that need be given from an author so popular as Mr. Cooper; and it is with pleasure we add, that in exhibiting so much the prejudices of others, Mr. Cooper has, on this occasion, displayed very little of his own. That he could not entirely escape from it, however, the following from among three or four slight touches will serve to show:—

"Pathfinder's disposition to think well of the Delawares, and to think ill of the Mingos, must by this time be very apparent to the reader. Of the veracity of the former he entertained the highest respect, while of the latter he thought, as the more observant and intelligent classes of this country are getting pretty generally to think of certain scribblers among ourselves, who are known to have been so long in the habits of mendacity, that it is thought they can no longer tell the truth, even when they seriously make the effort."

*Travels in Koordistan, Mesopotamia, &c. By J. Baillie Fraser, Esq. author of "The Kuzilbash," "A Winter's Journey to Persia," &c. 2 vols. 8vo. London, 1840. Bentley.* THOUGH we have of late years been made much better acquainted with the countries of Asia than during any previous period, and though the author himself has contributed not a little to that knowledge, yet is the present publication a very agreeable one. Mr. Fraser, in 1834-35, visited parts of Koordistan and Mesopotamia hitherto untrudged, or at least undescribed, by any European traveller; and his lively manner of sketching "the character and manners of the Koordish and Arab tribes" by whom they are possessed, is so pleasing, that even had he been going over familiar routes, the reader would have gone along with him as with a welcome guide and companion. It is true that the lapse of time, and the changes which have taken place in Persia, have detracted from the historical value of the work, and that the publications of more recent travellers have somewhat impaired its novelty. Still, enough remains of originality to recommend it; and it is our duty to select a few extracts to elucidate its leading features.

The author left Tabreez in October 1834, and traversed the land, partly in Koordistan, to Baghdad; thence took a month's tour through ancient Chaldaea, by way of Babylon, &c., among the Montefic Arabs; returned to Baghdad, and through Persia, &c. home. Previous to setting out, he paints the character of the Prince Mahomed Meerza, who soon after succeeded his grandfather on the Persian throne, and his minister, the Kaymookâm, whose influence was paramount over him. As this gentleman was strangled, however, not long after the accession, we shall not be very profuse of our quotations concerning either. The following may suffice:—

"Almost ever since I came here, Mahomed Meerza has been confined with a fit of the gout, and the army is absent on the frontiers of Turkey, and with it most of the officers who would have given glitter and bustle to the court. 'Gout!' you will exclaim,—'a prince of Persia in the gout? what an absurd idea,—what an incongruity!' and so it is, I grant;

for with a prince of Persia, or any Persian, one is apt to associate notions of slenderness and activity, gracefulness and capital horsemanship. The idea of a fat body and swollen legs seems absolutely foreign to the creature. But Mahomed Meerza, although only twenty-eight years of age, is actually a very corpulent young man, and has, from his mother's family, a hereditary taint of gout, which has unhappily been early excited into action by the unlimited indulgence of an excellent appetite, for the most difficult task of his royal highness's medical advisers is to induce him to be temperate in eating. Business, too, prevents him, while living in cities, from taking that extent of exercise which his natural disposition to fullness requires, and thus he is reminded of his excesses, and punished for them, by an occasional sharp fit of gout. But there are other causes which tend to curtail the brilliancy of the prince's court, and of these poverty is one. He has returned from the Khorasan campaign to an empty treasury, and to find the resources of the province, from whence it should be replenished, exhausted and forestalled by the atrocious speculations of his brothers, and certain other individuals in whom his father had placed confidence. Of the former, two, namely, Jehangeer Meerza and Khosroo Meerza, have been sent to well-merited confinement in the fortress of Ardebeel. These young men are both so worthless that their own mother declared it impossible to tell which was the worst. There is a yet more curious reason for the quietness of his court. The whole real power in Azarbaijan is at this moment vested in the person of the prince's prime minister, Meerza Aboul Causim, to whom I have already introduced you under the title of Kaymookâm, and with whom you may remember I had an interview at Muzeenoon. This minister, as he is one of the most prominent, is also one of the strangest characters in all Persia; nor are his manners and appearance less remarkable than his mental qualities. Conceive a man of somewhat more than middle size, exceedingly heavy and corpulent, with much rotundity of paunch, coarse features, small, but very prominent, eyes, so short-sighted as to suggest the idea of purlblindness, yet keen and bright withal; a great ugly mouth, garnished with long, irregular, prominent, yellow fangs, which an hideous, habitual, and stupid gape always exposes to view;—conceive all these, and you will say that they do not compose a very promising exterior; and certainly the external attributes of the Kaymookâm would be more suitable to a stupid village boor, than to the first statesman of an empire. It is true that a good-humoured, yet somewhat sarcastic smile at times brightens up the lower part of his countenance, while the upper features are illumined by a quick glance from his glimmering optics; but, to my apprehension, there is unquestionably nothing in the outward appearance of the Kaymookâm to herald the talent and shrewdness which it is asserted he possesses. Nor are his demeanour and personal habits calculated to impress strangers, Europeans at least, with more favourable ideas of his character and endowments. He can be civil, and even polite, when it suits his purpose, but he can be quite as impertinent and gross; and it requires a strong and steady hand to restrain him, when his devil tempts him to be insolent or abusive. Like many of the Persian great, he is a monstrously foul feeder, and his feats in devouring melons and cucumbers, as commonly related, seem utterly incredible. I have heard, for instance, of his gobbling up seven melons, or fifty

pounds of melons at a sitting, and it is certain that he indulges in this way to such an excess as to be for a time incapable of moving. A gentleman once, in passing over the ground where his excellency had been encamped with a military force, towards the Turkish border, observed a temporary tent formed of some spears stuck in the ground, and covered with a few horse-cloths and great coats. On riding up to see who could be there, he discovered that it was the minister, who, having gorged so much of a favourite sort of melon that he could not move, had been placed by his attendants under this temporary shelter, erected for the purpose, until his excellency should be able to proceed. As a man of business he stands unequalled in public estimation for universal talent. He is an able financier; understands, and, it is asserted, can regulate and command, the resources of the country; is well acquainted with the condition of every province; and none, they say, comes near him in knowledge of foreign relations and management of foreign policy. But that for which he is most celebrated—I had almost said notorious,—is the art of political intrigue, so much admired by Persians, and, more shame to the age, not less encouraged in civilised Europe; the art, in other words, of cheating others—of making them believe what the intriguer desires, however wide of the truth, to serve his own purposes—of deceiving and lying through thick and thin to compass the ends he has in view."

The next prominent person whom we approach is the Meer of Rewandooz; but he also has been since disposed of by a combined Turkish invasion; and so we may let him sleep with his fathers. Of the mountainous region he had converted to independence, a trait or two may, however, be acceptable from the MS. journal of Dr. Ross, quoted by Mr. Fraser:—

"Dumdum is a small fort built upon a precipitous promontory of rock one hundred feet high, insulated by a wall built across the neck, and overlooking a small town of one hundred poor houses, in a perfect jungle of gardens filled with every sort of fruit tree. From this place the town of Rewandooz appeared to consist of about two thousand poor houses, with a sort of fort situated in a hollow of the mountains, on the south bank of the greater Zâb, over which there was a bridge of trees, resting on two stone piers, and covered with branches and earth. The river was narrow, rapid, rough, and deep; but eight hours further down, kellecks (or rafts of skins) can go across. The doctor was not permitted to visit Rewandooz, nor to go much about the country, but among other objects of interest which he heard of, he mentions one in particular,—a pillar of marble standing upon a quadrangular base, in all about three spears (thirty to thirty-five feet) high, and covered with inscriptions. Several Europeans, at different times, had expressed a wish to visit it, but permission was always refused. It was said to be two days' journey from Dumdum, and has been supposed to be a pillar set up by Semiramis. Of Dumdum and its inhabitants, Dr. Ross does not speak with much applause. Of the latter, he says, 'The people appear to know little of the good things of this world. The great folks are miserably dressed, and their houses mere pigstyes. They are sulky savages; they will not give even a draught of milk without growling, and every thing further has almost to be forced from them. When I gave them medicine they grumbled that I did not furnish bottles to put it in.' The dress of the richer men is the same as that of the Baghdadis. The poorer

wear a short jacket, with wide camel trousers, and a felt jerkin without sleeves, cotton shoes, and woollen stockings; and on their head the peculiar Koordish turban. The women wear a blue shirt with wide trousers, tied at the ankles, and a square mantle fastened by two corners hanging down the back. On their head they wear a round plate of silver, from which hang down large drops with a coin fastened to each, round the head and neck, or the whole affair is made of silver coins. The mode of salutation is curious; each takes the other by the right wrist, and kisses the forearm. Every evening six or eight of the villagers dined 'below the salt,' at the Meer's house, and several old warriors, the friends of his youth. Ophthalmia the doctor observed to be frequent here."

A little further on among the Koords, our countryman tried his luck at fishing; and the scene was droll enough:—

"For the Koords were too impatient to endure the slow and quiescent process of luring the fish with the bait. The khan's son, so soon as he saw a shoal of them darting about in the still water, spurred his horse at them, spear in hand, as he would have done at a Bithla or a Kuzilbash, if his foe, shouting out, 'Ah-ah! ah-ah! look at them! look at them!' and chasing them hither and thither as if he could have caught them by speed of foot. Then all the party dashed into the water girth-deep, splashing, and poking, and shouting out to me to look at the fish—to come here or there—here was the place to catch them—here were the large ones. It was in vain to attempt explaining that all my art lay in quietly enticing the fish to feed—that success depended entirely on perfect stillness, and keeping out of sight of the water. There they would all stand or ride along the banks, or sit upon them, striking with their spears at the fish as they darted by, till a hand-net that had been sent for was brought, when I gladly put up my rod and tackle and looked on, laughing at the childish delight with which the Khanzadeh (khan's son) saw each fish that was entangled in the net taken out of the water. Nor was his delight less on the second day, when, the net having failed of success, I found a pool in which they could not ride, and succeeded in hooking and landing several tolerable fish. At length the rod broke, and there was an end of the fishing, but not of the sport; for we next rode across the country after quails and ducks—any thing that afforded an object or excuse for a chase, now and then putting up a grand bustard by way of variety; and I was made acquainted with a curious enough way they have of catching quails, and which I do not remember to have seen described. A man, choosing a place where they abound, spreads a net upon the grass or stubble, in such a manner that the birds can run into but not through it; and then, taking his cloak, he spreads it above his head by means of two sticks, in such a fashion as to double in appearance his natural size and stature. Thus disguised, he goes poking along until he sees a quail upon the ground, when, bending forward, he drives it before him; and the spectrelike hood he carries, overshadowing the creature, so terrifies it, that it does not dare to take wing, but keeps running forward; a movement of the hood to one side or other serves to direct the course of the unfortunate bird, which soon runs right under the net, and is caught. In this odd manner a great many quails are taken, and one may see dozens of men with their cloaks stuck over their heads, in the manner I have described,

employed on a fine evening in the fields at this pastime."

The Koords bear a striking resemblance to the old Scotch Highland clanship; but they have, instead of the bards, a class of men among them of whom we are told:—

"Seyeds, as you know, are the descendants of Mahomet; but they are divided into several classes, some of which enjoy a higher portion of reverence than others, as being possessed of certain attributes derived, as is believed, from their venerated origin. Of these, one, which is only arrogated by some few families, is the power of enduring the action of fire unharmed. At Sonje Bulagh it was said that a family thus endowed resided at a village not far off; but unfortunately, when a desire to witness this miracle was expressed, no one could be produced to perform it. It is asserted, that these gifted persons will go into a sort of oven called a tendour, around which fire is heaped until it is red-hot, and that they will heap fire upon their heads, and yet still call out, 'I am cold!'—and walk out unhurt. They will take a piece of red-hot iron out of the fire without injury to their hands; and in short, if we believe what is said of them, they are fire-proof. To laugh at this absurd fable would have been equally useless and offensive; for, as all such stories, whatever their origin, have been confirmed by the traditional belief of ages, there is no confuting them, except by the test of experiment—a test that is always shunned by the parties professing, where detection is likely to ensue."

Passing forward, Mr. Fraser entered the boundary of ancient Assyria, and we have the following summary of the people:—

"Like other men and nations, they are creatures of circumstance and education, but possessed of natural qualities that might be turned to good account. Bold they are, and hospitable after a fashion: but this last virtue has been sadly dimmed of late years by poverty and oppression. Like most pastoral and patriarchal people, they are distinguished by a strong love of kindred and tribe, which renders them fierce and violent in their quarrels, each adopting the feud which has risen from offence to a clansman, and perpetuating it by a series of remorseless murders. Far from cruel by nature, these feuds, and their fondness for war and warlike occupations, tend to make them reckless of spilling blood, and cause them to hold human life at less account than it is rated at in more peaceful countries; yet their wars are not deadly, and the very consciousness of the interminable consequences of shedding blood operates as a wholesome restraint upon their passions, when mere feelings of pity or a moral sense of crime would be too weak to prevent murder. Such, in fact, is ever the case among semi-barbarous tribes, when no superior and competent power is present to exercise a proper control; and, as I have already hinted, if any one would form a pretty close idea of the Koords, the Toorkmans, or even the Arabs, so far as social intercourse and strife are concerned, let him turn to the condition of our own Scottish highlands some couple of centuries ago. In person the Koords are well-made and active; differing, perhaps, but little essentially from their neighbours the Persians. But the national features are strikingly peculiar. The cast of countenance is sharp, the form of the face oval, the profile remarkable from the prominence of the bones of the nose, and the comparative retrocession of the mouth and chin, which communicate to its outline a semicircular form. The eyes are deep-set, dark, quick, and intelligent; the brow

ample and clear, but somewhat retreating, completing the shape assigned to the profile; and the general mould of the features by far more delicate than those of the Persians, which usually are somewhat too strong. In Koordistan you would look in vain for a snub nose. The *petite nez retroussé* is unknown among them. The mouth is almost always well-formed, and the teeth fine. The hands and fingers small and slender. In short, there is something of elegance about the Koordish form, which would mark them as a handsome nation in any part of the world. The same remarks apply to the women, so far as I have had opportunities of observation. When young, they are exceedingly pretty; but when old, or even at what we should call maturity, the sharp prominence of feature, which characterises them in common with the men, is assuredly unfavourable to beauty, and they soon appear old and withered. I had sufficient opportunities for observing these particulars, as they do not wear veils like the Persian women, the utmost practised in this way being to bring the end of the handkerchief, with which their heads are covered, across their mouths and chins; but I regret that it is little in my power to follow them into their privacy, and describe them in their domestic duties. From what I do know, however, I have reason to believe that their life, duties, and occupations, resemble, in all respects, closely those of the tribes of Persia. The women of the richer classes, living in towns, remain in the harems of their husbands or fathers, and veil when they go abroad. The poorer, and even those of the higher orders, living in villages or tents, perform the same duties as I have described those of the Toorkmans and Eelians to do."

[To be concluded next week.]

*Mary Stuart: an Historical Tragedy.* By James Haynes. 8vo. pp. 103. London, 1840. Ridgway.

HAVING quoted from "The Legend of Florence," it would not be even-handed justice in the *Literary Gazette* to pass its Drury Lane contemporary over without a notice beyond what was taken of it as an acted play. But, independently of this, Mr. Haynes's genius well deserves such a tribute from us; and we most cheerfully offer it.

His dedication to Mr. Macready is finely expressed, and justly due to that gentleman, but for whose noble and liberal efforts the public would never have seen either this or any other of the legitimate dramas which (whatever blemishes may be attributed to them) have raised and adorned our stage within the last three years. It runs thus:—

"My dear Sir,—It is not in the formal spirit of a dedicatory, but with the heartfelt gratitude of a deeply obliged friend, that I beg of you to accept the dedication of this tragedy. It owes you every thing—its production on the stage—its adaptation to the stage—its preparation—its success. The main elements of that success were, the solicitude with which you watched its progress, and the power with which you grasped the character of Ruthven, seized on all the points, whether prominent or latent, and drove them through the public heart by the energy of your performance. But, perhaps, this is a topic which, instead of dilating upon myself, I ought to leave to that fame which cannot be charged with flattery. For all your kindness—for all your exertion—for the position, such as it is, in which I now stand among the dramatists of the day, and which I could not have reached without your assistance, accept this humble, but sincere, tribute of gratitude from your obliged and devoted friend, JAMES HAYNES."

The preface explains so much of the author's ideas in drawing his characters and framing the story and *dénouement*, that we do not think justice can be done to the play without being aware of them. Mr. Haynes says:—

"When I first turned my attention to the subject of Rizzio's death, as the ground-work of a tragedy, I was chiefly attracted by the fierce grandeur of Ruthven's character. It appeared to me, that the picture, which historians had drawn of that remarkable personage, was well calculated for poetical, and even for dramatic effect. Accordingly, I embarked my humble powers, with more ardour than consideration in the attempt to construct a play out of the existing materials, little thinking, at the time, what difficulties my imagination had concealed from my judgment. It was not until I had proceeded too far to retract (for no man likes to throw away his labour), that I discovered how much the scantiness of the materials, the nature of the subject, and even the tone of the characters, were calculated to obstruct my design. Ruthven was too savage, and Rizzio too despicable, to be faithfully represented on the stage; and Mary's attachment to her favourite could not be rendered prominent without the greatest danger, nor evaded without suppressing the only circumstance that could palliate, or, indeed, account for the sanguinary act. I do not presume to say that I have surmounted these difficulties,—that I have produced scenes which, without countenancing the imputation of actual guilt, are still sufficiently marked by indiscretion to soften the otherwise unmitigated horror of the catastrophe: but it was my intention to have done so; and I have stated the disadvantages peculiar to the subject itself, as an apology for those defects with which the drama may be otherwise fairly chargeable."

This statement removes several objections against the structure of the tragedy, and accounts satisfactorily, as far as theatrical representation is concerned, for the alterations made in the historical characters. Ruthven is exalted, it is true; but it is only on a false bottom, for he is still no more than an enthusiast murderer, and vile from the vile use he makes of his innocent daughter. Rizzio, too, is merely elevated sufficiently for stage effect; and the rest stand pretty clear as they have or might have been handed down to us. Mary is charged with no fault beyond indiscretion; and when we (even we, her defenders) recollect of what crimes and guilt she has been accused, we cannot in our conscience think that the author has transgressed in this particular. Friends and foes will, after all the volumes that have been written, decide it their own ways; and we are glad to leave the controversy in their hands, to quote a few brief passages of feeling and poetry from our esteemed author. The second scene of the first act is a fair specimen:—

"A Chamber in Ruthven's House.  
Ruthven reclining on a couch, Catherine standing by him.  
Catherine. My father, are you better now?  
Ruthven. Look out  
O'er yonder hill, where winter, breaking up  
His snowy camp, is hastening to be gone.  
Such is my state!  
Catherine. And yet that gentle sleep,  
From which you've just awakened, gives me hope,  
The crisis past, you will be well again.  
Ruthven. It may be so; but what have I to wish for  
In life? My country's past a sick man's help,  
And past a sane man's hope! 'Tis gone to ruin!  
I've nothing left to wish—to care for, now.  
Catherine. Am I then nothing to you? Oh, my  
father!  
Let me not lose your love; or, if I must,  
Let it be some time hence, that I may play  
The cheat for once, and die before it come.  
Ruthven. Talk not of dying—even in fancy talk not.  
I may not be a gentle father, Kate,  
But I'm a loving one. The bird, that feeds  
Her young with her own flesh, is harsh of note.  
Compare her with the lark that quits her brood  
To sing in upper air—O Kate, you know not  
How dear you are to me.  
Catherine. I do—I do,  
My father—and I bless you for't!"

Morton comes to rouse Ruthven to action, and the colloquy thus opens:—

"Morton. How is't with my friend?  
Ruthven. He lives.  
Morton. Improves, too. Hope's a good physician;  
If art should fail, there's strength in nature still.  
Ruthven. Yes; but the limbs are young, the  
sinews free.  
The very bones elastic; but, in age,  
Weak, withered, and though bent, unbending age,  
The healing office of the blood is o'er,  
And nature's self is on the side of waste  
And dissolution.  
Morton. Talk not so, nor think so;  
Remember what you have been.  
Ruthven. That's my torment:  
For now what am I, grovelling in the dust  
Even of mine own decay? My sword is bent,

My helmet rusted, and the standard brave  
That, like a skirt of Mars, shook overhead,  
In the high wind of battle, clings with mould.  
I have no strength: what can the dying do,  
But, in the base gradation of their fate,  
Become the dead, and rot?"

Rizzio's defence of himself against the insults of the rough Scotch nobles is very spirited:—

"Rizzio. I do not rail against the nobly born  
When merit stamps their claim. I honour worth;  
And rank—for aught I know, who cannot boast it—  
May help the good that nature must begin.  
But, when I see hard-hearted pride rejoicing  
To crush the weak, by Heaven! it drives me mad  
To think that one man should be born for power,  
And 't'other for oppression.  
Darnley. Will you hear  
This insolence?  
Queen. Not if I thought it such.  
Darnley. Then let's decide the cause, and stop the  
pleading.  
Queen. We have no clue to guide us through the maze  
Of contrariety.  
Darnley. But we can judge  
Between the credit due to men of worth  
And men of yesterday?  
Douglas. It asks no skill  
To weigh the credit of a base Italian.  
Rizzio. But, wherefore base?—Explain. Was Rome  
of old  
A land of baseness? Were her patriots base?  
Were the great Cæsars knaves? and Cicero!  
Was he a cheat, and Horace buffoon?  
These were your base Italians!  
Douglas. Nay, you speak  
From books—I spoke of living men.  
Rizzio. And I  
Of men who live for ever! Men, whose names  
Were, like their souls, immortal!—men who stood  
Upon the mountain-top of the whole world,  
The very Ida of the intellect!  
But, look again—I take a later day,  
When Italy and base Italians saved  
The wreck of learning, and the fountain springs  
Of liberty and glory from the Goth.  
What can you shew to match that matchless claim?—  
The glorious East, that in its bosom wears  
The morning, like a jewel, never shone  
So bright, as when the gates of Italy  
Opened to let the flood of science out  
Upon the world, and gilded all the sphere!  
You talk of base Italians! Learn to read,  
And you'll talk otherwise."

These are, indeed, but small samples, yet we must conclude with one more—a poetical simile put into the mouth of Ruthven, after the death of his daughter:—

"Darnley. But are you sure that your late loss  
Hath left no drop of weakness after it,  
Which, at the moment, may unnerve your hand?  
Ruthven. You've heard the story of a Ilouess  
That saw her young whelp by the hunter speared  
One glorious day of chase. A furious she sprang  
From the thick jungle at the multitude,  
And made more havoc in their ranks than wildfire  
In brambles, till she fell. Nor quailed she then;  
For when she fell, 'twas at the bleeding side  
Of her own offspring stretched in death. Close, close  
As mothers lie, she lay to't; stroked the skin  
By hunters rudely torn, and with a lick,  
Which was her kiss, pierced by a hundred wounds,  
Amidst a thousand shouts, she died lamenting  
The baby brute that from her fearful breast  
Drew milk and tenderness. Such as that mother,  
Am I a father. Such the grief I feel.  
Come, follow me, and you shall own its greatness."

#### MISCELLANEOUS.

A Dictionary, Geographical, Statistical, and  
Historical, of the various Countries, Places,  
and Principal Natural Objects in the World.  
Part I. By J. R. McCulloch, Esq. 8vo.  
pp. 128. Double columns. London, 1840.  
Longman and Co.

For adequate labour and research, for sufficient knowledge and ability, for clearness and comprehension in its execution, the name of Mr. McCulloch is by far the highest that could be offered to the public as a guarantee for the value of a work like this. Of a *First Part* it would be premature to speak otherwise than as a specimen of what the whole promises to be; and we have great pleasure in stating that it fully upholds the high reputation of the author, whose encyclopædical mind truly appears to sit him to grapple with all "THE WORLD." As the work proceeds we shall have many occasions

to enter into details: for the present we shall only add, that the plan is admirably laid down, and that much originality is introduced, where under other hands we would have had nothing beyond mere compilation. "Arabia" is the last entry, and all that precedes is treated with necessary care, affording ample information.

A Companion to the Medicine Chest, and Compendium of Domestic Medicine; comprising Plain Directions for the Employment of Medicines, with their Properties and Doses, and brief Descriptions of the Symptoms and Treatment of Diseases, and of the Disorders incidental to Infants and Children, &c. &c. By John Savory, Member of the Society of Apothecaries, London. Pp. 342. London, 1840. Churchill.

THIS is a second, and much-improved, edition of an extremely useful work, the first edition of which received our unequalled approval not long ago. This contains, in addition to the subjects specified above in the title-page, the French, German, and Italian names for each article or medicinal substance, in order that the work may be the more useful to continental travellers; also directions for restoring suspended animation, and for counteracting the effects of poison; a very copious and judicious selection of the most efficacious prescriptions, in English as well as in Latin; and a description of the most servicable mechanical auxiliaries to medicine. This work will be found remarkably useful to families residing at a distance from professional assistance, to clergymen, and to travellers by land and sea. It is a complete system of domestic medicine, in a condensed style and compact form, presenting, moreover, the greatest facilities for reference.

A Glossary of Terms used in Grecian, Roman, Italian, and Gothic Architecture. 3d edition, enlarged, exemplified by 700 Woodcuts. 8vo. 2 vols. 1840. Oxford, Parker; London, Tilt.

AFTER being out of print some time, we are glad to see a third edition of this very useful work. The additions called for are worthy of the original design, and bring the publication nearer and nearer to desirable perfection.

Camp and Quarters; or, Scenes and Impressions of Military Life, &c. &c. By Major John Patterson, author of "Adventures of the 50th Regiment," &c. 2 vols. 12mo. London, 1840. Saunders and Oley.

THIS *olla podrida* tumbles the reader all about the world—Ireland, the Peninsula, the East and West Indies, and every other locality where any regiment has been during the last fifty years! It seems to be the scraping together of the gallant major's commonplace and memorandum books; and, sooth to say, we have been so jumbled with the sudden transpositions, and annoyed by the perpetual use of initials instead of names of persons or places, that we have rather tired in the perusal. C. Mathews appears to advantage as Capt. Patter, in a piece called "Patter versus Clatter," which is very rapid and funny; so let us hope his fellow-soldiers may, like the theatrical audiences, reap amusement from the Major's military performance of Patter's son!

Parliamentary Debate on a Resolution for the Admission of Ladies to the Gallery of the House of Commons. Pp. 12. (London, Bonsor.)—A clever jeu d'esprit written for school recitation at Christmas. It is a fair holiday pastime, and if the young legislators go on as they have begun till they become senators, there will be more fun in the House of Commons than we have been accustomed to see, notwithstanding the public amusement produced by that grave assembly.

Lardner's Cabinet Cyclopædia. Vol. 119. English Poets, by Robert Bell, Esq. Vol. 11. (London, Longman and Co.)—This volume is given to Dryden.—Two centuries of minor poets dismissed in a brief but interesting man-

ner,—Pope, and Young—the whole reflects credit on the editor.—Vol. 120. On the *Habits and Instincts of Animals*, by W. Swainson, A.C.J. F.R.S.—The *questio verata* between animal instinct and human reason is ably treated, but not settled, in this volume; but all the contents relating to the passions, motions, habits, &c. &c., of animals, are replete with interesting matter and curious observation. With Mr. Swainson's theoretical opinions and system we shall not now concern ourselves, but merely note that the lovers of natural history will find much to gratify that love in the volume before us.

## ARTS AND SCIENCES.

## ROYAL INSTITUTION.

FRIDAY, 21st.—Mr. Nasmyth 'On the Origin of Alphabetical Character;' and 'On the Pneumatic Mirror.' Babylonian bricks, made on the banks of the Euphrates, 4000 years ago, exhibit the first principles, the primitive forms of our own alphabet! This singular etymology of form was ingeniously traced and illustrated by Mr. Nasmyth. The first order of bricks presents a simple impression of the angle of a cubical object, or the same with a trail, most easily produced on moist clay, with a cubical stick or style, or with the edge of a hard brick. Probably, as observed, the latter was first used, because of its having perhaps accidentally originated the character. But soon the style must have been employed, for on the edge of a brick of the earliest date Mr. Nasmyth has detected the proof. The impression there affords an exact representation of the instrument which had been forced too far into the clay. The second order varies only slightly from the first, the difference consisting in the top of the character being slightly curved, produced by slowly moving the style edgewise. These characters are made with the same style with the greatest facility, and of any size, dependent upon the depth of the impression in the clay, and are capable, moreover, of infinite combination; indeed the variety is truly astonishing. The mode of combining the elementary to form alphabetical characters was shewn. The next stage manifested by the present remains of those by-gone days is the production of the precise character by the chisel; and in these cases its adoption as the representative of language, whatever that may have been, is recognised. The bricks of this period afford evidence of this, as also of the carving of blocks for the purpose of stamping on them, previously to drying or baking, a page of writing, or rather of printed characters, now not *intaglio*, as in the original, but *cameo*. Printing upwards of 3000 years ago!! Yes; and with the *modern* improvements of the stereotype, and of the cylindrical press. Babylonian cylinders of hardstone, agate, chalcedony, &c. engraved with these letterpress characters, are to be seen in antiquarian collections. A depressed angle is the fundamental and characteristic principle of, and inherent to, the form of the primitive simple impress, and is also the marked peculiar of the alphabetical signs. It is this property which Mr. Nasmyth has recognised in the primitive Greek letters, and which stamps their relation to the Babylonian characters. He pointed out the depressed angle, true to itself, and not parallel to the line, as in modern writing, especially in the base of the alpha. Others exhibited this striking affinity, this retention of the original form, after a lapse of 2000 years, shewing man's tendency to cling to form when its origin has passed away. To the Phœnicians, who had most intercourse with the Babylonians, was attributed the communication of this distinctive basis. In the Roman era particular care was taken to represent the depressed angle in the bottom stroke of the letters; and from our own alphabet, within fifty or a hundred years

only, has the true Babylonian original vanished. For, up to that time, it was customary to form the seraph of the T above the line, strikingly retaining the primitive characteristic. With the aid of a slab of moist clay, a cubical style, and diagrams, Mr. Nasmyth most clearly explained his interesting views. Aidless descriptive yields to illustrated oration. The time set apart for the evening illustrations not having been wholly occupied by the foregoing subject, Mr. Nasmyth exhibited and explained his "Pneumatic Mirror," which attracted considerable attention. It will be remembered, doubtless, by our readers, that this simple and singular invention was made public at the British Association last year, and described in our report of the Birmingham meeting (*Literary Gazette*, No. 1180). The objection there stated to its use for telescopes, Mr. Nasmyth considers merely theoretical, and to be overcome and counterbalanced by the practical benefits to be derived from its application to astronomical purposes. The heating powers of these mirrors are enormous, and realise the traditionary wonders of the burning-glasses of Archimedes. They may yet, in consequence of the facility of adjusting the focus to any distance, be employed offensively and destructively, as it is told of their prototypes at the siege of Syracuse. But by prototype we mean not to hint that the pneumatic mirror is a copy. We agree with Mr. Nasmyth in believing that defective translation gave rise to the report, and that *specula ardentia* may have been rendered *specula ardentia*. Neither Livy nor Polybius recount burning-glasses among the terror-striking inventions of Archimedes. And in Rollin's "Ancient History" they are mentioned as modern tradition. Another application, suggested by the inventor, was the bringing to perfection, in our conservatories, tropical plants. By it the requisite intensity of light, as well as heat, may be concentrated, to produce in them the brilliant perfection now only to be witnessed in tropical regions.

[We have always much satisfaction in noticing the progress of local institutions like this; for, notwithstanding the British Association, it is only by the permanent establishment and liberal support of such societies throughout the country, that general information and improvement can be sufficiently found for the people.—Ed. L. G.]

## TWEEDSIDE PHYSICAL AND ANTIQUARIAN SOCIETY.

A QUARTERLY meeting of the Tweedside Physical and Antiquarian Society was held at the apartments of the Institution, Sir T. Macdougall Brisbane, Bart. the Society's president, in the chair.—The attendance of members was more than usually numerous; and the business of the day passed off with a degree of spirit which proved that the general interest taken by the public in the affairs of the Institution had undergone no diminution. The donations, which were announced as having been received by the Society during the interval which had elapsed since the last quarterly meeting, were not only remarkable in point of number, but many of them were of a most interesting and valuable description. These are detailed in 1. Department of Geology and Mineralogy; 2. Numismatics and Greek and Roman Antiquities; 3. Mediæval Antiquities and General Curiosities; 4. Botany and Zoology; 5. Library; and 6. Meteorological Department, &c. His Grace the Duke of Roxburgh, Sir T. M. Brisbane; Mr. Selby, of Turzell; Mr. Lister, of Newcastle; Dr. F. Douglas, of Kelso; Mr. Selkirk, of Jedburgh, &c. were among the donors. The career of the Society has hitherto been one of uninterrupted

success. Its first meeting was held on the 4th February, 1834; and, on the same day, the first donation to the museum reached the Secretary, and was placed by him in what might be termed the fragment of a second-hand book-case, which then constituted the whole furniture of the establishment. Now the Institution is in possession of a handsome edifice, its own property, in which are placed upwards of one hundred cases, containing ample illustrations of the ornithology, entomology, and botany of the district; its geological and mineralogical specimens are numerous and interesting; and its collection of coins, antiquities, and of general curiosities, is sufficiently extensive to occupy, for many hours, the attention of the curious visitor; while of botany, as applied to agriculture, there are also ample and valuable illustrations.—*Abridged from the Kelso Mail.*

## PARIS LETTER.

Academy of Sciences, Feb. 25, 1840.

SITTING of February 17.—M. Poisson in the chair. The Academy proceeded to a ballot for a member in the room of the late M. Dulong. M. Despretz has been placed at the head of the list by the section of Physical Sciences; but, on a ballot of the whole Academy being taken, M. Babinet, whose researches in optical science, and the improvements of optical instruments are well known, obtained 35 votes, while M. Despretz obtained only 19. The former was declared duly elected.—M. Arago communicated to the Academy the principal results obtained during the last scientific expedition to Spitzbergen, and the north of Norway and Lapland, by Messrs. Lottin, Bravais, and Martins, who were charged with the operations relating to geography, terrestrial physiology, and meteorology. The geographical and hydrographical operations of the expedition united the labours of Scoresby on the western coast, with those of Parry on the northern shores of that island. Numerous observations had been made for determining atmospheric refraction at very small elevations above the horizon. In the tidal observations particular attention was paid to the lines of different elevation left by the water; and it was found that, although at points near each other the observations shewed the lines to be nearly horizontal, yet for distant points the horizontality was by no means preserved: so much so, that while the ancient level of the sea was shewn to have been at 85 metres above the present level at one point, it was only at 22 metres at another. This change, it was concluded, could have been caused only by the up-heaving of the coast. Several of the best instruments carried out by the expedition had, with the permission of the French government, been given to eminent native observers to continue their researches.—An interesting communication was read from Mr. Milne Edwards, member of the Academy, on some pyrosomatic animals found by him in the Bay of Villefranche, near Nice. He had been able to observe all the phenomena of their circulation and respiration. All the vibratory hairs of their bronchiæ move and whirl about with extreme rapidity, but with perfect harmony; the heart is placed at the lower part of the body, by the side of, and below, the visceral mass, and performs its contractions in a peristaltic manner. The order of circulation, too, changes from time to time in this animal: those vessels that at one period served as arteries performing at another the functions of veins. This anomalous mode of circulation was considered by Mr. Edwards as having been thus found in all

the grand natural divisions of Lamarch's class of *Tunicata*.—A supplementary discussion ensued between M. Dumas and M. Pelouze on the theory of chemical substitution, but no new facts or observations of interest were elicited.—M. Dumas also communicated some results of observations on the action of alcohols on alkalies.—M. Biot read an interesting paper 'On the Determination of the Saccharine Properties of the Juice of the Sugarcane, by the Polarisation of Light.' He had submitted to the test of circular polarisation a portion of the *vesou* juice which had been employed by M. Peligot in the valuable experiments which were lately mentioned; and had found, that, through a tube of 152 millimetres in length, this liquid gave to the plane of polarisation of the red ray a deviation of 18° towards the right hand of the observer: this was exactly the deviation that would be caused by a liquid impregnated with an aqueous solution of crystallised sugar, in which the sugar entered in the proportion of 20 to 100. Saccharine juices with less power of crystallisation caused a smaller deviation; and M. Biot suggested, that this property might be employed by sugar-growers and refiners as a means of testing the relative productiveness of various juices.—M. Robiquet read a report in the name of M. Dumas and himself 'On the Waterproof Composition of M. Menotti, as applied to all kinds of Stuff.' This composition was styled by its inventor, *Savon hydrofuge*, and the nature of it was hitherto a profound secret to all but the members of the examining commission, to whom M. Menotti had communicated it. The great cheapness of it was one of its principal recommendations: a smockfrock could be dipped in it, and rendered perfectly waterproof at a cost of only 40 centimes (about 4d. English).—M. Biot presented to the Academy several photographic images obtained by the passing of the Drummond light through various lenses, and ultimately through a transparent painting. The representation of this painting was obtained in black and white on the iodised surface of the metallic plate with great distinctness.—M. Morin read a note upon two mechanical apparatus of his invention for measuring the quantity of power exercised by any machine. According to his method, M. Morin had succeeded in computing exactly the quantity of power borrowed from any steam engine, and had applied it to several factories in which such power was hired out from one central engine to various persons. One of these machines was destined to count this power during a brief period, the other could do the same for several weeks.—M. Colin, engineer of the Ponts et Chaussées, addressed a memoir to the Academy 'Upon the Spontaneous Slippings of Land, especially in Banking Operations.' He shewed that the prism of thrust was terminated not by a plane, but by a cycloidal surface.—M. Leblanc communicated some fresh instances of the communication of glanders and farcy from horses to human subjects. M. Majendie again took occasion to deny the correctness of the experiments, and undertook, upon the exhibiting of the actual preparations before the Academy, to prove what he stated.

*Académie Française*.—Sitting of Feb. 20. The great event in the literary world for this week, and which has produced an extraordinary sensation in Paris, has been the elections in the Académie Française to the chairs vacated by the deaths of M. Michaud and the late Archbishop of Paris. In the first chair two previous elections had been held, but had not led to any result; none of the candidates having obtained the absolute majority of votes. At

this the third election, all the political candidates having been withdrawn there remained only Victor Hugo in the field, and it was supposed he would be elected: but at the eleventh hour the opposing faction in the Academy brought forward an eminent man as a candidate, M. Flourens, perpetual secretary of the section of natural philosophy in the Academy of Sciences, and professor of comparative physiology at the Garden of Plants. Three ballots without any result took place: at the fourth, three of Victor Hugo's supporters went over to M. Flourens, and he had 19 votes against 11. Those who at first voted for Victor Hugo were Chateaubriand, Lacretelle, Villemain, Lebrun, Ségur, Pongerville, Feletz, Lamartine, Thiers, Nodier, Viennet, Dupin, Salvandy, Guizot, Cousin, and Mignet. Those for Flourens included the dramatic authors, Scribe, Casimir Delavigne, Dupaty, Lemercier, Etienne, Jouy, Baour, Brifaut, and Roger. Messrs. De Cessac and Roger Collard abstained from voting. It came out afterwards that Dupin, one of the greatest marplots in France, was in a hurry to get back to the Chamber of Deputies that day to vote on the Duc de Nemours' dotation bill, and so he determined to go over to Flourens in order to bring the election to a close. The others followed his example! It has been a cause of much subsequent amusement, that three of M. Flourens' supporters knew so little about him that they all wrote his name wrong, and in a different manner, on their balloting tickets.

M. Michelet's fourth volume of his learned "History of France" has just been published. It relates to the interesting period of Charles VI., and the establishment of the English in France. This volume is equally remarkable with the former ones, for the deep vein of poetic feeling that runs through it, and the intimate knowledge of the social condition of France, which none but men of profound reading like M. Michelet, and there are not many such, can pretend to.

There are several new picturesque works now coming out, which, from the glances we have had of them, are well got up, and contain much interesting matter. "L'Ancien Bourbonnais," by Messrs. Allier Michel and Batisier, published at Moulins, is a very creditable work, and does much honour to the antiquarian spirit of that town. "La Bretagne Pittoresque" is another work of the same nature: and the African possessions of France have also found a topographer in M. Hatin, who announces a picturesque history of Algiers.

We have heard Moke's "History of Belgium," published at Brussels, well spoken of, but have not seen it. Captain Iafont has just sent forth the first of a series of volumes with the general title of "Quinze Ans de Voyage autour du Monde," which promises to be a valuable work. The author, during fifteen years, has sailed in the Pacific Ocean, and has visited China, the Sandwich Islands, New Holland, New Zealand, Mexico, &c. He participated in the war of independence in Mexico, and has seen what may be called a good deal of the world. This work is the result of his observations.

M. Alphonse Karr, the well-known novelist, is publishing a series of politico-literary satires called "The Guêpes," in which he "shews up" every thing and every body. "Les Papillons Noirs" of Bibliophile Jacob are something of the same kind. A third publication of the same stamp is announced for 1st March: its title is to be "Hic, Hæc, Hoc, Cancans de l'an 40:"—these are just the things for the fribbles of Paris.

A valuable envoy of pictures has just been received at the Ecole des Beaux Arts from Rome, being twelve large copies (18 feet by 12) of parts of paintings in the "Sixtine Chapel," by late M. Sigalon; and are to be placed where his copy of "The Last Judgment" has long been fixed, in the chapel of the former convent of the Petits Augustins, now turned into the Ecole. Talking of pictures, we see that M. Deatigny, of Caen, who has long published a periodical political satire, called "Nemesis," has advertised "A Poetical Review of the Exhibition of the Louvre for 1840." We learn, from Montpellier, that the lectures on history and foreign literature, in the newly established Faculty of Arts, are so numerous attended, that sentinels are placed at the doors of the lecture-rooms to keep the people from thronging in too fast.

It has been ascertained that the Artesian well, now boring in the Abattoir de Grenelle, near the Champ de Mars, has reached a depth of 508 metres: the strata being as follows:—alluvium, 30 metres: plastic clay, 30: white chalk and flint, 400: argillaceous chalk, white and green, without flint, 40: blue clay, fossiliferous with pyrites, 8:—total, 508. Beneath this latter stratum lies a bed of sand, in which water is expected to be found. The lower part of the bore is now lining with a tube, and some more experiments on central heat will be made.

#### LITERARY AND LEARNED.

##### UNIVERSITY INTELLIGENCE.

OXFORD, Feb. 20.—The following degrees were conferred:—

*Bachelor in Civil Law*.—Rev. H. Holloway, Fellow of New College.

*Masters of Arts*.—Rev. R. F. B. Richards, Balliol College, Grand Compounder; Hon. E. C. Curzon, Christ College; Rev. H. Mills, Balliol College; Rev. G. Carter, St. John's College; Rev. C. H. Tyler, Trinity College.

*Bachelors of Arts*.—W. L. Wigan, Christ Church; B. C. Warren, Exeter College.

##### ROYAL ASIATIC SOCIETY.

FEB. 15th. Sir George T. Staunton, Bart. M.P., in the chair.—After routine business, elections, &c., the reading of Sir John Macdonald's review of Colonel Evans's work "On the Practicability of an Invasion of British India" was concluded. Although this paper was written ten years ago, the intimate acquaintance of the writer with the countries to which the tract in question related, and the recent occurrence of important events in those countries, could not fail to give a lively interest to the descriptions and observations of the reviewer. The work of Col. Evans contemplated the probability of Russia subjugating the whole of Turkestan, taking the route of Khiva, Bokhara, and Balkh, and of establishing a provisional government there in one campaign; and then it assumed, that with that possession as the basis of further operations, another campaign would suffice to carry her army over the Hindoo Coosh to Cabool, and thence by Peshawar to the Indus. Sir John Macdonald goes over the whole of Col. Evans's positions, and shews that his conclusions have been deduced from his having taken too high an estimate of the power of Russia; and from his having, at the same time, mistaken the general character and the natural difficulties of the route, as well as the probable resistance of the inhabitants of the countries to be traversed. We can afford room for nothing more than a summary of Sir J. Macdonald's reasons for coming to a different conclusion from Col. Evans on the subject in question. He remarks on the difficulty of providing an army in its march through a country which, though containing many fertile spots, is

yet, in the greatest part of its surface, a region of dreary and cheerless wastes, marked by a total absence of herbage, fuel, and wholesome water; with its plains bare and unpeopled; its mountains covered with snow for half the year; and its fertile valleys, at one moment the seat of plenty and enjoyment, at another, given up to blood and devastation. He does not admit the practicability of converting into good and efficient soldiers, within a few months, the 30,000 Russian and Persian slaves now in captivity in Khiva and Bokhara, where hard usage, toil, and insufficient food, must have reduced their moral and physical strength much below Col. Evans's estimate of their powers; and of whom the Persians, who constitute at least half the number, would, if set at liberty, be more likely to return to their own homes than to aid new masters in further schemes of conquest. He states that Col. Evans is deceived in his opinion of the ease by which the Oxus may be ascended; and remarks, that Nadir Shah, with his light and unencumbered troops, unaccompanied by the baggage, ammunition, and artillery necessary to an European army, had great difficulty in his progress on that river; and that his course, too, was with the current, while the Russian vessels would have to be dragged by horses and men against the stream; that the estimate made by Col. Evans of the load which a camel can carry is nearly double the reality, the load of a camel in Persia not being above 400lbs, while Col. Evans supposes that three camels can carry above a ton: that in estimating the number of camels in the neighbourhood of Khiva at 100,000, because that number annually pay a tax at the gate on entry, he has quite forgotten that each camel may pass the gate several times in a year. He observes, also, that one argument employed by Col. Evans to prove the abundance of camels is, that every soldier on a march is accompanied by one to carry provisions; while the plain inference from that fact, namely, that provisions are very scarce, has not been drawn by Col. Evans. Sir John gives a lucid geographical account of the countries intervening between the Caspian and the Indus, by every road which can be followed. He describes the habits of the native tribes; their independent mode of life; the ease with which they leave their homes and withdraw to the desert; the feuds always existing between different tribes; and notices their cunning policy in availing themselves of the rival powers in their neighbourhood, whom they play off against each other to their own advantage. These, and many other difficulties, in the opinion of Sir John Macdonald, would concur to render that a very difficult task which appears to Col. Evans so easy. The examples of the rapid advances of Alexander, Mahmud, Timur, and Nadir Shah, so often adduced, are, in many points, shown to be quite inapplicable to the case under consideration. A strong contrast was drawn between the character and habits of those conquerors and their hosts, and the physical and national habits of the Russians; as well as between the impressions produced by the respective armies on the nations through which they had to pass; and, lastly, observed that, supposing the hostile advance effected to the borders of the British territories, the country arrived at would be found in the hands of one of the most powerful nations of Europe, fully able to cope with any army that could be brought against it. A sketch of the sort of military operations to be put in practice on and near the Indus, admitting for a moment the practicability of an enemy proceeding so far, was then given; and the paper concluded

with a well-deserved eulogy of our native troops, which it conceived to be, both morally and physically, equal to any exertion that might fairly be demanded of them. The reading of this paper was followed by another, containing 'Observations on Colonel Evans's Tract, and on the foregoing Paper,' by Sir John Malcolm, who adds the weight of his opinion in support of the views taken by Sir John Macdonald.—Mr. E. Solly read papers on several articles of Indian produce. The first related to the attempts which had been made to introduce the fibre of the leaf of the pineapple, or *anasas*, as a substitute for flax. Mr. Solly stated that a patent had been obtained by Mr. Zincke for the manufacture of the thread; and that the patentee had found the fibre could be spun far more readily when bleached than before that operation: but Mr. Solly considered that the expense of this substance would hardly admit of its entering into competition with flax and other fibrous substances.—This paper was followed by a 'Notice of a New Indian Gum Resin,' likely to be of considerable utility in the arts, particularly in the manufacture of varnishes. Mr. Solly also alluded to an examination which he had made of a variety of samples of the productions of Mysore and the Punjab, and into a collection of dyes from India.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday.*—Entomological, 8 P.M.; British Architects, 8 P.M.; Medical, 8 P.M.  
*Tuesday.*—Linnean, 8 P.M.; Horticultural, 3 P.M., Civil Engineers, 8 P.M.; Electrical, 8 P.M.  
*Wednesday.*—Society of Arts, 7½ P.M.  
*Thursday.*—Royal Society, 8½ P.M.; Antiquaries, 8 P.M.; Zoological, 3 P.M.  
*Friday.*—Royal Institution, 8½ P.M.; Botanical, 8 P.M.  
*Saturday.*—Asiatic, 2 P.M.; Westminster Medical, 8 P.M.; United Service Institution (Anniversary), 2 P.M.; Physical, 8 P.M.

#### FINE ARTS.

##### NEW PUBLICATIONS.

*Napoleon at Eylau.* Engraved by Lucas, from the Original Picture by Gros. M'Lean.

THE subject is the visit of the emperor, accompanied by his generals (Murat, Berthier, Soult, Davoust, Bessieres, Caulaincourt, Mouton, Gardanne, and Le Brun), on the morning of the 8th of February, 1807, to the field of the battle which he had gained on the preceding day; and which is thus described:—

"The battle of Eylau, fought on the 8th of February, 1807, was a scene of carnage which lasted from morning until night. Let any one imagine to himself, upon the space of a square league, nine or ten thousand dead bodies, four or five thousand horses killed, whole lines of Russian knapsacks, broken pieces of muskets and sabres, the ground covered with cannon balls, howitzer shells, and ammunition, twenty-four pieces of cannon, near which were lying the bodies of their drivers, killed at the moment when they were striving to carry them off!—and all this was the more conspicuous, as the ground was covered with snow. About noon on the 9th, Napoleon rode over the field. The emperor stopped continually to question the wounded, to console and encourage as many as possible. The Russians, instead of the death they expected, found a generous conqueror, and, prostrating themselves before him, held up their hands in token of their gratitude."

There is great merit in the composition and design of this spirited and striking work. The expression of compassion and concern in the emperor's countenance amounts almost to that which, however, we fear he never entertained

until it was too late—compunction. Upon the whole, we have seldom seen a more forcible and impressive representation of "the horrors of war."

*The Eglintoun Tournament.* Edward Corbould, del. et lith. Hodgson and Graves.

WE have repeatedly noticed in our columns, with the admiration which was their due, the skilful and powerful drawings contributed by Mr. Edward Corbould to the exhibitions of the New Society of Painters in Water-colours. Unless, however, we much deceive ourselves, the work before us is that promising young artist's first publication, and we are happy to add that it does him high credit. It represents, with great spirit and beauty, the splendid and animated scenes of gallantry (in both senses of the word) which occurred at Eglintoun Castle in August last. Besides an appropriate and tastefully ornamented title-page, the volume contains eight well-selected subjects: viz. "The Tilt-ground at Eglintoun Castle;" "The Lord of the Tournament (Lord Eglinton) with his Esquires and Retainers;" "The Queen of Beauty advancing to the Lists;" "The Joust between the Lord of the Tournament and the Knight of the Red Rose;" "The Lord of the Tournament, as Victor, presented to the Queen of Beauty;" "The Mélé at the Eglintoun Passage of Arms;" "The Staircase leading to the Ball-room at Eglintoun Castle;" and "The Ball-room at Eglintoun Castle." A concise, but highly-wrought typographical description precedes the plates.

*A Righte Faithfull Chronicle of the Ladies and Knights who gained Worship at the Grand Tourney holden at his Castle by the Earl of Eglinton.* 12mo. pp. 136. Saunders and Otley.

THIS little book does not properly belong to "The Fine Arts," but (as the French say) it "goes so well" with the interesting work which we have just mentioned, that we do not like to separate them; and we strongly advise purchasers of the one to become purchasers of the other. They will then be the possessors of a faithful, and complete, and finely-illustrated record of one of the most brilliant and curious events of modern times. Mr. Bulkeley has evidently performed his task *con amore*. Beginning with the approach and arrival of the innumerable visitors, he then describes the armour, equipments, and retinue of the respective knights, relates the glorious triumphs and sad disasters which occurred in the lists on the days of chivalric encounter, reports the eloquent speeches which were made by both host and guest at the magnificent banquet, expatiates on the exquisite elegancies and delights of the succeeding ball, and concludes with an account of the final dispersion of the vast assemblage. An appendix details the costume of the most distinguished individuals, male and female. To shew the enthusiasm with which Mr. Bulkeley treats his inspiring theme, we will quote the closing passage of his brief history of tournaments:—

"As a military exercise, the tournament must ever rank the noblest, and as best fitted to perfect the chevalier and charger. As a pastime, it is the most dignified, graceful, and elegant; pure from all the baser excitements of gain and gambling; aloof from all that is low, gross, or cruel; it seeks for its reward in the applause of the most beautiful and noblest part of the creation. The enclosure of commons, warrens, and parks, the railroads bisecting the country in every part, change of manners, may ultimately render the chase as unpur-

sued as hawking; the tournament with care, proper regulations, strict attention to arms and armour, still offers itself to brace the nerves, give elegance and skill, and make the perfect cavalier. With these advantages, may it recall to recollection, and foster the virtues, the valour, devotion, justice, humanity, sincerity, temperance, truth, that adorned the knight *sans tache et sans peur*; while fair maidens, proud of their increasing influence, shall each day become worthier of the heroism they inspire.

" 'T hath been through all ages ever seen,  
That with the praise of arms and chivalry  
The prize of beauty still hath joined been,  
And that for reasons of special privacy:  
For either doth on other much rely;  
For he, me seems, most fit the fair to serve,  
That can her best defend from villany;  
And she most fit his service doth deserve  
That fairest is, and from her faith will never swerve!"  
SPENSER, *Fairy Queen*."

## ORIGINAL POETRY.

YES, CHIDE ME IF THOU WILT.

Yes, chide me if thou wilt, and still  
I'll love thy tongue although it chide me;—  
Nay, bid thy very coldness kill,  
I am content to die *beside thee*!  
For, dearest, with thy thoughts to be  
Is bliss, though words of sorrow wring me;  
And sweeter *hopelessness* for thee  
Than aught the world hath left to bring me!  
But yet, for mercy's sake, forbear  
That chord which reason binds to sever;  
For though to love be but despair,  
*Despairing* must I love thee ever!  
And should'st thou e'er forbid my feet  
To follow thine, in loving sadness,  
To cling e'en to despair as sweet,—  
That word, which *banished me*, were *Mad-*  
*ness!* C. SWAIN.

## COMMERCE.—A SONNET.

THOU golden link of nations! Far and wide  
Thine arm extends:—it grasps each distant  
shore.  
Thee from thyself winds keep not—as of yore,  
Nor mountains intercept, nor seas divide;  
Unchecked thou art by mountain, wind, or  
tide!  
*Earth's bowels are thy vitals*: iron ore  
The tract on which thou bearest all thy store,  
Dashing—like lightning—in thine onward  
pride!  
Impulsive quick'ner of the human brain,  
Thou peaceful genius of my native land,  
I fear thee, while I greet thee. Thing of gain,  
How soon men learn thy ways to under-  
stand!  
O! since Religion follows in thy train,  
Enlarge her borders through thy "social  
band."  
Lambeth. JOHN PEAT, M.A.

## ANACREONTICA.

## VI.

ῥύσις κίερα ταύροις,  
ὄρελās, κ. τ. λ.

NATURE to the bull gives horns,  
And with hoofs the steed adorns;  
Teeth to lions, sharp and grim,  
And to fishes fins to swim;  
Wings to birds, light feet to hares,  
And to man deep thought she shares.  
Woman! nought is left for thee,  
Say, what shall thy dowry be?—  
For spear and shield, to thee hath Heaven  
Beauty as a dowry given:  
And lovely Woman bath a charm,  
Fire to quench and steel disarm!—R. B. S.

## THE DRAMA.

*Covent Garden*.—A great mistake (the first of the present management) was made here last Saturday, in the production of an opera, which failed. Yet there was some pretty ballad music in it, and two airs by Harrison pleased us much, and both opening and finale were good. The rest was ruined by mediocrity, sameness, and tameness; every bar seemed an echo of something heard before, and we felt only pity that any composer should have made so anxious and laborious a waste of his time.

*Olympic*.—Here a total change has taken place in the entertainments. Dull pieces have been withdrawn immediately on *non success*, and in their stead we have others, whose *success* is proclaimed by the good-humour and applause of the audience. This is the right sort of management, and if persevered in will bring its reward. The actors play with increased spirit, where they feel more hopeful as to the result of their exertions; and, indeed, we could scarcely believe this to be the same theatre, with the same company, we visited a fortnight ago. So much of praise, and now for one word of advice.—Coarseness will never draw a good audience to the best parts of the house, and one of the pieces still acting is open to censure on this score; at the same time, it is cleverly written and capitally acted. On Wednesday *The Ladies' Club*, a smart piece in two acts, was performed for the first time with *éclat*. Mrs. Glover, as *Chairwoman*, was ably supported by Mrs. Garrick, Miss Fitzwalter, Miss M. A. Atkinson, Miss Treble, &c.; and by Messrs. Turnour, Halford, Ross, Baker, Brooks, Pitt, &c. who, though at their club, were quite at home, some with their wives and all with their parts. *Flammer*, a footman, humorously played by Mr. G. Wild, and *Fricandeau*, a French cook, by Mr. Morris Barnett, were good accessories. A new burletta, in one act, by R. B. Peake, Esq. was also produced on Wednesday, and met with a very favorable reception, it is entitled *My Home is not My Home*, supported by Mr. Jones with great force and nature. The style is quaint, and the equivokes ludicrous. We observe several novelties of good authorship in the preparation list.

*Quartet Concerts, Hanover Square Rooms*.—The second concert, held on Thursday evening, was more fully attended than the former one. The instrumental music was, as usual, of first-rate character, and agreeably relieved by the singing (between each piece) of Madame F. Lablache and Miss Rainforth.

On Monday, Miss Chambers' Concert was given at the Albion, in Aldersgate Street, when we rejoiced to see a well-filled room give evidence that neither kindly feeling nor generous patronage are confined to our West End circles. Amongst the performers were Miss Millengen, who sung an English ballad very sweetly. Madlle. Ernesta Grisli, who gave an aria with taste and feeling. Signor Brizzi, in one of the most charming romances to which we ever listened, "Pendant la Fête," was warmly encored. Signor Sola, who is a host in himself, gave us a MS. trio concertante for flute, violin, and piano-forte accompaniment, which was one of the most agreeable performances of the evening. The theme, taken from Rossini's "Matilde e Corradino," was admirably played by the composer, Mr. T. Baker, and Mr. Deacon. It is well worthy of his celebrity, and a place among his preceding works, so popular both in public and private performances. Mr.

A. Sola gave a song from the "Cenerentola" in the true Italian style. Several songs, with flute obligato, were sweetly sung in the course of the evening, by Miss Bruce, Miss Byfield, and Mrs. A. Smith. On the whole, Miss Chambers had cause, we trust, to be fully gratified with the support and approbation her concert received.

## SIGHTS OF LONDON.

HER MAJESTY visited Drury Lane in state on Wednesday, accompanied by her princely husband; being his first appearance before an English audience. Both seemed to be considerably affected on the occasion, though the reception was warm and cordial.

Of Mr. Catlin's American Indian exhibition at the Egyptian Hall, we have, in several of our Numbers, spoken in the terms of approbation, which its novelty, extent, and interest, deserve.

In like manner, most worthy of inspection is Mr. Schomburgk's exhibition of the products, &c., of Guiana in Regent Street, to which we have also directed the attention of our readers. It is gratifying to observe, that among the "Sights of London," usual at this season of the year, we have several of the most laudable description. A few hours at Mr. Catlin's impresses upon the spectator an infinitely more complete knowledge of the red races in the New World than would the perusal of all the books that were ever written on the subject; and equally in Mr. Schomburgk's gallery are we enabled to make a familiar acquaintance with the natural productions and the natives of Guiana;—of Guiana, a colony in itself of the utmost importance to the mother country, and of which to the present time we may say the mother country has been almost totally ignorant. Mr. Schomburgk well merits our thanks for this collection, not only of the fruits, the flowers, the animals, birds, and reptiles (admirably preserved in their skins and plumage), the ornaments, the weapons of sport and war, the odoriferous gums and fatal poisons, and other objects of instruction and curiosity, but also for shewing us the natives of the clime, three of whom are constantly present. These are studies for the philosophical, as well as *sights* for the mere observer. Their habits are singular; and though brought from within a few miles of each other, their languages are so different that one of them is utterly unintelligible to the other two, and between the latter but a few words are understood, so that the process of interpretation among them is rather amusing. Their discharge of arrows through a tube of eight or ten feet in length is a singular exploit. The arrow itself is like a child's toy, not a foot long—it is inserted in the tube—the Indian puts it to his mouth, inflates his cheeks, puffs, and off it goes with unerring certainty to the mark at thirty or forty yards' distance. By this means and the famous Woutali poison, the largest animals are slain, and the smallest humming-birds brought down from the trees. The bow-and-arrow shooting is also well worthy of remark; but the whole, as a source of useful information, ought not to be missed either by young or old.

Another very interesting exhibition is just

\* In his lecture on Thursday evening, which was attended by several of the nobility, as well as a numerous and genteel auditory, Mr. C. gave some curious accounts of the ball-play, which was the same for 2000 miles of country from north to south. So great was the emulation in these dexterous contests, that the squaws caught up switches, &c., and literally whipped their husbands into their utmost exertion.

above; namely, a representation of East Indian Fruits. These, about forty in number, are by a native of the Mauritius, and finished in the most natural and beautiful style. Even as works of art they are deserving of the public regard; but as exact resemblances to the various products of the East, which fill our marts with preserves, dyes, useful articles, and luxuries,—the banana, guava, &c. &c. &c.—they are not only great novelties, but pleasant teachers of botany and natural history.

The Polytechnic and the Adelaide Galleries continue full of attractions, and places which cannot be examined without infinite satisfaction and benefit to all classes, and especially to the young.

At the St. James's Gallery in Pall Mall (advising a look at the adjoining British Institution by the way) are to be seen a painting of the celebrated Charles I. on Horseback, said to be by Vandyke, for his majesty's master of the horse, the Duc d'Anguillon; and a very fine picture of Lot and his Daughters, ascribed to Velasquez. It is not in the usual manner of that glorious master; but it is a noble work. The heads of the two female figures are exquisitely turned, and the countenance of the principal, pointing towards the burning city, as charming and expressive as any we ever saw: never was character more finely delineated—the physical and yet not the sensual prevailing over the intellectual. It is a picture in itself, but the entire grouping is fine; the draperies carefully done; the old man, a warning to the intemperate, and the rocky back-ground and distance on the right, are, in our opinion, exceedingly appropriate and beautiful.

In Great George Street, Mr. Bewick has opened to view his excellent cartoons, or large studies, from the works of M. Angelo at Rome, executed for the late President of the Royal Academy, and which will, we trust, either altogether or by a numerous selection, be secured to our great National School. Persons who have not been at Rome can have no idea of the splendid productions of M. Angelo, till they enjoy the gratification of looking upon these copies, the execution of which does infinite honour to Mr. Bewick. Several other curious gems of art, particularly a copy of Cupid and Swans after Raffaele, are also from the hand of the same artist. Never did we see such lovely and playful swan-hopping (properly swan-apping) as this.

In Maddox Street, we have a fine model of St. Peter's Church of Rome, on a very considerable scale. It is a very handsome work, and affords a perfect idea of the splendid pile.

At the Horns Tavern, Kennington, on Thursday evening, there was (for the season) a good show of the South London Horticultural Society: and every night the *Great Wizard of the North* performs his magical feats at the Strand Theatre. With these we have been very much entertained, and we may add, astonished, for they are indeed dexterous and extraordinary. Legerdemain of a very superior kind is the order of the night; and what with the laughable and the wonderful tricks, the audiences who fill the theatre are perfectly satisfied.

Elsewhere we have criticised two works of art on the famous Eglintoun Tournament. Those who want to see the thing itself—the knights and the squires in their habits as they lived—have only to walk to Mr. Pratt's superb exhibition in Lower Grosvenor Street. There, in the same perfect and great variety of splendid armour and costumes, on horseback, attended by pages and men-at-arms, with gonfalons and

all the pomp of chivalry, they are arranged with great effect; and the spectacle (without the rain) is a delightful treat.

Too late for us to inspect and describe this week, there is a collection of admirable paintings (Watson Taylor's) on view at Messrs. Christie and Manson's rooms—Mr. Atherstone's "Magdalen," ascribed to Correggio; a gallery of the old foreign masters, by Mr. Nicolay; and on Wednesday Mr. Howell commences his Lent illustrations of astronomy.

Last night the Queen and Prince Albert, in state, bespoke the play at Covent Garden; and we include royalty among our sights, because the prices of admission were raised on their account, making, say so much for the entertainments, so much for Her Majesty, and so much for her princely husband.

#### VARIETIES.

*Sacred Antiquities, MSS., &c.*—On his return from Egypt and Palestine, Mr. Tattam, in a letter addressed to the Bedford newspaper, says:—

"I should rejoice to hear of a few English gentlemen, of leisure and ability, uniting themselves for the purpose of accurately exploring all that tract of country which the Israelites passed over, from the commencement of their journey from Egypt, until they entered the promised land; and then to survey Palestine in the same way. Their first object would be to determine, as nearly as possible, the route the Israelites took to the Red Sea, and where in all probability they passed over. In doing this it will be necessary to examine the Egyptian desert, from the Convent of St. Antonio to Suez. This part of the country should be accurately surveyed and described, and its geological appearance, and its botanical and other productions, correctly stated. The same careful survey, examination, and description, should be continued from Suez to Sinai, and from Sinai throughout the desert and the Holy Land. Every site and place mentioned in Scripture, together with its modern name, and other circumstances connected with it, should be determined, as accurately as possible. I have seen enough in my journeyings through these interesting parts of Eastern travel, to convince me that we know comparatively little respecting them, and that an important service will be rendered to biblical literature by those who shall undertake, and fully execute, the task. Every spot, and every valley and mountain throughout the whole district of Sinai, will yield a rich and abundant return to the geologist, the antiquary, and the biblical scholar; for, notwithstanding all that we know of this tract of country, it is now only partially known, and has never, I believe, been accurately explored.

"The accomplished and accurate writer on Egypt, Sir Gardner Wilkinson, was going, it was said, to Palestine about two years ago, to make a trigonometrical survey of the Holy Land, but a severe illness, which he experienced at Paris, obliged him to return; and this object remains at the present time unaccomplished. This interesting portion of the globe holds out, one would imagine, sufficient inducements to excite the zeal, and reward the energies, of those whose abilities and diligence shall enable them to do justice to it.

"No dangers need deter amateurs or Bible-Christians from this interesting enterprise, for I feel assured the Pasha of Egypt would give them every facility and assistance; and I should recommend that an application should be made to the pasha, that some of his scientific young men, who speak an European language, should be associated in the undertaking. I will conclude with one other remark, which is this, that it will be desirable in every instance possible, to obtain the Arabic names of places and of things correctly written in the Arabic character."

#### Riddles for Naturalists.

What animal most resembles an eldest son?—The hare (heir).

In which species of birds does the most striking resemblance to dogs exist?—In the hawl (owl).

What aquatic bird did Othello resemble?—The moor-fowl.

What bird is like a sportsman making a repast upon turnips?—Flicker.

What bird is most like a coward?—The quail.

Which of the feathered tribe cannot be purchased for a sovereign?—The guinea-fowl.

If the coal-pits at Newcastle were gifted with speech, what bird would they represent?—The pretinole.

Which birds assisted us to form our alphabet?—The jays and hens.

What part of a lecture is an old woman kissing her cow like?—The slubhouse.

#### LITERARY NOVELTIES.

In the Press.

A new edition of the late Dr. Wüllich's Domestic Encyclopedia, edited by his son.

#### LIST OF NEW BOOKS.

Travels in the West: Cuba, with Notices of Porto Rico and the Slave-Trade, by D. Turnbull, 8vo. 15s.—*Icones Plantarum*; or, New and Rare Plants, by Sir W. J. Hooker, Vol. III. 8vo. 38s.—*Remarks on the Difficulties of Commuting Manorial Rights*, by R. Bray, Esq. 12s.—*Treatise on the Causes and Consequences of Habitual Constipation*, by J. On the 20th, and two following days, generally overcast, small flakes of snow falling occasionally; on the 23d, and two following days, generally clear; the 26th, overcast. The barometer has not been so high as on the 25th since the 20th of October, 1837.

Edmonton.

CHARLES HENRY ADAMS.

#### TO CORRESPONDENTS.

"H." asserts that he is "no painter;" we firmly believe him. He has also shewn us, by what he is pleased to call "occular demonstration," that he is no scholar. What is he then? Judging from the uncivil and unprovoked tone of his reply, we guess; but we are too courteous to—

"give our worst of thoughts  
The worst of words."

*Royal Society*.—In our No. 1304 we noticed that the noble President, the Marquess of Northampton's first evening party for the season would take place this evening. Those who enjoyed those delightful assemblages last year are not likely to forget a circumstance which promises so much of instruction and pleasure.

Report of the Geological and Geographical meetings postponed till next week.

We feel much obliged to the Editor of "The London and Westminster Review" for the engravings designed for stamp letter-covers, which enrich their new Number. They appear to us to be beautifully executed, wonderfully minute, and very difficult of imitation. The price also, is inconceivably small.

*Artemise: French Voyage*.—Reports from M. Laplace of 21st June and 15th July, have been received by the Minister of the Marine. He has entered into treaties with the King of Otaheite favourable to French commerce, and a Roman Catholic chapel was erecting at Honorara. On the 20th July, the Artemise was to sail for the coast of California, and thence visit Guayaquil, Lima, Valparaiso, and double Cape Horn in the fine season, so as to reach France about April.

*Subscription Library*.—We have seen, with satisfaction, the prospectus of a new subscription-library, on an extensive scale, and with an excellent arrangement, to meet the wants of a reading public. A number of subscribers have already come forward, and when 500 at three guineas per annum are enrolled, the establishment is to be formed. Messrs. Ridgway in Piccadilly, and Mr. Fraser in Regent Street, are referees for necessary information.

No. 1. of *Political Philosophy* (Introductory Discourse), appears to us to be very judicious and temperate; and we look forward to the succeeding numbers with hopes of a "Useful Knowledge" and popular publication.

## ADVERTISEMENTS.

Connected with Literature and the Arts.

## BRITISH INSTITUTION,

PALL MALL.

The Gallery for the Exhibition and Sale of the Works of British Artists is open daily, from Ten in the Morning until Five in the Evening.

Admission, 1s. Catalogue, 1s.  
WILLIAM BARNARD, Keeper.

## HORTICULTURAL SOCIETY OF LONDON.

THREE EXHIBITIONS will take place at the Garden of the Society at Turnham Green on the following Saturdays, namely, May 16th, June 19th, July 4th. Fellows may obtain Twenty-four tickets each, for the admission of their friends, at this Office, price 3s. 6d. each, on or before April 7th, on which day the subscription books for such tickets will be absolutely closed; and any Number price 5s. each after that day. All tickets issued at the Garden will be charged 10s. each.

21 Regent Street.

## BIRMINGHAM AND EDGBASTON PROPRIETARY

Principal.—John Ryall, Esq., LL.D. of Trinity College, Dublin.  
Classical Master.—Rev. C. H. Maturin, M.A. Senior Fellow of King's College, Cambridge.

Commercial Master.—Mr. F. B. Ribbans, F.S.A.  
French Master.—Messrs. Abilens, of the University of Paris.  
Assistant Classical Master.—Fr. Ribbans, Jun., of Trinity College, Dublin.

Assistant Mathematical Master.—Mr. Atkinson.  
Drawing taught by the Commercial Master; Singing by Mr. T. Munden; and Dancing by Mr. Parker.

THIS SCHOOL has been established by a body of Proprietors, in order to provide for their Sons a liberal Education, in which the advantages of a Classical and a Commercial School should be combined, and from which the objectionable and degrading system of corporal punishment should be excluded.

The Shares are 50l. each, and may still be had of the Committee. The possessor of one Share has the privilege of sending any number of his own sons, or of nominating one pupil, not being his own son. Persons not Proprietors must obtain the nomination of a Proprietor, who has not used his nomination for his own family.

The charge for each Pupil is 15l. per annum, for instruction in all the usual branches of a Commercial education, together with Greek, Latin, Mathematics, French, Drawing, Singing, and Dancing, including Stationery and Drawing Materials, but not printed Books.

Pupils may dine at the School (five days per week), on payment of 8s. per annum.

The Rev. C. H. Maturin and Mr. F. B. Ribbans receive Pupils of the School as Boarders; Mr. Maturin at 45l. per Annum for Boys above Twelve Years of age, and 40l. for Boys under that age; and Mr. Ribbans at 40 Guineas per Annum for Boys above Twelve Years of age, and 35 Guineas for Boys under that Age. The Committee have great pleasure in making public the following extract, from the Report of Dr. Jerrard, who conducted the first General Examination of the School in September last:—

"From my previous knowledge of the character of your Principals I felt very confident that in any institution placed under his superintendence there would be much that was excellent; but I must say that the actual state of the School, within the short period of a year and a half from the time of its first opening, more than realised the expectations which I had formed. The performance of each of its pupils is rarely to be met with in boys of their age, either in the public or private schools of this country. And these observations I by no means confine to the clever boys: what I chiefly speak of is the general average of attainment, which struck me as being unusually high, and as affording proof, not only of the sound and philosophical nature of the method of teaching employed, but also of extreme pains and persevering industry on the part of the masters."

The Second Quarter of the present year will commence on Monday, April the 6th.

Every information may be obtained on application to the Honorary Secretary, Bennett's Hill, Birmingham.

J. C. BARLOW, Honorary Secretary.

Committee Room, Edgbaston, Feb. 20th, 1840.

## BARNABY RUDGE.—An Advertisement

Having appeared, signed by Messrs. Smithson and Mitton, Southampton Buildings, announcing that Mr. Charles Dickens is not at present engaged upon the work under the above title, it is necessary, in justice to Mr. Bentley, to state, that by an agreement, under the hand of Mr. Charles Dickens, dated in February last, Mr. Dickens agreed to write the above work for Mr. Bentley, to be completed and delivered to him by the first day of January next; and also engaged not to commence or write any other work until the same should be completed, except "Nicholas Nickleby," which is completed, and an annual publication, in one volume, which has been abandoned, and a book to be published by Mr. Colburn, and edited by Mr. Dickens, which has been published, and that up to this time Mr. Dickens has not expressed his intention to refuse to perform his agreement by writing the work in question.

ADLINGTON, GREGORY, FAULKNER, and POLLETT, Bedford Row.

I certify the facts above stated to be true.

JOHN S. GREGORY, Bedford Row.

Feb. 24, 1840.

## TO BOOKSELLERS AND OTHERS.—

Caution.—An Injunction having been obtained against certain parties for selling in the English, French, and English and French Dictionary, Bookellers and others are Cautioned not to purchase, sell, or offer for sale, any such foreign edition, as immediate legal proceedings will be taken against any party so offending.

By Order of the Court, WHITTAKER and Co.

Ave Maria Lane, London, Feb. 27th, 1840.

## ART-UNION.—The Subscription Lists for

the current year will close in time to give the Prize-holders an early Selection from the Works in the Exhibitions of the Royal Academy, of the Society of British Artists, and of the Societies of Painters in Water-Colours; and before the closing of the British Institution. Subscriptions are received, and Prospectuses may be had, at the London and Westminster Bank, 38 Throgmorton Street; and at the Branch Offices of the same, 9 Waterloo Place, Pall Mall, 155 Oxford Street, 213 High Holborn, 12 Wellington Street, Borough, and 57 High Street, Whitechapel; by Messrs. H. Colnaghi and Co. Pall Mall East; by Messrs. Colnaghi and Puckley, Cockspur Street; by Mr. R. Jennings, 62 Cheapside; by Mr. Thomas Brittain, Collector, 17 Southampton Place, Kuston Square; and by any Member of the Committee.

## ART-UNION.—The Subscribers of the

year 1839-9 are informed that, for each Guinea subscribed, they will receive, in August next, an impression from an Engraving by Lucas, of the Picture by F. R. Lee, R.A., purchased by the holder of the price of £150.

**MISS PIGOTT'S NEW WORK.**  
**RECORDS of REAL LIFE.**  
By Miss H. PIGOTT.  
Revised by the late JOHN GALT.  
"Mr. Galt adopted Miss Pigott's MS. with intense interest. The preface and notes were the last efforts of his mental powers."—*Introduction*.  
The author having moved in the best circles of society, and travelled all over the Continent, has in these volumes presented us with many pleasant reminiscences of her sojourn and associates, forming a miscellany in the way of light and polite literature which we can safely recommend to the upper classes for their entertainment. —*Literary Gazette*.  
Saunders and Otley, Publishers, Conduit Street.

In 2 vols. post 8vo.  
**THE REAL and the IDEAL; or, Illustrations of Travel.**  
"The author appears to have fused down whole volumes of notes and journals into these pages, in which he not only passes in review all that he has seen or heard among the scenes in which he has moved, but supplies from the stores of a graceful and accomplished mind every thing which could be expected to illustrate the subject of his criticism. He has given, in fact, a sort of philosophy of travel."—*Novel and Military Gazette*.  
Saunders and Otley, Publishers, Conduit Street.

**REV. C. GIRDLESTONE'S SERMONS.**  
**A COURSE of SERMONS for the YEAR.**  
3d edition, 2 vols. 12mo. 14s.  
1. The First Series of Twenty Parochial Sermons, with an Appendix, containing Parochial Papers. 3d edition, 12mo. 5s.  
2. The Second Series of Twenty Parochial Sermons, adapted to the Use of Families. With an Appendix, containing Helps for Family Devotion. 3d edition, 12mo. 5s.  
3. The Third Series of Twenty Parochial Sermons. (For particular Occasions.) 12mo. 5s. 6d.  
4. Farewell Sermons, preached in the Parish Church of Sedgley. 12mo. 4s. 6d.  
By the Rev. CHARLES GIRDLESTONE, M.A.  
Rector of Alderley Church, Cheshire, and Waterloo Place, Rivingtons, St. Paul's Churchyard, and Pall Mall.

**THE PENNY SUNDAY READER.**  
The Tenth Volume (for July to December, 1839), price 9s. 6d. in cloth boards.  
This Work is continued in Weekly Numbers, and forms a cheap Manual of Sunday Reading, adapted to the sacred character of the Lord's Day, especially connected with its devotional offices. It contains also, Miscellaneous Papers, Sacred Poetry, original and selected, choice Extracts from eminent Divines, and Communications from Correspondents.  
Rivingtons, St. Paul's Churchyard, and Waterloo Place, Pall Mall.

\* The Volumes of this Work are included in the List of Books recommended by the Society for Promoting Christian Knowledge.

**THE TOURNAMENT at EGLINTOWN CASTLE.** Dedicated to the Earl of Eglington.  
"As a representation of the most splendid and chivalrous exhibition which modern times have produced, it is deserving a place on the drawing-room table of every man of taste and gallantry in the kingdom."—*United Service Gazette*.  
London: Hodgson and Graves, Pall Mall.  
Price 3l. 3s. Plain; Beautifully Coloured, 4l. 4s.

8vo. price 12s. illustrated with 320 Woodcuts.  
**ELEMENTS of NATURAL PHILOSOPHY,** being an Experimental Introduction to the Study of the Physical Sciences.  
By GOLDING BIRD, M.D. F.R.S. F.G.S.  
Lecturer on Natural Philosophy at Guy's Hospital.  
"This work teaches us the elements of the entire circle of natural philosophy in the clearest and most interesting manner: high as the subjects of dynamics, meteorology, electricity, &c. are set before us in such simple forms, and as forcible a way, that we cannot help understanding their laws, their operation, and the remarkable phenomena by which they are accompanied or signified. As a volume of useful and beautiful instruction for the young, and as a work of general value to both sexes, we cordially recommend it."—*Literary Gazette*, December 7th, 1839.  
London: John Churchill, Princes Street, Soho.

**GLIMPSES of the OLD WORLD; or, Excursions on the Continent, and in the Island of Great Britain.**

By the Rev. J. A. CLARK,  
Rector of St. Andrew's Church, Philadelphia, United States.  
2 vols. post 8vo. 14s. cloth, lettered.  
"There is a high moral and intellectual bearing in the entire performance, worthy alike of the scholar and the divine. Full every successive sketch, on whatever subject it touches, is animated and lively in the extreme, rendering it next to impossible to lay aside the work until every page has been devoured."

Also, by the same Author, lately arrived from the United States,  
**THE CHRISTIAN KEEPSAKE.**  
This elegant Volume is edited by the Rev. J. A. Clark, and contains a variety of deeply interesting contributions from the pens of the first American Authors. It is embellished with many beautiful Engravings. 15s. Morocco elegant, gilt leaves.

**ROME, its WONDERS, and its WORTH.**  
SHIP. A Narrative of Scenes which passed under the eye of the Rev. J. A. Clark, during his late visit to that City. Extracted from "Glimpses of the Old World."  
1 vol. 12mo. 2s. 6d. cloth, lettered.

"A little work unfolding scenes of deep interest. Mr. Clark proceeded to the eternal city, where he resided long enough to enable him, with his keen observation, vivid pen, and historical, classical, and other knowledge, to furnish one of the most interesting sketches of all that pertains to its present and past history, that has seen the light in this or any other country."—*Evangelical*.  
Samuel Bagster and Sons, Paternoster Row, London.

KEITH'S MEASURER, ENLARGED BY MAYNARD.

and Co.); L. A. Lewis, 125 Fleet Street.

Printed by HANNAH PAGE MOVES, of Brook Green, Ham-  
mersmith, and GEORGE BARCLAY, of Number 2 Pullin's  
Place, Islington, both in the County of Middlesex, Printers,  
at their Printing Office, Number 21 Castle Street, Leicester  
Square, in the said County; and published by WILLIAM  
ARMISTEAD SCRIPPS, of Number 18 South Molton Street,  
in the Parish of Saint George, Hanover Square, in the County  
aforesaid, at the LITERARY GAZETTE OFFICE, Number  
7 Wellington Street, Waterloo Bridge, Strand, in the said  
County, on Saturday, February 28th, 1860.

### REVIEW OF NEW BOOKS.

*Letters of the Earl of Dudley to the Bishop of Llandaff.* 8vo. pp. 384. London, 1840. Murray.

A VOLUME of more interesting character has not in our day issued from the press, whether we look at its sketches of contemporary men and events, the ease and gracefulness of its style, the variety of the subjects on which it touches (all of them such as the world likes to read about), or the independent tone of mind and enlightened views, which lend a superior value to the whole. Here the scholar is charmed with classical remarks, the politician informed on points of much national importance, and throughout there is a degree of intelligence and frankness, the essence of familiar and friendly communication, which brings this correspondence into no invidious comparison with the most popular of the writings of Horace Walpole. Such being our opinion of the volume, we should be sorry to detain our readers from such a notice of it, taken from itself, as our skill and judgment may supply.

From December 1799 to February 1831, the Bishop of Llandaff corresponded on the most intimate terms with the late Lord Dudley; and the present selection of letters is between the dates of January 1814 and January 1823, when Mr. Ward succeeded to his father's title. Another volume is conditionally promised; but it seems that, besides burning his lordship's papers according to his direction, his executors have thrown some obstacles in the way of publishing such letters as he addressed to others. If, however, the same delicacy and discretion are observed by those as have been observed by the Bishop of Llandaff, there need be no opposition to the giving of his manuscripts to the public; and we sincerely hope there will be none in this particular instance.

In some of the earlier letters the writer speaks very freely of the hostility to salutary change shown by churchmen resident at Oxford, but as he afterwards qualifies these observations we shall not go partially into the question. By and by we shall select his opinions of a number of celebrated persons; but, in the first instance, follow the outline of his course. In 1814 he went to Paris, when in possession of the Allies, and afterwards visited it again and again; and he did also Italy, Germany, the Low Countries, and other parts of the Continent, upon which his remarks are extremely lively and pertinent. Thus at Paris, at the time we have mentioned, he says:—

"There is a congress of ambassadors here to negotiate a peace. I have no doubt but that the interests of England will be well taken care of by Lord Castlereagh. I have heard but one opinion as to the firmness and ability with which he conducted himself in all the late transactions. His arrival at head-quarters was most critical: but for that, the spirit that dictated the foolish declaration of Frankfort (that which Whitbread so much praised), would probably have prevailed, and Buonaparte would still have inhabited the Tuileries. The details relative to that extraordinary man's late journey to Fréjus are, of course, known in

England through the papers, long before this. They are really most singular. It is perfectly true that he expressed a strong wish to make England his asylum; and even yet, I understand, he has not wholly laid aside the idea of ultimately retiring there. Lord Aberdeen (who, by the by, has been all this while filling a most agreeable and interesting, as well as most honourable station) told me a trait yesterday, which I think highly illustrative of the French character. He had just been conversing with Ney, who had talked about the projected invasion of England in the late war. Ney declared that he had always been an advocate for the enterprise, and that he was still of opinion that it must have succeeded, and that England must have shared the fate of the rest of Europe. The Emperor, he owned, had never been so sanguine, but had treated it as an undertaking more fit for a partisan than a general; but that, notwithstanding this great authority against him, he still adhered to his own original judgment upon the design. The place where Ney chose to volunteer uttering this opinion was at Lord Castlereagh's table, and in the company of eight other officers, some English, some Russian, and some German, all of the dignity of marshal, and by all of whom the French had, at sundry times, been signally defeated."

Elsewhere he speaks of Napoleon in these terms:—

"It is quite idle to talk of want of personal courage in Buonaparte. He was constantly exposed to fire in the last campaign, and shewed throughout the most perfect coolness and bravery."

From Rome, on the descent from Elba:—

"They say here now, what I find they said in England two months ago, that Murat is about to take possession of Rome. I fancy the fact is, that he is advancing his troops to the frontier, in order to be ready for whatever may happen; but I have no notion that he will actually invade the ecclesiastical state till he has certain intelligence of his brother-in-law's success. In the meantime, Buonaparte's landing in France has struck great terror into the government here. They already talk of the pope's retiring to Civita Vecchia. If the French army goes over to Napoleon, and the nation with it (which I reckon would be quite a matter of course), I see no bounds to Murat's ambition in Italy. He will have a clear stage to fight it out with the Austrians; and I am told they have just given him a very good reason for declaring war against them, by deserting him at the Congress, after repeated assurances of support and friendship. It will be no hard matter to drive them out, as they are hated beyond measure both in Lombardy and the Venetian States."

"I should like to know what effect this event has produced upon your mind with reference to the character of Buonaparte himself. I confess it has raised him very much in my opinion, and that, not merely because the common weakness of human nature inclines one to admire success, but because I think I see in it the triumph of skill, fortitude, discretion, foresight, and courage. With what profound dis-

simulation he concealed his design—with what promptitude and intrepidity he carried it into effect! What will now be said by those that thought he ought to have put a pistol to his head rather than sign the Articles of Fontainebleau? What has now happened serves to explain some parts of his conduct which were made subjects of criticism and even of ridicule—his retaining the title of emperor, and along with it a certain state which seemed not to belong to an exile in Elba—his choice of that island for his place of his retreat, and the care with which he kept together and exercised that handful of followers who were to protect him at the outset of the enterprise which he already meditated. The Russian campaign was a great blunder, and a blunder made more conspicuous by ill-fortune; but he has atoned for it with admirable ability; and what must be that military fame, and that art of gaining the attachment of the army, which in spite of the most disastrous campaign known in history,—which in spite of abdication and exile, rendered him, as much as on the day after the battle of Austerlitz, the idol of every soldier in France. He is an antagonist, a contemporary, and a Frenchman—all things we are naturally disposed to hate; but the fair way to judge of his actions is to consider what we should think of them if this had happened two thousand years ago in Plutarch's 'Lives.' I really believe we should place him quite as high as Cæsar or Alexander, perhaps higher. Such a recovery is without example, so far as I remember. Take notice, that when I praise Napoleon, I am not speaking of moral qualities. I consider him merely as a Statesman and a General."

Of Talleyrand at the restoration:—

"Talleyrand is a great rogue, but he is a rogue of long experience, and of singular ability in the conduct of public affairs; and he is bound to the present order of things by the only sure tie, his own interest. He cannot hope to go higher than to be first minister of France, under princes who, though not by any means deficient in understanding, are not possessed of any remarkable talents. The steady friends of the ancient government cannot but dislike him; however, the nobility may, perhaps, derive some comfort from recollecting that at least he is not an upstart."

When Louis XVIII. gave the charter:—

"While all this was going on, I was chiefly employed in watching the countenances of the marshals. Marmont seemed pleased with his own appearance (and to do him justice, he is a very handsome, manly-looking fellow), and satisfied with the price of his treason to a master, one of whose few weaknesses it was to have shewn towards him favours far more than proportioned to his merits."

"London, June 13, 1814.

"I was interrupted, and as I left Paris a few days after I began this letter, I thought it better to finish it here. I was going on to speak of the marshals. Except Marmont, none of them looked in good humour. Soult, who has naturally a stern, ill-favoured aspect, was particularly gloomy. He is known to be extremely ill-affected to the present govern-

ment, acquiesced under it slowly, and with great reluctance, and is suspected of having been already informed of the events that rendered the battle near Toulouse unnecessary before he fought it. He is, I believe, considered by the English army as the ablest and most intrepid officer to whom they have ever been opposed; but his disloyalty is the less to be dreaded, because he is not loved by his own troops."

We seem to have got among the anecdotes sooner than we expected, and shall make no excuse for putting them together. Of W. Gifford, the editor of the "Quarterly," to which Lord D. was a contributor, he does not speak so highly as we would have expected. He says of an article on Miss Edgeworth:—

"Gifford has got it. What he will propose to alter I know not, nor do I much care, provided he suffers me to make them myself, and does not insert any thing of his own, which is, generally speaking, not good for much. His prose is remarkably inferior to his poetry. I was preparing to make a vigorous defence of Miss E. from the canting, hypocritical accusation against her on the score of religion, when luckily I bethought myself of turning back to the two former papers on Miss E. in the Q. R., in which I found this charge preferred with great earnestness and solemnity. Both the critiques are wretched, and I should not the least have minded contradicting flatly any doctrine, literary, moral, or religious, contained in them, had I not, just at the same time, to my great surprise, accidentally learnt from Murray (who told it me with a mixture of lamentation and contempt, comical enough for such a personage) that these passages were of Gifford's own manufacture, and inserted (*pro salute animæ*) at his particular instance in an article furnished by that 'serious young man' the younger Stephen."

Of Byron:—

"Lord Byron has written another poem, which I have seen. It is very beautiful; but I doubt whether you would be inclined to shew any mercy to its great and palpable defect—the repetition of the same character. Lara is just the same sort of gloomy, haughty, mysterious villain as Childe Harold, the Giaour, the Corsair, and all the rest. This is a strange mixture of fertility and barrenness. One would think it was easier to invent a new character, than to describe the old one over and over again. I have not read Bertram, nor shall I ever read it. If it is only an attempt to dramatise one of Lord Byron's villain characters, or rather Lord Byron's villain character (for he has but one, though all the portraits he has drawn of it are fine and interesting, notwithstanding their resemblance to each other), it is not likely to possess much merit. Lord Byron's subject is nothing, and worse than nothing without Lord Byron's genius to adorn it, which it is not very likely his imitator should possess."

Of Wellington at Waterloo:—

"After the battle the duke joined in the pursuit, and followed the enemy for some miles. Colonel Hervey, who was with him, advised him to desist, as the country was growing less open, and he might be fired at by some stragglers from behind the hedges. 'Let them fire away, the battle is won, and my life is of no value now.' *Vox magnifica, et tanto viro digna, quæ se non sibi, sed reipublicæ soli natum esse professus est.*"

Of Canning (Paris, April 2d, 1816):—

"It was amusing enough to see the effect of the defeat of our ministry upon the question of

the Income Tax produced upon the minds of the people here. Most of them thought that the government would be changed, and that the Whigs would come in, and probably let loose Napoleon to disturb the world for the third time. If I had been in the House, I should have voted in the minority, and yet I confess I am not sorry it was a minority. Not that I am by any means convinced that the Income Tax ought to have been repealed, but because I think the ministry wanted beating upon something, no great matter what. Their prodigious success—which, without at all meaning to deny their merits and abilities, must be allowed by all reasonable men to have been vastly beyond their merits, and beyond their abilities—had made their underlings insolent, and the House too obedient, and a blow of that sort was necessary to remind the servants of the country that they are not its masters, and to give back to the constitution that spirit and activity which it was, perhaps, beginning to lose. They seem to have cut a miserable figure in the debate, and the consciousness of their deficiency in so essential a particular, will probably contribute very much to bring about an agreement with Canning; on such terms as it will be honourable to him to accept. On this subject it was quite ludicrous to hear the language of their supporters some time ago. They wondered 'what use he could be of, and why Lord Liverpool could have thought of making any terms with him.' The debates of this session may, perhaps, have enabled them to form some guess as to what is the use of the greatest speaker in either house of parliament in carrying on a government with credit and ease. You speak of a system of national education, and several other important objects that require attention, but you cannot expect any great measures of improvement from an administration which is only just able to keep itself afloat.

"I am hardly recovered from my delight at the splendid victory he (Canning) gained the other evening." It was certainly the greatest effect, without any exception, that I ever saw produced by a speech in parliament. It is confessed to have been so even by his enemies. I do not believe there is any instance upon record of a man having done so much by a single effort to redeem and raise his character. The whole load of obloquy seems shaken off at once; and his prodigious abilities are now left free to carry him to his natural elevation. He is quite a new man. His influence in parliament is at least double what it was on Monday last. Some of the opposition behaved very well; not only Lord Milton, who spoke, but Lord Tavistock, who went away, which was really all one could expect from the chief of the house of Russell on such an occasion. Others behaved just as ill. Mackintosh and Sharp are the persons with whose conduct I see most reason to find fault. But that is between ourselves; for having contained my indignation at the time (though with difficulty), and having seen them both since with an unaltered countenance, I do not now mean to say any thing about the matter. We had an excellent anti-Catholic speech from Peel last night; really quite capital. He said all that could be said on that side, and said it as well as possible."

[What is stated of the votes of Sir J. Mackintosh and Mr. Sharp we can, were it needful, corroborate. The morning after the debate Mr. Canning declared to us, that his feelings

"On Mr. Lambton's motion respecting Mr. Canning's embassy to Lisbon. The motion was negatived by a majority of 270 to 96."

were more hurt by their voting against him than if there had been a majority of the House on the same side.]

"Dresden, August 1817.

"Your letter of the 21st July followed me here. One from an opposition friend, which came to hand at the same time, confirmed to me your account of the great success of Canning's last speech. It would have been worth my while to stay in England to hear it. His superiority over Brougham will, I presume, be scarcely contested any longer, even by the Reformers."

"London, December 1819.

"I am really obliged to you for the kind way in which you have taken my last letter, and for being persuaded that if I declined interfering in behalf of your friend, it was only because I really thought that I could not take any steps in his favour with propriety or effect. Mr. Grey's merits as a professional man will, I am confident, have their due weight with Canning. He probably takes for his principle in the exercise of patronage the '*inter dignos detur amicissimo*,' but I am deceived in him if in so important an appointment he would not limit his choice to the '*digni*.'"

Of Sir R. Peel (already spoken of):—

"There is no judging very well about what passes at home unless one is on the spot; but it seems to me that opposition is not strong enough to come in, and 'the ministry' is too weak to govern. Van will, I suppose, be turned out, and replaced by Peel. But I doubt whether that will be sufficient to set the government upon its legs. Peel has no doubt a very good understanding, and perfect discretion, but still I cannot help suspecting that whenever he comes into very high office, it will be found that he has been over-rated."

"After what I said to you of Peel's defeat last session, I should be unjust if I did not own that what he has done in this has been creditable to him. He has spoken twice. The first speech was the longest and most elaborate; but the second, as far as I am able to judge, shewed most power of the two."

Sir W. Scott:—

"What a happy genius that of Walter Scott! When a man can do great things only at the price of severe incessant labour, I don't know that he is much to be envied. It is almost sure to spoil his stomach and his temper, and to make him pass many dismal hours. The case is still worse where great talents are combined with a frantic misanthropy like that of Rousseau and Byron. But it is hardly possible to conceive a more fortunate mortal than him that is possessed of such powers, along with such felicity in the exercise of them, and who unites the finest genius to a cheerful, social disposition, and an undiminished relish for the pursuits and amusements of ordinary life. He is a great poet, grafted upon the excellent stock of a good-natured, lively, active, reasonable, companionable man. As to Byron, his finest fruits savour of the parent crab, or rather the noxious upas of his pride and malevolence. You know how late Scott's talents were in developing themselves. He was eight-and-twenty years old. I happened to be in Scotland when he stumbled upon this great genius,—just as a man finds a treasure buried in his garden, or a gold mine upon his estate. He has lived upon it jollily ever since, and scattered his dead and over the world. I have only begun Hallam's book. I fancy it is extremely well done, and highly valuable; but the chapter upon the feudal system, where I am yet sticking, is rather dry. He writes rather like a

man who holds those readers cheap that expect to be amused as well as instructed."

In other places the writer expresses his admiration of Mr. Hallam, and also praises Lord Ripon, Mr. Bankes, Mr. Talbot (of Wiltshire), and others; and it should be observed, that all these opinions refer to the earlier days of the individuals, whose abilities, twenty or five-and-twenty years have since done much to develop in higher positions.

Of Rogers:—

"I found Rogers's poem one day upon somebody's table. I had time to read about 130 lines. Some of them I thought very beautiful, and a great many I did not understand. Lord Byron's obscurity seems to be contagious, as the defects of a great man generally are."

Of Campbell:—

"Lady Davy wrote to me this morning to ask me for an introduction to you for Campbell the poet. Such a request might very well have proceeded immediately from himself, for I have known, admired, and esteemed him for the last two-and-twenty years. I should not scruple to make such a demand upon your kindness in favour of a less eminent person. But then a longer letter would be necessary than the few minutes I now have to spare would allow. Campbell's fame renders superfluous a great part of what it is usual to say upon such occasions, and you will probably not be sorry to become acquainted with the author of 'Hohenlinden.' For some years past I have hardly seen him at all, but unless he is much changed, you will find him a man of pleasing and animated conversation—modest and unassuming almost to a fault. I think I have heard him reproached with affectation, but I believe it is nothing but embarrassment resulting from a very delicate and sensitive frame of mind. To me he always seemed quite natural. You are probably a good deal occupied at this time; but if you can take any opportunity of being civil to him, you will oblige me at the same time that you do him a kindness."

Of Mackintosh:—

"Your praise of Mackintosh's papers in 'The Edinburgh Review' is liberal, but not excessive. I told him yesterday how much you liked it, with which he seemed pleased in no common degree. He is so good-natured a man, so kind in his encouragement of others, that one has a double satisfaction in rendering due homage to his genius and acquirements."

Of Brougham:—

"At half-past twelve to-day, Brougham concluded a most able speech with a magnificently eloquent peroration. The display of his power and fertility of mind in this business has been quite amazing, and these extraordinary efforts seem to cost him nothing. He dined at Holland House yesterday, and stayed till eleven at night, talking 'de omni scibili'—French cookery, Italian poetry, and so on."

Of Plunkett:—

"The anti-Catholics have but one advocate, and he so completely overmatched by his chief opponent that hardly the appearance of a struggle is maintained. I wish you had heard Plunkett. He had made great speeches before; but in this he far surpassed them all. I have not for many years heard such an astonishing display of talent. His style is quite peculiar; for its gravity and severity, I prefer it to all others of which I ever heard a specimen. If he had been bred in parliament, I am inclined to think he would have

been the greatest speaker that ever appeared in it."

Of Hume:—

"Opposition, led by Mr. Hume! is become quite despicable. The degradation of one side produces slovenliness on the other, and hitherto the houses have produced very little indeed of which an Englishman can be proud."

Of Burdett (the queen's trial):—

"She seems to have been advised by persons that are resolved to play the deepest possible game, and care little to what risk they expose her, provided they have a chance of turning out the government; or, perhaps, of overthrowing the monarchy. I do not believe that it is Brougham's doing. I think too well of him to suppose that he would give such bad advice to his client for the mere chance of doing mischief. But it is said that Burdett and Hobhouse have had access to her, and they perhaps have been less scrupulous, or at least less judicious. It was quite evident, from the turn of Burdett's speech (a speech, by the by, as able in its execution as it was pernicious in its tendency), that this is the advice, which, if consulted, he would give."

Of the queen herself:—

"There are many persons of opinion that there are circumstances in the king's conduct towards her, which render any inquiry into her chastity necessarily unjust. The cause of morality may suffer by her impurity, if guilty; but, on the other hand, may it not be said, with great colour of reason, that nothing can be more essential towards upholding one of the two pillars upon which human society rests—marriage (property being the other), than to teach husbands, of whatever class, that wives must be treated, if not with kindness and affection, at least with forbearance and discretion—that they are the proper objects of care and salutary control—and that the law outsteps its just functions when it interferes to punish misconduct that has been provoked by outrage, and facilitated by neglect? The guilt of adultery is greatly aggravated by the mean condition of the person with whom it has been committed; but you will hear from her advocates, that it is no wonder if she became familiar with low society, since the whole influence of the English crown was employed by her husband and her kinsman to drive her from that which became her birth and station. In short it is a very thorny question, and made to try men's wisdom as well as their courage."

[To be concluded next week.]

*Aphorisms on the Treatment and Management of the Insane; with Considerations on Public and Private Lunatic Asylums, pointing out the Errors in the Present System.* By J. G. Millingen, M.D. (author of many valuable medical and other works.) 18mo. pp. 202. London, 1840. Churchill.

WE feel that an author is not afraid to grapple with his subject when he sets out to expound it with "aphorisms." There is no verbiage, no long-spun argumentation, no shuffling or shirking with them; and if the writer has not a great mass of skill and experience, he had much better burn his fingers than take his pen with them to venture on these pithy sentences. Dr. Millingen had no cause to fear; and five hundred and three aphorisms bear testimony to his knowledge as regards insanity, his intelligence in observing all its forms and symptoms, and his clear views of the modes of treatment, and best methods of cure. This is a small but valuable volume; and it calls attention to a matter than which

there is none other more interesting to humanity. The disease is a frightful one; and ages have passed over generations of men and women without its being sufficiently investigated or understood. In later day some steps have been taken towards the remedy of this crying evil; but much, very much yet remains to be done; and with such a guide before us, we trust it will not be long before that great desideratum is partially, if not wholly accomplished. That we have hitherto been as much misled as enlightened on the subject by legal inquisitions, conflicting medical authorities, and published theories, is notorious to the world, and well does Dr. Millingen remark, "Numerous works have been written on mental diseases, yet are they rarely read, excepting by those medical men who are more particularly engaged in the treatment of these affections, and unfortunately even by them with very little advantage. Several of these publications are only remarkable for their authors' ingenuity in metaphysical disquisitions and inquiries into the causation of causes, wandering through the intricate mazes of an interminable labyrinth, to materialise the mind. Other treatises are merely verbose prospectuses of private establishments, and contain an *ad captandum* collection of cures."

As neither fifty dark lanterns nor fifty Wills-o'-the-wisp can make an illumination, so neither can a hundred such lights as these shew us the way we ought to go. And our author proceeds:—"The science of 'mad doctors' seems to consist in the art of obtaining as many patients as they can in private asylums, and to keep them as long as possible. In public establishments, where numbers do not yield any profit, the unfortunate incurable Toms o' Bedlam are discharged upon the world to commit murder or arson, or amuse the rabble, until elsewhere provided for in this world or the next. Of those who perish in these bastilles so little notice is taken, that in a late investigation of one of our most renowned asylums, it appeared that only 221 cases of death had been reported, whereas 364 patients had been relieved by death, in their *oubliettes*. It was on this occasion that a medical gentleman deposed, 'that when a patient disappeared and was never more heard of, he was said to have been removed; and that when a patient was killed, the body was hurried away to prevent a coroner's inquest!!!' In fact, the horrors recorded of the Spanish Inquisition were tender mercies compared to the diabolical crimes perpetrated in mad-houses. In an *auto da fé*, the victim was consumed at once in a blaze—in a lunatic's cell he is consumed by a slow fire. Since these abominations were made known in 1815, no doubt the condition of the unfortunate lunatics has in some degree been ameliorated, inasmuch as these atrocities are only resorted to by stealth, and with some degree of apprehension, where detection is probable; but as, in the present state of lunatic asylums, their detection is not easily obtained, hundreds of unfortunates at this very hour are immured in their dismal prisons, condemned to a moral death in lingering agonies. The criminal, the debtor, the sick, are all protected from oppression. The insane alone, who dares not complain, and whose complaints are considered the ravings of a demented poor creature, has no protection. Prisons are inspected, and placed under a salutary surveillance; the mad-house is only visited as a matter of form, and not unfrequently with apprehension of personal danger! I am well aware that my proposal to place these establishments, whether public or

private, under the immediate control of government, and submit them to the surveillance of responsible officers, will be considered an infringement of rights, of privileges, of patronage.

'The momentary grace of mortal men,  
Which we more hunt for than the grace of God!'

That any attempt to rescue the lunatic from misery will be called centralisation. Nay, if another Howard presumed to visit these abodes of wretchedness and forgotten beings, he would be considered a meddling busy-body."

Notwithstanding these too probable anticipations, Dr. Millingen boldly brings forward the plan which he recommends; and enters into every detail connected with its execution. It is impossible for us to enter upon a full exposition of these, and, indeed, the nature of many of them renders them unfit for popular diffusion; but we select a few of the aphorisms, to exemplify their general appositeness and force:—

"All lunatic asylums, whether public or private, should be placed under the immediate care of government."

"They should be under the control of inspectors, metropolitan and provincial."

"A metropolitan board should be formed of inspectors, a proportion of whom should be medical men, to be placed in communication with the provincial ones."

"Inspectors should be named for every circuit, not less than four in number, and two of them to be medical men."

"The metropolitan and provincial inspectors should have the power of visiting all public and private establishments as frequently as they may think proper, and carefully examining the patients, and ascertaining the mode of treatment adopted."

"Regular reports, at stated periods, should be transmitted to the Secretary of State for the Home Department, to be laid before parliament in duplicate forms. And the commissioners should be held responsible for the proper management of all such establishments, and of the necessity of the seclusion of their inmates."

"No patient should be sent to a public or private institution until the case had been submitted to the inspectors, with proper medical certificates, and the confinement of the lunatic sanctioned by them as indispensable."

"The inspectors should also have the power of discharging those persons whose further confinement they might consider improper."

"In every public and private lunatic establishment, a register and case-book should be kept, in which should be noted the name and age of each patient, with a statement of the nature of the disease; a duplicate of these registers to be in the hands of the inspectors; and all admissions, deaths, and discharges, should be reported to them every month."

"Every public asylum should have an infirmary, to which all the sick should be removed, and the journal of the cases, to be regularly kept by the medical officer, who should also register the *post mortem* appearances."

"No one but medical men should be allowed to keep a private asylum, in which they will be expected to reside. For if there does exist a malady which requires incessant care and observation more than another, it is most unquestionably insanity; when both the moral and the therapeutic treatment must be dictated by studying the nature of the case."

"An annual report should be made by the inspectors of lunacy, presenting to parliament a statistic view of insanity. This report to be drawn out by the metropolitan board, who will

embody the several reports transmitted to them by the county commissioners."

"The importance (adds the author, in a note,) of such inspections for the protection of lunatics is so urgent, that I feel confident the public would never object to the expenses which would be incurred by such appointments. We have inspectors of prisons, whose active inquiries have already been attended with the most beneficial results; why should not unfortunate creatures, who cannot complain, and whose complaints are rarely attended to, be entitled to a similar protection? Let those who might murmur at the expense recollect that Providence may afflict them with a similar visitation, and reflect on all the crimes that have been perpetrated in madhouses! and which (although checked by legislative interference) still exhibit scenes of abuse of power and capricious tyranny, but too frequently abetting sinister projects, of which a poor, demented, unprotected object is the victim!! The good that would result from such a system of inspection, and its consequent responsibility, is incalculable."

Earnestly do we hope that government will take up and act upon these suggestions; civilisation cannot be deemed advanced where such things remain unreformed. We conclude with half-a-dozen specimens of the *Aphorisms* which relate to the disease, which are among the many curious statements of a similar kind:—

"In this series of reacting and conflicting sympathies, the digestive functions appear to be the first that are deranged by mental excitement. Hence the investigations of morbid anatomy in fatal cases of insanity usually exhibit functional alteration in the organs of assimilation. As the mind improves, and recovers more or less promptly its healthy action, we find that the digestive functions become more regular; therefore, excepting in cases of fatuity and idiocy, we may entertain a favourable prospect of speedy recovery when the body from a state of emaciation begins to recover bulk. This is a practical point of the utmost importance in guiding our treatment, and shews the absolute necessity of basing it, to a certain degree, on a careful attention to the digestive organs."

"When intensity of thought has brought on incoherence, such a confusion prevails in the mental impressions, that no distinct recollection appears to exist of former circumstances. Hence the fact, that subjects who have become insane from disappointment in their fondest attachments rarely mention the name of the object of their love. When they do recollect the person's name, and appear to be grieved when it is mentioned, however violent their maniacal outbursts may be, we may entertain the most sanguine hopes of recovery."

"Lunatics rarely become blind, but are frequently affected with deafness. This difficulty of hearing is often attended with a *tinnitus aurium*. However, the deafness is sometimes merely apparent, when the patient fancies he hears strange sounds, admonitions, and threats from unseen agents and spirits; he then is so intent upon listening to these imaginary communications, that he literally turns a deaf ear to all that is said to him. This is a formidable symptom, as the patient will become gradually more and more abstracted from surrounding objects."

"More delusions are conveyed by the ear than by the eye; and of the organs of sense which become affected in insanity, the ear more particularly suffers."

"Peculiar actions, such as constantly drumming upon the table, stamping regularly on the floor, clapping hands, &c., may be considered signs of a rooted disorder and great mental alienation. When insanity has assumed a systematic character, it may be considered most difficult to cure."

"When an establishment contains patients of various conditions of life, the luxuries allowed to the wealthy should never be distributed in the presence of the needy. The insane will not reflect on the difference of their station in life, but will consider themselves entitled to every thing which they see others enjoy. It is therefore obvious that these classes should be kept separate from each other; for not only their dietary, but their dress, will prove the source of much discontent and jealous irritation."

A capital architectural plan of an asylum for 600 patients is an excellent illustration of this excellent volume.

*Memoirs of Madame Malibran.* By the Countess de Merlin, and other Intimate Friends, &c. 2 vols. 12mo. London, 1840. Colburn.

THE memoirs of a Malibran must produce a melancholy impression,—an impression whose sadness is deepened by the lustre of her talents, and the brilliancy of her career. She was a creature too gifted to be happy; too much the being of impulse to have a fair chance among the interested and selfish of this world of ours. An early death was the inevitable accomplishment of her destiny.

What consolation may be derived from tracing her course where thousands and tens of thousands infatuated her with applause, and testified to the triumphs of her genius, will be found in the perusal of these volumes! At fifteen she commenced her theatrical career at Paris, and soon after made her *début* at the King's Theatre, London, where her success was at once complete. But the journals of the time have since then kept her so fully before the public that we shall only select such matters as appear to us to be most characteristic and interesting; such anecdotes as the following:—

"Whenever Sontag obtained a brilliant triumph, Malibran would weep, and exclaim, 'Why does she sing so divinely?' The tears excited by these feelings of emulation were the harbingers of renewed exertion and increased improvement."

"Maria Malibran's nervous temperament and romantic turn of feeling inspired her with a passionate love of flowers. During her performance of *Desdemona*, on the evening of her benefit above alluded to, she betrayed her fondness for flowers in a singular way. When *Desdemona* lay dead on the stage, and the Moor, in his frenzied grief, was preparing to inflict upon himself the blow which was to lay him prostrate at her side, Madame Malibran, fearing the destruction of the bouquets and wreaths which lay scattered round her, exclaimed in a low tone of voice, 'Take care of my flowers! Do not crush my flowers!'"

"One day a friend was rallying her on the ardent passion with which she had inspired one of her admirers. 'Why, I confess,' she replied, with an air of simple earnestness, 'that I do believe he loves me, but what of that? I do not love him. I do not wish to set myself up as a heroine of virtue. I know the dangers to which I am exposed. I am young, untrammelled by pecuniary dependence, married to a man old enough to be my grand-

father; my husband two thousand leagues apart from me, and I exposed to every temptation—the probability is, that I shall fall in love some day or another. But rest assured that whenever I do, I will not play the coquette. When I meet with the man capable of winning my heart, I will honestly tell him that I love him, and my affection will never change. She kept her word.

“Her life was made up of a series of contrasts. On the one hand she beheld a throng of admirers, who, enchanted by her powerful talent, offered to her the incense of adoration. But that brow which could so nobly bear a crown, shrunk blushing beneath the cold, aristocratic salute. On returning home from a party, she has been known to burst into tears, exclaiming, ‘I am merely the opera singer—nothing more—the slave whom they pay to minister to their pleasure!’ From this it might naturally be presumed that Malibran would have felt gratified when a lady of high rank invited her to a party, and from motives of delicacy cautiously refrained from requesting her to sing. But no such thing! Such was her strange eccentricity of character, that though overwhelmed with attentions, she returned home ill-humoured and dissatisfied, and satirically expressed her acknowledgments for the generous and disinterested politeness of which she had been the object. It was easy to perceive that, of all mortifications, that which she most dreaded was to be deprived of her crown of professional glory.

“Madame Malibran, about this time, made the acquaintance, or, perhaps I should more properly say, gained the friendship, of M. Viardot in rather an extraordinary manner. As that friendship formed a feature in her after-life, I may relate the anecdote here. Madame Malibran was remarkably fond of riddles and charades, and delighted in puzzling people to guess them. One evening she was repeating a number of ingenious riddles at a soirée given by M. ——. All were laughing, guessing, and applauding her to the skies, when she perceived M. Viardot quietly seated in a corner of the room, apparently taking no interest in that which amused the rest of the company. This piqued her. It is true, M. Viardot was almost a stranger; but then, again, no pretty woman likes to be neglected, even by one out of a thousand. Maria again uttered another sally of wit, but in vain she looked for a smile from the sedate gentleman in the corner. Determined no longer to bear this, she rose after her next charade, and, approaching him, asked in a low voice, ‘Give me your opinion of my last.’ ‘It was not good,’ gravely replied M. Viardot, ‘because—’; and here he entered into his reasons for condemning it. She listened to him attentively, and when he had done speaking, she could not help remarking on the singularity of his disapproval, since every one else applauded her. ‘True,’ rejoined Viardot, ‘they seek to please you by flattery. But I really esteem you; therefore prefer telling you the truth, even at the risk of displeasing you.’ For an instant she looked attentively at him; then, holding out her hand, she grasped his, saying, ‘At length I have found sincerity. Grant me your friendship—mine is yours for life.’

“Madame Malibran was continually at variance with the directors of the Opera. They remonstrated with her on the little regard she paid to the preservation of her health, and the probable injury her voice would incur from her fondness for every species of amusement. Unlike other singers, she never spared herself.

On all occasions she was ready to volunteer her services. She amused herself with riding, dancing, and all sorts of violent exercises, and her fondness for late hours was highly prejudicial to her vocal powers. One evening she had promised me her company at an evening party. The managers unexpectedly determined that a benefit at which she was bound to perform should take place that night. Madame Malibran remonstrated, but in vain. Monsieur Robert was obdurate. ‘Well,’ said Maria, ‘make what arrangement you please: I will be at the theatre because it is my duty; but I’ll go to Madame Merlin’s because it is my pleasure!’ She kept her word. After playing Semiramide she came to my house, sang three songs, ate a hearty supper, and waltzed till long after the dawn of day. She did not, however, always escape the ill consequences of this imprudence, though the public were little aware of the state of suffering under which she appeared before them. On one occasion, having passed the whole night at a ball, on her return home, finding she had to play that evening, she retired to bed and slept till noon. On rising, she ordered her saddle-horse, galloped off, returned home at six, partook of a hurried dinner, and away to the Opera, where she was to play Arsace. Having dressed for the part, she was about to announce her readiness, when, overcome by exhaustion, she fell down in a fainting-fit. In an instant the alarm spread, and assistance was summoned. Twenty different remedies were tried, twenty bottles of perfume and other restoratives proffered, and among others a bottle of hartshorn. In the confusion of the moment, Monsieur Robert (who was terrified out of his senses by this unfortunate occurrence) unluckily seized the hartshorn, and applied it to the lips instead of the nose of the fainting prima donna. Madame Malibran recovered, but, alas! the hartshorn had frightfully blistered her lips. Here was an unforeseen misfortune; the house was already filled—the audience were beginning to manifest impatience. It was now too late to change the performance—Monsieur Robert knew not what apology to offer. ‘Stay,’ exclaimed Madame Malibran, ‘I’ll remedy this.’ Taking up a pair of scissors, she approached the looking-glass, and, though suffering the most acute pain, she cut from her lips the skin which had been raised by the blisters. In ten minutes afterwards she was on the stage singing with Semiramide-Sontag. It has often been said that she indulged in the use of strong spirits; that, in short, she was addicted to intemperate drinking. This was a mistake, arising from her occasional use of tonics. To these she had recourse when her failing strength required artificial stimulus. When nature refused to assist her, which was frequently the case, she would fly to these restoratives. She would sometimes take a glass of madeira to renovate her voice, and enable her to accomplish her fatiguing tasks. It was not any partiality for strong drinks. Could vinegar have produced the same effect, she would have flown to it. To accomplish her triumphs, she set physical force at defiance: nothing daunted her. In the instance above mentioned, her lacerated and bleeding lips caused her to suffer severe pain throughout the whole opera. To gratify her audience at Manchester, she sang three times the duet from ‘Andromica’ within a few hours of her death—a death caused by extreme and unceasing exertions.” *Quære?*

At Naples “the rule is, that when an actress is about to make her *début*, she waits on the

king, and solicits the honour of his majesty’s presence on her first appearance. In compliance with this regulation, Madame Malibran went to the palace, where she was received most graciously. On being introduced to the king, she said, hesitatingly, ‘Sire, if it be agreeable to your majesty, I have come to request that your majesty will be graciously pleased not to appear at the theatre to-morrow evening.’ The king, not a little astonished, demanded the reason of a request so singular. ‘May it please your majesty, I have heard that it is the etiquette in Naples not to applaud in presence of royalty: that is to say, unless you graciously set the example.’ The king, perceiving that she was embarrassed, desired her to speak out. ‘Sire, as you are good enough to command me to speak, I will. The fact is, I am so much in the habit of being applauded the instant I appear on the stage, that I am sure, if I were received in silence, I couldn’t sing a note.’ ‘Very well,’ said his majesty, ‘I will set the example. Fear not; you shall be abundantly applauded.’ Madame Malibran returned home highly satisfied by having thus secured powerful protection. In the evening, just before she made her appearance on the stage, she got between the side-scenes, where she might be seen from the royal box, and having caught the eye of the king, reminded him of his promise by clapping her hands. His majesty, pleased with her freedom and originality, failed not to be as good as his word, and the whole house loudly responded to the royal signal.

“Having played two or three nights beyond the number stipulated in her engagement, Madame Malibran demanded an increased salary, which the manager refusing, she signed an agreement with Azzolini, the director of the theatre at Bologna. On the whole, it may be said that Madame Malibran was not successful at Naples. This may be inferred from the following passage in a letter I received from her a few days before she quitted that city:—‘I have succeeded well here. I have every reason to believe the Neapolitans appreciate my talent, but they seldom applaud me. This will never do: applause to an actress is like warmth to life—it is a necessity. How can one sing without it? You will perhaps ask, were they deaf? No.—Did I sing badly? Far from it. It is merely because I am too thin.\* Do you understand me now? No. So much the worse, then, for I’ll give you no further explanation. \* \* I still regret my absence from Paris; but I will never return till I am married to De Beriot. Not that I fear the public, whom I have always found kind and indulgent, but on account of my friends and relations.’

“There resided in Naples at this time a poor French hairdresser, who vainly struggled to obtain a scanty livelihood. Madame Malibran sent for him, and desired him to attend daily to dress her hair, for which she paid him most extravagantly. As soon as he was gone, she would undo all his curling and plaiting, and again go through the operation of having her hair dressed by another *coiffeur*. Some friends remarked that she gave herself a great deal of useless trouble, and suggested that as she only employed the poor hairdresser for charity, it would be better to give him the money for doing nothing. ‘Oh no!’ replied she, ‘he is poor but proud; he thinks he earns the

\* \* \* The meaning of this is, that the king had ceased to applaud Madame Malibran, which she fancied arose from Madame de Begnis being under his protection. Madame de Begnis was at that time very stout.”

money, and consequently feels no humiliation in taking it. To receive reward is gratifying; to accept charity is degrading. Besides, when he hears my head-dress praised, he believes it to be his handy-work, and feels proud of his talents. To confer such happiness is worth any sacrifice."

"One day an intimate friend accused her of being generally too tame in the opening scenes of her characters; her reply was curious. 'I look upon the heads in the pit as one great mass of wax candles; if I were to light them up all at once, they would waste and soon burn out. But, by lighting gradually, I obtain in time a brilliant illumination. My system is to light up the public by degrees.'

In Venice she was constantly followed by a crowd. If she entered a shop, hundreds instantly surrounded it. If she took an airing in her gondola, (which, as I have before remarked, was easily distinguishable,) a little flotilla conveyed her as she glided along. The quays were lined by persons anxious to see her. Her landing was watched for, and her progress to her abode was a sort of triumphal procession.

"Her vivacity was almost superhuman. Frequently, on coming home from the theatre, she would begin dancing about, jumping over chairs, and playing all sorts of antics. When De Beriot endeavoured to dissuade her from these childish pranks, her answer was (like every thing else she did) strange and original: 'My dear Charles, you don't understand my nature. I cannot take premeditated repose; it can only come when I am compelled by exertion to have recourse to it. I cannot economise my strength—I use it just as it comes. When I try to restrain my flow of spirits, I feel as if I should be suffocated.'

"Malibran was very fond of riding, and was a graceful, though not a perfect, horsewoman. She had a natural talent for drawing. In public she was serious, distant, and respectful; in private, she was gay and childish. She was charitable, liberal, sincere, warm in her affections, of a most forgiving temper, of exquisite sensibility, unassuming to humility, mild and simple in worldly affairs as a child. She was ever desirous of casting the mantle of love over the failings of others. One evening she felt rather annoyed at the general prejudice expressed by the company then present against all English vocal compositions, the opinion being altogether in favour of foreign music; some even going so far as to assert that nothing could be good of which the air was entirely and originally of English extraction. Malibran in vain endeavoured to maintain that all countries possess, though perhaps in a less equal degree, many ancient melodies peculiarly their own; that nothing could exceed the beauty of the Scottish, Irish, Welsh, and even some of the old English airs. She then named many compositions of our best modern composers, Bishop, Barnett, Lee, Horn, &c., declaring her belief that if she were to produce one of Bishop or Horn's ballads as the works of a Signor Vescovo, or Cuerno, thus Italianising and Espagnolising their names, they would *faire furore*. In the midst of this discussion she volunteered a new Spanish song, composed, as she said, by a Don Chocarreria. She commenced—the greatest attention prevailed; she touched the notes lightly, introducing variations on repeating the symphony, and with a serious feeling, though a slight smile might be traced on her lips, began:—

'Maria tráya un caldero  
De aqua, Llama levante  
Maria pón tu caldero  
Ayamos nuestro té.'

She finished—the plaudits resounded, and the air was quoted as a further example how far superior foreign talent was to English. Malibran assented to the justness of their remarks, and agreed to yield still more to their argument if the same air, sung adagio, should be found equally beautiful when played presto. The parties were agreed; when, to the positive consternation of all present, and very much to the diversion of Malibran herself, the Spanish melody which she had so divinely sung, was, on being played quick, instantly recognised as a popular English nursery song, by no means of the highest class. Shall we shock our readers when we remind them that

'Maria tráya un caldero,'

means literally, 'Molly, put the kettle on.'"

With her death and funeral, or the correspondence, added, with much propriety, to illustrate the memoirs, we shall not meddle,—suffice it to say, that a life of excitement and intoxication was closed by a premature and distressing death.

*Law and Lawyers; or, Sketches and Illustrations of Legal History and Biography.* 2 vols. 12mo. London, 1840. Longman and Co.

THE bar offers as manifold and ample occasions for wit and humour, for colloquial pleasantry and matters of general interest, as almost all the rest of the social circle put together. If a man possesses talent, he has there the most obvious and frequent opportunities for displaying it; and the perpetual collision of intellect must create not only an aptitude and sharpness, but furnish a stock of various information, both curious and instructive. Any collection of the scattered fragments—the *disjecta membra*—of such matters must be amusing; and, accordingly, we find that our author, though abounding in many an old joke and ten-times-told tale, has produced an agreeable and entertaining work. His divisions, like his subjects, are desultory enough, and it has not always been easy to keep them distinct; for law education, the early struggles of eminent lawyers, legal eccentricities, sketches of chancellors and judges, lawyers in parliament, law literature, literary lawyers, the bench and the woolstack, and the morality of law and lawyers, &c., run into each other, and, indeed, seem in some cases to relate to the persons and things with only a change of names.

Upon the whole, looking at the biographies and anecdotes respecting the most eminent lawyers who have risen to the head of the profession, it seems pretty clear that the wildest and steadiest boys, the greatest rakes and most moral youths, drunkards, swearers, plodders, dissipated or sober, learned or ignorant, profane or religious, have all about an equal chance; and that the road to the highest preferment has been trodden with nearly the same success by the best and the worst of characters. In short, it is in evidence that a good lawyer, a great lawyer, a pious judge, a lord chief justice, or a lord high chancellor, may be made out of any sort of a man! This is a remarkable conclusion, but every page of our author bears it out. We will not, however, enter upon it by way of argument, but make as much as is necessary apparent from the selection of traits, of which we proceed to cull some specimens, choosing such as are least known or recollected.

"Lord Hardwicke, who, according to Dr.

King, did not learn Latin until after he was chancellor, was once haranguing the House of Lords with some warmth on the subject of a war with Spain. In the course of his speech he used the expression, '*pendente bello*.' '*Flagrante bello*, you mean, my lord,' interposed Lord Carteret, whose correct ear was offended with the unclassical expression. A learned counsel in the Exchequer, the other day, spoke of a *nolle prosequi*; 'Consider, sir,' said Mr. Baron Alderson, 'that this is the last day of term, and don't make things unnecessarily long.' Perhaps the learned gentleman held with Sir Matthew Raymond, 'that the courts were not bound by the Latin of the classics.'

"Lord Kenyon's style of oratory reminds us of a young Irishman's account of the first bar-speech he ever heard. 'Your lordships perceive that we stand here as our grandmother's administrators *de bonis non*; and really, my lords, it does strike me that it would be a monstrous thing to say that a party can now come in, in the very teeth of an act of parliament, and actually turn us round, under colour of hanging us up, on the foot of a contract made behind our backs.'

"A celebrated English lawyer, in quoting a statute, gravely observed that it was passed in the reign of one of the Edwards, or one of the Henrys, he did not know which. An anecdote has been told of a learned barrister once quoting some Latin verses to a brother 'wig,' who did not appear to understand them. Don't you know the lines,' said he; 'they are in Martial.' 'Marshall,' replied his friend, 'Marshall—oh! I know—the Marshall who wrote on *underwriting*.' When this anecdote was related to a certain judge of the Court of Review, he is reported to have said, 'Why, after all, there is not much difference between an *underwriter* and a *minor poet*.'

"When a very eminent special pleader was asked by a country gentleman if he considered that his son was likely to succeed as a special pleader, he replied, 'Pray, sir, can your son eat saw-dust without butter?'

Of Lord Northington "it has been asserted that he maintained his habit of using oaths to the last. When on the point of death he is said to have exclaimed, 'I'll be d—d if I'm not dying!' During his sickness, his wife, daughters, and some female friends, coming into his room to ask after his health, could not refrain from weeping. 'Surly Bob,' as he was called, on seeing this, roared out to his nurse, 'Turn out all those univelling fools, except Bridget!' The following anecdote is understood to refer to Lord Northington, at the time he was lord-keeper of the great seal. Stepping into his carriage one day, on his return home from the House of Lords, where one of his decrees had just been reversed, he ordered his coachman to drive fast over the stones, adding to the gentleman with him, 'The noise will drive all disagreeable ideas out of my head!' The plan succeeded very well, till an old woman crossing St. Martin's Lane, caused the coachman to 'pull up.' The lord-keeper finding the coach stop, desired the purse-bearer to inquire the reason from the coachman, who replied, 'I know my master would not have me kill the poor old woman. She is almost under the horses' feet.' The keeper, finding the woman was no longer in danger, exclaimed, 'Suppose we had killed her, her friends would have taken her to the House of Lords, and they would undo all we have done.'

"A clerk in chancery, of the days of Cromwell, who had seen with the utmost indifference

all the changes in church and state which had occurred in his time, when he was told that some new regulations were to be introduced into the Six Clerks' Office, exclaimed, 'Ah! if they come to strike at *fundamentals*, where will they stop?' The great Lord Clarendon, in his 'Autobiography,' mentions a circumstance which illustrates this point in the legal character. The great fire of London happened at a time of year when most of the lawyers were out of town. When the conflagration reached Serjeant's Inn (Fleet Street) and the Temple, much property was destroyed because the owners were absent, and their chambers were locked. 'Many gentlemen of the Inner Temple,' says Clarendon, 'would not endeavour to preserve the goods that were in the lodgings of absent persons, because they said it was against the law to break into any man's chamber.' This is more absurd than the old story of an Oxford man saving, at the risk of his life, a fellow collegian from drowning, and then apologising for the liberty he had taken, as he had not had the pleasure of having been introduced to him! Roger North gives also an absurd instance of the lawyers' attachment to mere form. In his days the court of Common Pleas used to sit in Westminster Hall, close to the great door, in order that suitors and their train might readily pass in and out. When the wind was in the north, this situation was found very cold, and it was proposed to move the court further back, to a warmer place. 'But the Lord Chief Justice Bridgman,' says North, 'would not agree to it, as against Magna Charta, which says that the Common Pleas shall be held in *certo loco*, or in a certain place, with which the distance of an inch from that place is inconsistent, and all the pleas would be *coram non iudice*.' That formal reason hindered a useful reform, which makes me think of Erasmus, who, having read somewhat of English law, said that the lawyers were '*dehissimum genus indoctissimorum hominum*.' One of the most extraordinary reasons which any lawyer has alleged against effecting law reforms, is that assigned by the Chancellor d'Aguesseau. He was once asked by the Duke de Grammont whether he had ever thought of any regulation by which the length of suits and the chicanery practised in the courts could be terminated. 'I had gone so far,' said the chancellor, 'as to commit a plan for such a regulation to writing; but, after I had made some progress, I reflected on the great number of *avocats*, attorneys, and officers of justice, whom it would ruin: compassion for these made the pen fall from my hands.'

'Dr. Brodum, a notorious quack, was once under examination by Mr. Abraham Moore. 'Your name is Brodum, I believe?' inquired the counsel. The doctor nodded assent. 'Pray how do you spell it—Brodum or Broad-hum?' On this there was a loud laugh in court, which was not diminished when the quack replied, with admirable self-possession, 'Why, sare, as I be but a doctor, I spell my name Bro-dum; but if I were a *barrister*, I should spell it Broad-hum!'

'A little fellow, who had scarcely any business, was one day endeavouring to get the judge to attend to a motion he wanted to make—but it was no use; he never could catch the judge's eye. Jekyll, looking at the bench, said, in an inimitable tone, '*De minimis non curat lex*.' A Welsh judge, famous both for his neglect of personal cleanliness and his insatiable desire for place, was once addressed by Mr. Jekyll: 'My dear sir, as you have asked the minister for every thing else, why have

you never asked him for a piece of soap and a nail-brush?'

'An attorney, named Else, rather diminutive in his stature, and not particularly respectable in his character, once met Mr. Jekyll: 'Sir,' said he, 'I hear you have called me a pettyfoggish scoundrel. Have you done so, sir?' 'Sir,' replied Jekyll, with a look of contempt, 'I never said you were a pettyfoggish or a scoundrel, but I said that you were *little else*!'

'The practice of the law is not altogether—certainly, unless corrected by other studies—favourable to the promotion of those comprehensive and liberal views which should characterise the statesman. 'Whilst it sharpens the edge it narrows the blade,' as Coleridge has well observed. Lawyers are apt to regard too much the formal, and too little the real nature of things, and to mistake words for things. Sir James Marriot, an admiralty judge, in addressing the House of Commons on the question of American taxation, declared, 'that it appeared to him that the matter had been mistaken throughout the whole argument. It had been contended that America should not be taxed, because she was not represented. But the assertion is untrue, seeing that, when we took possession of America, we did so as part and parcel of the manor of East Greenwich, in the county of Kent.'

'Mr. Hargrave is reported to have said, that 'any lawyer who writes so clearly as to be intelligible, was an enemy to his profession.'

These examples of its *faciès* will illustrate the nature of the publication; and we have only shortly to refer to two or three other extracts for all that we deem it requisite to say upon it. The following seems to be an uncalled-for and unjustifiable attack upon a very liberal profession:—

'Another charge that it has delighted malice to bring against the bar is, avarice—a spirit of cupidity—a thirsty love of gain. How far this charge can be justified, may be seen by comparing their conduct and that of the medical profession, in reference to the new Poor-Law. Although this measure has reduced, to a very considerable amount, the fees of counsel at the sessions (the losses of some of the session leaders has been estimated at several hundreds a-year), yet, taking them as a body, they have supported it; whilst the apothecaries and surgeons, whose profits have also been curtailed, and who have no longer been permitted to neglect the poor at the rate of so much a-head, have been busy and prominent in getting up petitions—assembling public meetings—putting in motion all the petty machinery of agitation to frighten the legislature into a repeal of the obnoxious act. Indeed, the joke of the avarice and cupidity of the lawyer is now seldom heard, except on the stage, where every 'parson' is a fool, every 'mayor' a glutton, and every 'doctor' a quack and a cheat. Some of the scandal in which our profession has been involved, has originated in the shabby tricks of a few, and more in the *badinage* of the man. Serjeant Davy was once accused of having disgraced the bar by taking silver from a client. 'I took silver,' he replied, 'because I could not get gold; but I took every farthing the fellow had in the world; and I hope you don't call that disgracing the profession?'

The last confession may be taken as an apology for the preceding assaults on physic, and a perfect type of law in all its branches. Another case of attack is thus related:—

'An action was brought by a builder at Battle, to recover the amount of his bill for building a house. A surveyor was examined to prove that the work had been properly executed, and, according to the custom of his fraternity, he delivered his evidence in a tone of pompous conceit. Cockle, in examining him, treated him with an air of mock-respect, which made him believe that the serjeant admitted his pretensions, and estimated him at the value he set upon himself. Cockle begged him to produce the original of the estimate he had made of the work charged. It was accordingly handed to him. It stated the names of the plaintiff and defendant, the various items of the charge, and concluded, 'I value at the sum of 350*l.* the above work done at Battle, in the county of Sussex.' When the serjeant addressed the jury, he did so in the following words: 'Gentlemen, a surveyor is an anomalous kind of animal; he can neither think, nor speak, nor write, like a common person. His perfect conviction of his own importance is shewn in every word he utters, and in every sentence he writes, even to the making out of a carpenter's bill. This puppet surveyor is not content with giving his estimate in plain language, and signed with his name; he must assume the style of an ambassador, and sub-scribe as an envoy would a treaty of peace. Look at the estimate and bill; he sets out the particulars of the charge, which he pronounces to be of the value of 350*l.* per carpenter's work—that is plain English; but how does it conclude? In the dignified language of diplomacy; 'Done at Battle, in the county of Sussex!' signed as our ambassador at Paris would conclude a treaty of peace for Great Britain.' It was by his powers of humour that Cockle succeeded in winning verdicts.'

The following notice of distinguished lawyers who have risen from the rank of reporters on the public press, will be read with interest.

'There are a class of men at the bar to whom we must now be permitted to advert. We allude to those whom that dire necessity, which knows no law, has compelled to make literature their support in their way to the bar. It is well known that a considerable number of the reporters for the public press are bar students; and that many of the most eminent men by whom our profession has been adorned, owed their subsistence, during their studentship, to the same resource. The present Mr. Serjeant Spankie was a reporter on the 'Morning Chronicle;' so, also, was Sir John Campbell. The late Master Stephen was also employed in a similar capacity. Lord Plunket was a reporter for, and afterwards editor of, the 'Dublin Patriot.' The proceedings at the bar of the House of Lords, during the progress of the Queen's trial, were reported for the 'Times' by an eminent special pleader of our day. Some years ago, the benchers of Lincoln's Inn passed a resolution, on the motion of Mr. Clifford, of O. P. notoriety, the effect of which would have been the exclusion from the society of all persons connected with the public press. A petition was presented to the House of Commons, by a gentleman against whom the illiberal resolution operated, and so severely was the conduct of the benchers condemned in the course of the debate that ensued, that they were induced to retract their steps. During the debate, Mr. Sheridan stated, that amongst those who reported the proceedings of the house, there were no less than twenty-three graduates of the Universities

of Oxford, Cambridge, Dublin, and Edinburgh. He alluded to the cases of Mr. Burke and Dr. Johnson, as shewing how idle it was to connect the notion of a reporter with any thing like a disqualification for the highest offices of the state. Mr. Stephens followed in a speech in every way creditable to him. He declared that he had been a member of Lincoln's Inn for five-and-thirty years, and not only had had no share in framing the by-law in question, but considered it as replete with injustice—a scandal rather to its authors than its objects. 'I will suppose,' he said, 'the case of a young man of education and talent, contending with pecuniary difficulties—difficulties not proceeding from vice, but from family misfortunes. I will suppose him honestly meeting his obstructions with honourable industry, and exercising his talents by reporting the debates of this house, in order to attain to a profession. Where, I ask, is the degradation of such an employment? Who would be so meanly cruel as to deprive him of it? The case, sir, which I have now supposed, was, thirty years ago, my own!' We have been informed, however, that the resolution was rather declaratory than creative, for a custom had formerly existed of considering reporters, and persons connected with the press, as ineligible for the bar. And in the case of a learned serjeant, who has since required a great reputation as an advocate and as a lawyer, some apprehensions were expressed whether

his society would consent to call him, as he was at that time 'in the gallery.'"

With this we finish. *Law and Lawyers*, besides its entertaining qualities, contains a great deal of information on topics of general interest.

#### THE TOWER OF LONDON, NO. III.

MR. AINSWORTH proceeds gallantly with the first of his stories of the Tower of London, Queen Jane Grey; and Cruikshank, with equal invention and skill, in his illustrations. We regret that the three plates in each number are engraved on a material which does not permit of our copying them into a typographical sheet; if we could, the scene of "The Queen and Lord Guilford Dudley brought back to the Tower," in the last number, would have claimed our choice: but as we cannot exemplify this striking representation, we shall select a view of the White Tower, which is a beautiful specimen of the art of wood-engraving, where delicacy and artist-like effect are displayed to the greatest advantage. The letter-press description of this tower does honour to the author's antiquarian zeal and research, and sheds a reality over the events embraced by his narrative. Since he has been so pelted for making all the world Jack Sheppards by the force and spirit of his preceding publication, we think it will be but doing him justice to acknowledge a similar talent in this historical and most unobjectionable composition.

#### MISCELLANEOUS.

*The United States of North America as they are; not as they are generally described: being a Cure for Radicalism.* By Thomas Brothers, Resident in the United States Fifteen Years. 8vo. pp. 517. London, 1840. Longman and Co.

Of all the pictures that have been drawn of the United States, this, by a plain-dealing manufacturer settled in the country during fifteen years, is by far the most unfavourable. Enimoured of Tom Paine, Mr. Brothers

sought a congenial soil and people across the Atlantic, and how complete and bitter his disappointment may be gathered from every page of this work. He asserts it to be a well-known fact, that the New York fires were per-

... Mr. Justice Lawrence, who was in general remarkable for his courtesy, always displayed towards such barristers as were, or had been, connected with newspapers, a roughness altogether opposed to his habitual urbanity. His dislike, however, was in some degree justified by the fact, that many of these individuals employed the meanest artifices to obtain practice, and endeavoured to acquire reputation by constantly inserting their names in the paper."

petrated by incendiaries; but, indeed, there is no point of view in which he does not consider America to be in a wretched condition, the general state of the Union forced and odious, the discipline of the prisons cruel beyond credibility, the system of banking the basest swindling, the vote by ballot a humbugging trick and oppression, the conduct towards the Indians bloody and abominable; and, in short, the whole a frightful state of society. These opinions he supports by the statement of circumstances and official documents; of the authenticity and application of which we leave readers to judge.

*Annual Supplement to the Tithe Commutation Tables, for Ascertaining at Sight the Tithe Rent-charge payable for the year 1840, according to the Average Prices of Wheat, Barley, and Oats, &c. &c.* By C. M. Willich. London, 1840. Longman and Co.

WE have again to notice this very useful Annual, for which every tithe-payer and tithe-receiver is much indebted to the able Secretary of the University Life Assurance Society.—It is as clear and simple as possible.

#### ARTS AND SCIENCES.

##### ROYAL GEOGRAPHICAL SOCIETY.

FEBRUARY 24.—Mr. Greenough, F.R.S. President, in the chair.—Extracts from the following papers were read:—1. From Mr. James Brooke, of the Royalist yacht, dated Singapore, 19th October; communicated by J. C. Temple, Esq. In this letter Mr. Brooke states that he has passed three months in the Island of Borneo, that he has lately lived for ten days in the interior amongst the Dayak tribe, called the Sibuyaws, and had seen and visited other Dayaks, so as to become acquainted with their habits, manners, customs, and, in some degree, with their language. The result of Mr. Brooke's experience is, that the Dayaks are not all the same people, the difference being marked and striking. In natural history two distinct species of orang-outang had been discovered, the larger being from six to seven feet in height.—2. A letter from Mr. Ainsworth at Aleppo, on the 20th December, stating that he and Mr. Rassam had reached that place in thirty-two days from Constantinople: their road had led them by Iank, to the deposits of Moerschaum at Eski-Shehr, and to Koniayah. They entered the Egyptian territory at Kulek Boghaz, and kept the direct route to Aleppo. The army of Marash was said to be disbanded, affairs wore a very peaceful aspect, and there seemed every prospect of their effecting their journey to Mésul without any difficulty.—3. 'Notes on a Journey from Tabriz, through Persian Kurdistan, to the Ruins of Takhti-Soleimán, and from thence to Gilán, in 1838; with a Memoir on the Site of the Atropatenian Ecbatana.' By Major H. C. Rawlinson; communicated by Viscount Palmerston. From Tabriz, in a S.S.W. direction about fifty miles, is Shishewán. This village belongs to Melik Kásim Mirzá, a son of the late Sháh of Persia; and is, perhaps, one of the most interesting places to be found in Azerbáiján. The prince, who has built himself a palace in the European style near the village, and who usually resides here, is quite a character. To great intelligence and enterprise he unites a singular taste for the habits of European life, and the cultivation of many useful arts which belong to European civilisation; so that Shishewán is rapidly assuming the appearance of an European settlement. His hobby, at the time of Major R.'s visit, was shipbuilding on the lake

of Urumiyah, only a mile distant from his palace. Elated with his first essays, he now aims at higher things, and will not rest satisfied till he can run up and down the lake in a steam-boat. "Travelling forty miles further," says the writer, "in a S.S.W. direction, brought me to the village of Chillik, whence I set out in search of a most interesting object of antiquity, which I had heard of in the neighbourhood. This was the cuneiform inscription of Tâsh Teppeh, an isolated hillock in the plain, distant five miles from Chillik, in a south-east direction. On reaching the spot I found the teppeh to be of an irregular shape, 350 paces in circumference at the base, and, as well as I could judge, from fifty to sixty feet above the level of the plain; it is formed of a projection of limestone above the soil, lying in strata nearly perpendicular; the whole face of the hillock, fronting Chillik, thus presents a series of smooth surfaces, adapted to the engraving of sculptures or inscriptions; and upon one of these natural tablets I found the object of my search. The inscription is about thirty-five inches square, and consists of twenty-one lines, written in the Median alphabet, somewhat modified from the form which it exhibits on the tablets of Bâistân, Hamadân, and Persepolis; it is deplorably mutilated, the rock being liable, from the direction of the strata, to chip off in large flakes, so that the greater part of the writing is thus altogether destroyed. I conclude that the hillock was anciently surmounted by a fire-temple, and that the purport of the inscription is religious; but it is, I fear, in too imperfect a state to admit of any correct version. Rounding the southern end of the lake of Urumiyah, forty miles in a westerly direction, brought me to Ushneî. This district has been little visited by Europeans. Situated at the foot of the great Kurdistân mountains, and surrounded on other sides by an amphitheatre of lower hills, it occupies a natural basin of small extent, but of great beauty and fertility. The river Gâder, debouching from the mountains by a deep and precipitous gorge, bisects the plain; and numerous other streams, which descend from the same hills, supply the means of irrigation most abundantly throughout the district. The plain is irregularly shaped; its extreme length and breadth being about ten miles, and the little town of Ushneî is upon the rise of the mountains, near its north-western extremity: there are about forty other villages dispersed over the adjacent country. The inhabitants are Kurds, of the tribe of Zersâ, now reduced to about 800 houses; but numbering, before the plague which some years ago attacked this part of Azerbâijân with unusual severity, between 4000 and 5000 families. The town of Ushneî alone, ten years ago, was estimated to contain 1000 houses; at present there are not above 200. From Ushneî I rode fifteen miles south-west to visit the famous blue pillar of Keli Shîn, which bears a long cuneiform inscription; I thence retraced my steps to the eastward, and, by a circuitous road, passing by the town of So-uj Bolak, the pillar named Keli Sipan, Miyandab, the remarkable caves of Karaftu, about 300 miles, brought me to the ruins of Takhti-Soleimân, on the summit of an isolated hill. From a distance they present to view a grey, hoary mass of crumbling walls and buildings, encircling a small piece of water of the deepest azure, and bounded by a strong line of wall supported by numerous bastions. A nearer inspection shews the ruins, perhaps, to less advantage; but I confess, to me it was fraught with much interest, for at every step I met with fresh

evidence to confirm me in the belief that I now beheld the great capital of Media. I was occupied for the greater part of three days in examining the ruins, and taking a regular survey. The hill of Takhti-Soleimân appears, at first, as if it were isolated, but this is not strictly the case. The brow of the hill is crowned by a wall, the most perfect part of which is along the southern face, and the most ruinous upon the western. There are the remains of thirty-seven bastions, and the circuit of the wall, measured from point to point of these bastions, is 1330 paces, or a little more than three-quarters of a mile. At a few points only near the gateway, on the south-eastern face, is the line of wall perfect; but where it is perfect the masonry is shewn to be most excellent. Above the gateway, and extending from one bastion to the other, are a line of blocks, each carved with a rude representation of an arch, which thus form a sort of ornamental frieze to the portal, and offer the only specimen of ancient sculpture to be found upon the walls. Passing through the gateway, I found myself within the precincts of the deserted city; the first object that attracted my attention was the lake. I found this to be an expanse of water on the highest point of the hill, irregularly shaped, and about 300 paces in circuit; the rocky banks that surround it are formed of a deposit of carbonate of lime, of which the water holds vast quantities in solution, and there can be no doubt but that they are daily narrowing as the calcareous deposit continues; a very short distance from the surface they recede inwards, thus forming a huge incurved basin for the lake. Sir R. K. Porter states his belief, that the hill has been formed entirely by deposition from the water, and this, in very remote antiquity, would seem to have been the case, for the depth of the water, recently determined by repeated experiments of the Afshâr chief at forty-seven Persian yards, agrees, as near as possible, with the height of the hill, ascertained by myself. Having completed my examination of these remarkable ruins, I continued my journey to the eastward for about 120 miles, by the little travelled road of Zanjan and Tarom to Resht. In my attempt to identify the position, and to illustrate the history, of the ancient capital of Media Atropatene, I propose, in the first place, to establish the verification of the ruins of Takhti-Soleimân in Oriental geography; to proceed from that point to the connexion of the early Arabs with the Byzantines; to trace up afterwards the fortunes of the city through the flourishing ages of the Roman and Greek empires; and thus finally to arrive at the dark period of the Median dynasty, where fable is intermixed with history, and glimmerings of truth can only be elicited by careful and minute analysis." Such is the line of argument proposed by Major Rawlinson; the result he arrives at, at the conclusion of a long memoir evincing very great industry and research, may be stated in his own words:—"I have shewn that Herodotus describes the capital of Media Atropatene under the name of Ecbatana, with certain traits of descriptive character only applicable to the ruins of Takhti-Soleimân; that the same place is so called in the book of Tobit Charran; which title I have succeeded again in tracing down through various fields of evidence to the time of the Arabs, by whom the city occupying the site of Takhti-Soleimân, was still named Arran, identical with Charran, in its latest stages of existence; that the ancient Persian name of Var, also attached to the castle of this city of Dejoces, was pre-

served in the Greek Vera, the distinctive epithet of the fortress besieged by Mark Antony at Takhti-Soleimân; that Gaza, the more familiar appellation of the Atropatenian capital, is but the translation of its ancient name Ecbatana; that Alexander and his officers, in failing to penetrate to this city, failed also to discover its distinction from the Ecbatana of Greater Media; and, that the confusion of all subsequent geography is to be referred to this source; that later authors preserve notices of Ecbatana, which can only be explained by their application to the Atropatenian capital of that name; the authors themselves, at the same time, appearing in their ignorance to refer them to the other city; that this connected series of ambiguous allusions to the Ecbatana of Northern Media continues from the point where we lose sight of the city, under a distinct and positive form of evidence, up to the period when the capital having changed its name becomes familiar to the Romans, under the title of Gaza; and here I close the most ancient, and, consequently, the most difficult part of the inquiry. The next stage of the inquiry takes up the argument at the period of Antony's Median war; it connects all the notices which occur in classic authors of the Atropatenian capital, between this era and the extinction of the Parthian monarchy; it assumes, as a natural inference, strengthened by an accumulation of inductive evidence, all tending to the same point, that this capital must necessarily occupy the same position as the one which has been hitherto traced under the name of Ecbatana; and, in shewing the application to the site of Takhti-Soleimân, of all the recorded measurements and all the illustrative evidence of the period, it, at the same time, verifies the preceding argument, and passes on the great question of the identification of the Ecbatana of Dejoces to the more tangible epoch of the Sassanian dynasty. In the third stage of the inquiry the great object is to establish a connexion between the Byzantine account of the Atropatenian capital, and the Oriental notices of the same city; and this is effected by shewing the events assigned by one party to Canzaca, to be described in the annals of the other, as occurring at the great city of Shîz; and, by detailing the evidence common to both parties, of the famous temple that contained the most sacred fire of the Persians being situated in this city of Canzaca or Shîz, which was the capital of the province of Azerbâijân. There are, besides, several measurements and other traits of evidence in this period of history, which uniformly accord in their applicability to the site of Takhti-Soleimân, and thus tend most forcibly to strengthen and consolidate all the preceding parts of the argument. The inquiry is then brought to a close by the verification of the position of the Arabian Shîz in modern geography. The detailed account of this place which I have extracted from the work of Zakariyâ Kasvini, compared with my own personal observation of the ruins of Takhti-Soleimân, cannot leave the shadow of a doubt as to the identity of the two places; and I believe that, in the connexion and result of these four points of analysis, a difficulty is thus solved, which for want of a little attention and a correct topographical knowledge, has continued to the present day the great problem of Asiatic comparative geography; and which, in the obscurity which it has hitherto cast over the map of ancient Persia, has presented one of the chief impediments to the spread of this interesting and instructive science."

Major Rawlinson's paper was illustrated by maps, &c., a ground-plan of the ruins of Takhti-Soleiman, and a copy of the inscription on the cases of Karafu. Among the donations was a beautifully drawn and engraved map of Wales and the bordering districts, forming a portion of the new edition of Mr. Greenough's geological map of England, and which illustrates admirably the physical configuration of that part of the island.

#### LINNEAN SOCIETY.

MR. BROWN, Vice-President, in the chair.—Read, a note upon the fern known as the *Aspidium Barometis*, by Mr. John Smith, A.L.S. The author refers the plant to the genus *Cibotium*, and he adds an enumeration of the species belonging to the genus.—Read, also, a paper on a group of plants nearly related to *Burmanniacea*, by John Miens, Esq. F.L.S. This interesting group of plants forms an evident transition to the *Orchideae*, with which they agree in the structure of their fruit and seed. They are principally natives of Brazil.

#### PARIS LETTER.

Academy of Sciences, March 3, 1840.

SITTING of February 24.—M. Flourens communicated some further results of his experiments on the tinging of the bones of animals by infusing madder into their alimentary substances. By carefully observing the alternation of coloured and colourless strata in the bones, caused by the giving and the withholding of madder during successive periods, he had been led to the discovery that bones increase by the deposition of bony matter on the outside, and that they diminish by the dissolution of bony matter in the medullary cavity. He exhibited the skeletons of some sucking pigs, as instances of the rapid action of madder in tinging bones: a fine rose-colour having been imparted to the bones within twenty-four hours after it had entered the stomach.

Baron C. Dupin, in the name of MM. Gay Lussac and Arago, as well as himself, read their report on a new ballistic pendulum, and cannon pendulum, for testing the force of powder, and the advantages of various kinds of artillery, invented by MM. Piobert and Morin. The report adverted to the originating of experiments of this kind at Woolwich, and mentioned the previous labours of these gentlemen in the science of projectiles. A new kind of butt was used for the more accurate determination of the force of projectiles, consisting of a sort of inverted iron cone properly stuffed with sand, fascines, and other materials, which admitted of the exact degree of penetrating power being ascertained. M. Piobert had also, as the report went on to state, made an important discovery of a method of preventing explosions of gunpowder. It was by mixing the powder, or dust of gunpowder, always made during the fabrication, with the grained powder: and it was found that such a composition, though highly combustible, had not the same explosive force as the grained powder alone; but when ignited, burnt like a fuse instead of exploding. Powdered saltpetre mixed with the grained powder was found to produce the same effect. When the powder was required for use, it could be immediately made serviceable by passing it through proper sieves. It was stated in the report, that in case of a war breaking out in Europe a supply of fifty millions of kilogrammes of powder would be required for the army, the navy, and the various garrisons; but that as the country only manufactured two millions annually, and even in Napoleon's time

never could supply more than that quantity, it became necessary to accumulate vast stores of powder, and, therefore, this invention of M. Piobert's might become of immense importance to the safety of all who were forced to live near powder magazines.

M. Champaux la Boulaye, commander of the *Styx*, government steamer, described some improvements which he had made in naval steam-engines, by a simple modification of the apertures through which the steam issued from the boilers. He had been able to increase the power of his engine from thirty to forty per cent in this manner. Notice was taken in the same communication of Lieut. Janvier's new method of fixing the paddle-wheels to the maintree of the engine, which was accomplished by the pressure of a lever upon a metallic disk. A few strokes of a hammer would either diminish or increase this pressure at pleasure; and the wheels could thus be made either to remain totally free from the action of the tree or axle, or else to revolve with it from a previous state of rest as rapidly as the word of command could be given,—the engine continuing to work all the time. This invention, which has excited the greatest sensation at Toulon, is likely to come into general adoption in the French navy: it is applicable to old machines.

M. Pambour addressed a memoir to the Academy, on the practicability of giving inclined planes in railroads a much greater inclination than they were now allowed to have, without any increase of danger to the vehicles.—Mention was made of some modification of Laplace's formula for ascertaining the elevations of mountains by the barometer, employed by M. Ritter, of Geneva, and by which a difference of one five-hundredth part of the total elevation might sometimes be detected.—The astronomical observations made at the Paris Observatory upon the comet discovered on 25th January, 1840, at Berlin, by M. Galle, were stated. It appeared that the elements of the orbit of this comet were very similar to that of the comet of 1784, which was observed by Mechain; and, in fact, if it were supposed that this astronomer had made a mistake in noting the descending nodus of his comet for the ascending one, it might be said that their elements were identical, and that they were one and the same body.

M. Verignon presented some photogenic drawings, obtained on paper prepared first with an aqueous solution of hydrochloric acid, and afterwards, having first been dried, passed through the following mixture:—

Water .....	70
Chlorhydrate of ammonium ....	2
Bromure of sodium .....	2
Chlorure of strontium .....	1

The paper is then again dried and passed through a very weak solution of nitrate of silver. A double decomposition is thus effected, and a chlorure as well as a bromure of silver is made, which is allowed to become black by exposing the paper to the light for about half an hour. The paper thus prepared retains its sensitive powers for about a fortnight; but after that time loses its efficacy, and the black tint penetrates through to the other side of the paper. To obtain the photogenic effect, the paper has only to be dipped in a very weak solution of iodure of sodium, and then to be placed, while wet, in the camera obscura. At the expiration of ten minutes, if the weather be favourable, the photogenic effect is completely attained; and the drawing is fixed by afterwards passing the paper through a weak

solution of hyposulphite of sodium and iron, and then washing it in pure water.—M. Bayard's process was communicated to the Academy in a few words. This gentleman employs common letter-paper, prepared according to Mr. Talbot's method, blackened by the influence of light; it is then steeped for a few seconds in a solution of iodure of potassium, and, having been placed on a slate, is put into the camera obscura. When the photogenic effect is produced the paper is washed, first in a solution of hyposulphite of sodium, and then in pure water warmed. It is afterwards allowed to dry in the dark.—Dr. Donné presented some further specimens of his photogenic images obtained with the microscope.

M. Marcel de Serres contributed a paper from Professor Joly, of Montpellier, on the presence of infusoria in salt marshes giving the water a red colour: he had named this insect *monas dunali*; it had always been supposed that the insect was the *artemia salina*. Professor Joly threw out a hint that the red colour of certain strata of rock-salt might have been caused by the presence of infusoria of this kind; and he had dissolved some, which, on afterwards examining it with a microscope, he found left small red particles similar to those of the salt marshes.

*Académie Française.*—We were so much taken up last week with the rejection of Victor Hugo, that we quite forgot to mention the election of a literary nonentity to the vacant chair of the late Archbishop of Paris. Count Molé was the only candidate, and he obtained thirty-one votes out of the thirty-two given by the members present, the remaining one being given to Victor Hugo.

The Paris savans, who take an interest in Egyptian antiquities, are much occupied with the work of M. Goulianol, a Russian orientalist, who has devoted much time to the study of Egyptian archaeology, and has recently given to the public three volumes on the subject, written in French, and published simultaneously at St. Petersburg and Paris. M. Goulianol is looked on as in some respects an antagonist of the late M. Champollion: he attributes a Phœnic-Samaritan origin to the Egyptian characters, which, though at the beginning strictly phonetic, became at last mixed up with the ideographic. M. D'Albret, principal gardener at the Luxembourg, has published his course of lectures on the pruning and general treatment of fruit-trees. His lectures, given in the morning during the summer to a comparatively numerous auditory on the spot, have obtained good repute among practical men.\* M. Eléazar Blaze, the French Nimrod, has been putting out another book on the chase, which he calls the "Chasseur Conteur;" or, in other words, "Sporting Anecdotes." He has also established his claim to be considered an antiquarian, having edited the "Livre du Roy Modus," the most ancient work on hunting existing in the French language; it is beautifully got up, printed in black letter, and carefully collated from the MSS. in the Bibliothèque du Roy.

The following observation of Galle's comet was made at Geneva on the 23d ult.:—Sidereal time, 6h 11m 32s.10; right ascension, 0h 53m 22s; north declination, 40° 15' 52". The right ascension of this comet increases daily by 4m 8s, and its north declination diminishes by 58" daily. It has no tail and scarcely any per-

\* The Literary Society of Richmond have petitioned government that something of the same kind might be most advantageously done at Kew Gardens, instead of neglecting them.—Ed. L. G.

ceptible nucleus. It is invisible to the naked eye. Another observation of the 21st February, at Padua, gave the following:—Mean time of Padua, 9<sup>h</sup> 45<sup>m</sup> 54<sup>s</sup>; right ascension, 0<sup>h</sup> 44<sup>m</sup> 6<sup>s</sup>; north declination, 41° 58'; by Professor Santini, director of the Observatory of Padua.

The annual exhibition of modern paintings, &c. at the Louvre, is postponed till the 5th of this month (Thursday). It is said that upwards of 3000 articles have been refused admission.—We learn from Lyons that the number of persons attending the various courses of lectures in the Faculty of Arts of that city, is as follows:—Philosophy, 200; history, 1850; ancient literature, 50; French literature, 80; foreign literature, 800.

Professor Viviani, of Genoa, the eminent naturalist and mineralogist, died there on the 15th ult.

#### LITERARY AND LEARNED. UNIVERSITY INTELLIGENCE.

OXFORD, Feb. 27.—The following degrees were conferred:—

*Masters of Arts*.—Rev. D. Williams, Jesus College.  
*Bachelors of Arts*.—U. Corbett, Student of Christ Church; D. Edwards, Jesus College.

CAMBRIDGE, Feb. 26.—The degree of Doctor in Divinity was conferred by Royal Mandate on the Right Rev. H. Pepps, of St. John's College, the new Bishop of Sodor and Man.

The following degrees were also conferred:—*Masters of Arts*.—J. Brown, Trinity College; B. E. Lampet, Corpus Christi College.

*Bachelors of Arts*.—C. T. Davies, Queens' College; K. McKenzie Pugh, St. John's College.

The Rev. Ed. Hill, of Christ Church, Oxford, was admitted *ad eundem* of this university.

#### ROYAL SOCIETY.

THE Marquess of Northampton's first evening assemblage, as President, took place as announced on Saturday, and was attended by a multitude of distinguished men—men distinguished in station, in science, in literature, and in the arts. It is difficult to speak of such meetings without an appearance of flattery; but we must, as recorders of matters of public interest, say that the noble Marquess seems to us to take exactly that course which is best calculated to advance the great objects held in view on such occasions. The circles invited around him are select yet popular: the highest intellectual powers may there interchange ideas and opinions, whilst the eminent in the polite, and the skilful in the useful pursuits of life, the benefactors of society in all its various ramifications, including those of humble as well as those of high rank, are welcome and honoured guests. Among the throng we recognised heads of the government, and leaders of the opposition—members for and members against privilege—historians, poets, essayists, sculptors, painters, engravers, philosophers, scientific men, and mechanics with curious inventions and improvements. Here, through beautiful instruments you could trace the circulation of sap in the minutest leaf; there, some other remarkable microscopic phenomena of nature, and elsewhere the manufacture of threads of glass into the richest fabrics for gorgeous furniture. On one hand the same material, *glass*, enabled you to trace the secrets of vegetation and of life, and on the next table you saw it employed as an article of domestic luxury and show! And these are but instances of the general instructive combination and beneficial effect of such Evenings when judiciously directed. The foreigner, too, who comes amongst us to make himself acquainted with our national standing in all those particulars which adorn civilisation or promote the well-being of the human kind, is enabled at a

single opportunity, like this, to make greater progress in his inquiries, and lay better grounds for his future information, than he could do by many days of fatigue and anxiety. This alone is a great desideratum; but, indeed, the whole arrangement is one so full of pleasure and utility, that we cannot but consider the thanks of the community pre-eminently due to the noble President for the manner in which he gives these entertainments. Let us in justice add, that his own suavity of manner and intelligence do not contribute a little to their genuine enjoyment.

Mar. 5. The Marquess of Northampton in the chair.—The answer of Prince Albert to the congratulatory address of the Society having been entered on the minutes, was read. It stated that, amongst the many addresses of congratulation which he had received, none had given him more satisfaction than that from the Council of the Royal Society.—The conclusion of Sir John Herschel's paper referring to experiments in the photogenic art was read.—Read, likewise, a paper supplementary to other papers on the Theory of Light, by the Rev. Baden Powell. This communication is wholly analytical.—A letter from Mr. Maclear was also read. It gave further particulars relative to the fall of a meteoric mass, some time ago, at the Cape. Previous to the descent of this meteorite, the attention of divers people was excited by a loud noise in the air; on looking up they perceived a blue stream of smoke from north to west. The lump sent to England, by H.M.S. Scout, weighs four pounds; where it fell the grass smoked, and the meteorite was so hot that it could not be laid hold of.—Another paper was read. It was by Sir F. Palgrave, on shooting stars, referring chiefly to two remarkable periods in the tenth and twelfth centuries, the first in April, the other in August. In both of these the stars were seen to fall like rain! One chronicle recorded that the stars were seen driven like sand before the wind!

#### ROYAL SOCIETY OF LITERATURE.

ON Thursday, Mr. Hallam in the chair, the meeting was occupied in the most interesting manner by a short paper 'On the Parthenon,' by M. Brönstedt, and a *vis à vis* explanation of his opinions respecting the sculpture of the eastern pediment, the great central portion of which our readers are aware has unfortunately not descended to our time. The component divinities of this grand mythological group have afforded scope for many theories, and many attempts have been made to restore the figures to fill up this vacuum according to the supposititious views of distinguished authors on the fine arts and classical subjects. From all preceding hypotheses M. Brönstedt differed; and he gave such admirable reasons for the restorations he proposed, that we, and we may state every person present, reaped much both of instruction and gratification from enjoying the good fortune to hear him. Of such a conversational discourse we regret that our memory does not enable us to afford any thing like an adequate idea; and we can only note a few of the speaker's learned and edifying remarks. M. Brönstedt laid down several leading principles to assist all conjectures as to the ancient mythos which formed this splendid production of art. 1st. He held that in such sculptures as in architecture every part must be balanced, and that the centre of the grouping on each side must be in perfect relation to each other. 2d. That no profane personage could be mingled with the sacred objects of

Athenian worship in such a design; but that, on the contrary, all the mythoi would bear a direct reference to the high religious circumstance represented by the artist,—the birth of Minerva from the head of Jupiter. 3d. That as there was a mythical series of dates quite as distinct as a historical series, there would be no actors upon this great occasion who were not the most ancient deities coeval with it; and, consequently, none belonging to later periods of Athenian pantheism. Upon these data M. Brönstedt proceeded with his task. From the same subject on Etruscan vases, and from the text of Pausanias, &c., he placed Jupiter in the centre, with Minerva springing from his head. The horse of Neptune, hitherto contended for as a part of the group on his right hand, he utterly rejected, as it required only a single figure to preserve the balance on this side. Two goddesses, presiding over births, were then appropriately grouped; and the Fates and Hours led the one to the extreme where Night closes the design, and the other to the extreme where the rising Day is in unison with the birth of the goddess. The chief Fate he held to be Good Fortune, for the Greeks had four, and not three such destinies of human affairs and life; and the figure hitherto considered to be Theseus, Ilyssus, or some later god or demigod, he argued, on some satisfactory grounds, to be intended for Kephalos. It is impossible, as we have said, to do justice to this very interesting explanation, which was illustrated by many incidental observations, which shewed M. Brönstedt to be a most accomplished classical scholar, and intimately conversant with every point that bore upon the antiquities of Greece. All we shall add is, that it makes us look forward with an anticipation of delight to the next meeting, when the western pediment is to be the theme of his lecture. We were sorry that we could not attend Sir R. Westmacott's lecture at the Royal Academy, on Monday evening, as we understand it embraced topics closely connected with this; and we should have been much pleased to learn what other lights his great intelligence threw over the inquiry.

#### SOCIETY OF ANTIQUARIES.

FEB. 20.—Mr. J. O. Halliwell presented a copy of a pen-and-ink drawing from the back of a letter in Dulwich College, and supposed to be a portrait of Shakspeare by Henalow, to whom the letter is addressed. In the Collection are several others of the same kind, also supposed to be contemporary likenesses.—Mr. R. L. Pearson read a paper 'On Judicial Combats and Ancient Duels in Germany,' illustrated by many curious drawings. Mr. Pickersgill exhibited a mace and battle-axe, the latter bearing the arms of Poland and the name and date of "Stanislaus 1660."

Feb. 27. Mr. Hallam in the chair.—Theodore Hook, Esq. was elected a fellow of the Society. Dr. Mantell exhibited two armills of bronze, a small gold ring in the form of a torques, and a celt of flint, found at Kollington Castle, near Brighton; also a very small bronze statue of a Cupid, with a quiver slung behind him, but no wings; two other flint celts, and various other antiquities found at several places in the vicinity of Brighton and Lewes.—Mr. Halliwell communicated some remarks on the history of the reign of King Edward the Fourth, accompanied by several documents hitherto unpublished. The first of these is a brief sermon on King Edward's accession; 2. some prophetic rhymes regarding the same; 3. two letters of

Richard Duke of York, and Richard Earl of Warwick, to Elizabeth Wydvile (afterwards queen), recommending Sir Hugh John to her favour as a husband. We understand these letters are dated some time before Elizabeth's marriage with Edward, but their reading was deferred to another meeting; as were the other documents appended to Mr. Halliwell's paper. — The names of Mr. Barnwell, Mr. Decimus Burton, Earl de Grey, and Sir R. Westmacott, were announced as auditors of the Society's accounts for the present year.

March 5. Mr. Hudson Gurney in the chair. — The remainder of the letters and documents referred to at the last meeting by Mr. Halliwell was read. — Mr. Bruce communicated two unpublished letters preserved in the British Museum relative to the Gunpowder Plot, probably found on Catesby: one was without date, from Thomas Wintour; the other, bearing the date of 1605, was written by Lord Mounteagle. Mr. Bruce gave several extracts from the examinations of the different conspirators, and observed that Lord Mounteagle was related to Catesby, and several of the other conspirators, and on intimate terms with nearly all of them; from which, and the mysterious style of Lord Mounteagle's letter, Mr. Bruce considered that Lord Mounteagle had a full knowledge of the plot. Mr. H. Smith exhibited five drawings of the Galilee of Durham Cathedral, the description of which was promised at the next meeting.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday.*—Geographical, 9 P.M.  
*Tuesday.*—Medical and Chirurgical, 8½ P.M.; Civil Engineers, 8 P.M.; Zoological, 8½ P.M.; Architectural, 8 P.M.; Society of Arts (Illustration), 8 P.M.  
*Wednesday.*—Society of Arts, 7½ P.M.; Geological, 8½ P.M.; London Institution, 7 P.M.; Medico-Botanical, 8 P.M.; Graphic, 8 P.M.; Literary Fund (Anniversary), 3 P.M.  
*Thursday.*—Royal, 8½ P.M.; Antiquaries, 8 P.M.; Royal Society of Literature, 4 P.M.  
*Friday.*—Astronomical, 8 P.M.; Royal Institution, 8½ P.M.  
*Saturday.*—Westminster Medical, 8 P.M.

#### FINE ARTS. ROYAL ACADEMY.

ON Tuesday, the 3d instant, George Jones, Esq. R.A. was duly elected keeper of the R.A. in the room of William Hilton, Esq. R.A., deceased; and Mr. William Denholm Kennedy was elected travelling student.

#### NEW PUBLICATIONS.

*The Return from Hawking.* Painted by Edwin Landseer, R.A.; Engraved by Samuel Cousins, A.R.A. Moon.

WITHOUT meaning in the least degree to underrate the productions of the severely classical and epic pencil—on the contrary, with a full appreciation and acknowledgment of their dignity and value, we confess that we generally contemplate with greater pleasure and satisfaction scenes and events of a softer and more domestic character. When the superior claims to homage of the loftier department of the art are urged upon us, without for a moment denying their validity, we frequently feel ourselves in the situation of the youth in Prior's tale (we quote from memory):—

“He owned that such might be his duty,  
But paid the compliment to beauty.”

If this be the case on ordinary occasions, it must of course be still more so when, as in the present instance, the artist invests a familiar subject with qualities which would not discredit the most elevated historical or poetical composition. The picture from which the superb print before us has been engraved excited much

too universal admiration on its appearance at the first exhibition of the Royal Academy in Trafalgar Square, to render it incumbent on us to do more than merely remind our readers that it represented the return of Lord and Lady Francis Egerton, and their attendants, from that interesting sport, once the constant and favourite amusement of persons of distinguished rank and station—the possession of hawks, indeed, being formerly considered as almost a necessary indication of nobility,—but which has now fallen into great, though undeserved desuetude. Besides the excellence of the general arrangement and effect, every one who saw that fine and attractive performance must recollect, not only the habitual spirit and skill with which Mr. Landseer had depicted the horses, dogs, and birds introduced into it, but also, perfect as those animals respectively were, the masterly manner in which he had acquitted himself of the much more difficult task of rendering them properly subordinate to the dignified and graceful forms of the noble owners, and their fair and charming children. Mr. Consins has put forth all his well-known powers in the engraving; and the result is what might naturally be expected from the united exertions of two men, each of them gifted with the most brilliant talents in his own branch of the fine arts.

#### THE DRAMA.

*Italian Opera.*—The season commenced on Tuesday, as is usual, with very poor performances. This seems a strange policy; but we suppose the managers cannot help it, and that the continental engagements of the principal singers and dancers put it out of their power to appear in England so early in the year. The large amount of the subscription, also, secured to this theatre before it opens, renders it less essential to the speculators in it to provide the highest and most expensive talent from the very beginning of their season, and throughout its whole continuance to the end. Be these matters as they may, Donizetti's *Torquato Tasso* was the entertainment of Tuesday, and bore as much resemblance in composition and value to a truly sterling opera, as a patch-work quilt of bits of finery and bits of rags does to a fine, figured Marseilles counterpane. With hardly an exception, it is, indeed, a thing of shreds and patches, worn out before in many a variety of ways. Every bar echoed sounds familiar to every ear; and the *ensemble* was a platitude of the most unstimulating order. A Signor Coletti—a name very like Coletti—who sustained the character of *Tasso*, is a good barytone, and deserved the applause bestowed upon him. Signor Ricciardi is an agreeable singer, but has not powers for this large house; and in straining his voice out of all compass to fill it (a rare fault with well-taught Italian musicians, who generally know their measure, and do not attempt to go beyond it), lost the favourable impression made by his less ambitious efforts. The female *débütante* here, Mlle. Varny, we fear, has not the quality of voice to please an audience. It differs entirely from the tone which touches the feelings; and she does not appear to have any feelings of her own to convey to her execution that substitute charm which the deficiency demands. The ballet was as weak as the opera.

*Drury Lane.*—It is with regret we notice that Mr. Hammond's bankruptcy caused this theatre to be suddenly closed on Saturday; and that it has only been kept open during the week by the generous devotion of Macready to the interests of his less fortunate professional

brethren. Hammond, we believe an honest and worthy man, had adventured on an undertaking beyond his powers, and being left in the lurch where he looked for supplies, no sooner had the two royal nights (the marriage, and the personal visit of the sovereign) thrown a little money into his treasury, than he was visited by the tender mercies of Creditors and the Law, and an end put to his managerial career. For the sake of the performers and the number of other persons who derive a subsistence from the stage, and for the sake of the drama itself, we sincerely hope that this house may be kept open for the season. Wise would it be in its proprietary if they could give it to a Macready for nothing, to raise its character and put it upon a solid basis; but we presume his Haymarket engagements render any prospect of having him at Drury Lane impossible. What is the next best course we cannot tell,—opera will probably be tried, and there is a fair portion of talent in that line.

*Covent Garden* gave the Queen and Prince Albert a gallant reception on Friday: her majesty's box and ante-room, we are told, were beautifully fitted up on the occasion. There has been no novelty in the performances, and it is well to find old friends succeed so much as to render new unnecessary. On Monday (day-time) there was an interesting spectacle on the stage, viz. the presentation of a cup to Mr. C. Kemble, which had been subscribed for by a number of his admirers and friends. His grace the Duke of Beaufort made an eloquent and feeling address in offering this tribute to Mr. Kemble's acceptance, to which he returned an equally sensible and feeling reply. The only regret we have heard uttered respecting this matter has been, that very many persons who would have wished to join in this testimony of their high esteem for the individual in question never heard of the design, and were consequently prevented from doing that which would have been so agreeable to them. For ourselves, we can truly say, that we are extremely sorry never to have had an intimation either of the subscription or of the meeting at Covent Garden.

*Adelphi.*—Another successful piece, founded on “Nicholas Nickleby,” by Mr. Stirling, has been produced at this enterprising theatre. It consists of rather detached scenes affecting the sad career of poor unhappy *Smike*, and concludes with his melancholy but unavoidable death. *John Brodie* (Beverley) in London, humorously sustains the burden of the comic division; with the aid, to be sure, of *Mantolini* (Yates) at the “*demmed mingle*,” and his wife (Mrs. Foobroke) no longer the fond and flattered *Madame*, and also of Buckstone, whose face and dress of *Noggs* are irresistibly ludicrous. Wilkinson's *Squeers* is also a good piece of individualisation; and, on this occasion, the right succession of his line is excellently demonstrated by Master Bruntton, whose *Young Whackford Squeers* is quite delightful. The performers are thrown into several tableaux with good effect; but though well acted throughout, the essence of the drama is again in the *Smike* of Mrs. Keeley. Nothing can be more touching than her personation of this forlorn and helpless creature; and the scene of his calm and peaceful dying is a *chef d'œuvre* of dramatic art. There is, we believe, hardly a dry eye in the house; it is so true, so natural, and yet unforced and unexaggerated, that the painful emotions are kept under, and both the judicious and the unskillful can only weep their admiration. With *Poor Jack* increasing in facility

and effect every night, no wonder that the *Adelphi* always shews but a crowd of faces directed to the updrawing of the curtain.

The *Haymarket* is announced to open on Monday week.

A *German Operatic Company* is announced to open at the St. James's Theatre on Easter Monday.

The *Covent Garden Theatrical Fund Anniversary* is, we observe, fixed for the 18th, and with a host of attractions. With such a list of stewards, and such musical entertainments as are provided, we cannot but expect a gratifying meeting.

#### VARIETIES.

H. B. has been rather sleepy of late, but the Privilege question has awakened him. We have three novelties before us, Nos. 626, 7, 8. The first is from "Faust," and represents Lord John as Mephistophiles following the phantom Privilege, with Peel as Faust eagerly striding after him, and pulling down from a tree a branch inscribed "Public Opinion;" the aspects and attitudes of both are worthy of Retsch. The next is the "New Leader of the Opposition," a capital whole-length of Col. Sibthorp with, in one hand the reduction of the vote to Prince Albert; in the other, a commission to examine the number of government commissions. The last of the set is "Ulysses and the Syrens," an admirable pictorial composition. Sir R. Peel, in a vessel with a goose-head prow, is getting lashed to the mast by his companions, Sugden, the Recorders of London and Dublin, and others; whilst Lord J. Russell, O'Connell, and Wakley, as syrens (and droll ones they look) among the rushes on the shore, are fluting, harping, and singing away with most ludicrous expressions of countenance. It is one of the prime caricatures, and likely to be most popular.

*Nomenclature of the New French Ministry.*—At one of the "industrial" meetings where the newspapers are read for the edification of the lower orders, all of whom are now instructed to be petitioners, debaters, and politicians, a whimsical idea was furnished of the composition of the new French ministry, by the manner in which their names were pronounced. From this it appeared that they had a President in *Tears* (Thiers), *Co-Bears* (Cubières) for War, and a *Lion* (Leon) for the Interior. That the Minister of Finance was one of the *Losers* (Pelet de la Lozère), and the Minister of Public Works a *Jobber* (Janbert); that they had a *Ruse* in (Roussin) for the Marine, *Cows* in (Cousin) for Commerce, and a *Goose* in (Goussin) for Public Instruction. In short, excepting Vivien and Remusat, that the majority was a ministry of *beasts*, who had in proof of their natural history sent *Geese* hot (Guizot) as their representative to England.

*Kew Gardens.*—We did not, last week, take the trouble to re-assert the truth of the paragraph inserted among our Varieties relative to Kew Gardens, though it was contradicted in a demi-official tone by a Sunday newspaper. It was enough for us to know, that, whatever the alterations purposed were, they had been abandoned; but we were nevertheless glad to see this fact stated in the House of Lords in reply to some observations made by the Earl of Aberdeen. Wherever early French beans or asparagus may be wanted, therefore, for any department of government, it is not likely that they will be raised in Kew Gardens at the cost of destroying its unrivalled botanical treasures.

*Kentish Periodical.*—According to our custom with all new periodicals sent to us, we notice the appearance of the first number of the *The Kentish Coronal*, edited by H. G. Adams, the author of "The Ocean Queen," a poem which, at the time of its publication, received our commendations. This little magazine abounds rather too much in poetry, though many of its poetical pieces are really excellent. Both in name and form it looks like a *growing Annual*; the mention of which, by association of idea, reminds us of a series of papers commenced in its pages, promising to be of great local interest, "On the Vegetable Productions of Kent," by the author of "The Field, the Garden, and the Woodland." We sincerely wish success to *The Coronal*, and recommend it to the patronage of "the men and maids of Kent" as a very pleasing little miscellany.

*Climate.*—An article on the Russian possessions in America, in the "Bibliothèque Universelle de Genève," gives a table of the difference of climate between the old and new world, which is striking enough:—

Western Europe.	Latitude.	Mean Temperature.
Nantes .....	47° 13'	12° 6'
Perpignan.....	42 42	15 3
Naples.....	40 50	17 4
Eastern America.		
Quebec.....	46° 47'	8° 6'
Cambridge.....	42 25	10 2
New York.....	40 40	12 1

Mr. Haydon, whose successful lecturing on the fine arts we lately noticed, is now giving a course at the University of Oxford by leave of the Vice-Chancellor. They cannot have a more zealous or able apostle, and we rejoice to think that this great seat of learning is benefiting by his labours in this delightful adjunct to book knowledge.

W. James Ward, Esq. A.R.A., the mezzotinto engraver to their late majesties, and whose productions are so well and favourably known to the public, died on Sunday last.

#### LITERARY NOVELTIES.

##### LIST OF NEW BOOKS.

Wind, north-east on the 27th ult. and two following days; on the 1st and 2d east; since, north-east.

The evening of the 27th and morning of the 28th overcast; a few small flakes of snow fell about 8 A.M. on the 28th; since generally clear, except the morning of the 3d, when again a little snow fell.

Edmonton. CHARLES HENRY ADAMS.

#### TO CORRESPONDENTS.

"Mancunianis" is a wag; it is nevertheless no great matter, to any but the parties concerned, who died first, and who preached the other's funeral sermon. We have not been that way lately, but should be very happy on such a journey encounter our merry grave critic. We are sorry to postpone the Anniversary Report of the Geological Society till next Saturday.

## THE ROYAL CORONATION PICTURE.

MESSRS. HODGSON and GRAVES have the honour to announce that, by Her Majesty's Special Permission, they will exhibit, in their Gallery, during the next week, the **GRAND HISTORICAL PICTURE of HER MAJESTY'S CORONATION**, painted by GEORGE HAYMER, Esq. Historical and Portrait Painter to the Queen. Admission by Tickets only.—The Subscribers to the Engraving are respectfully informed that the Picture will remain with the Publishers for a few days only.  
6 Pall Mall, March 7.

**AN URGENT APPEAL to the Literary and Scientific World, and the Public in general, in behalf of the Family of the late Mr. Donovan, the eminent English Naturalist.** This distinguished and highly gifted individual, who laboured in the field of natural science for half a century, with what zeal and ability he exerted his talents and genius in advancing the science, literature, and the fine arts of this country, his works will better explain than any thing emanating from his feeble abilities; but it is deeply to be deplored that, after devoting the whole period of his valuable life, and expending a fortune in his zealous endeavours to elucidate the natural history of his country, he died in want, and left a family of five daughters in the deepest distress, with nothing for their future support but his manuscript works; and their last and only resource for defraying incidental expenses in publishing the works lies in this appeal. The smallest contribution is most earnestly solicited for that purpose, and will be very thankfully received by the under-mentioned, or by Mr. Don, at the Linnean Society, Soho Square.

Gratis.

**THE NEW LIBRARY TERMS,** on which Families and Book-Societies throughout Great Britain are supplied with the new Publications for perusal, can now be obtained (postage free) on application to Messrs. Saunders and Oiley, Publishers, Conduit Street, Hanover Square. Monthly supplies, in proportion to the number of members forming each Society, are regularly forwarded; and to meet the increasing demand for new books the publishing resources of this extensive establishment are added to the Library.

## QUEENS of ENGLAND.

(Dobbs and Co. 11 Carey Street, Lincoln's Inn, and by order), full-length, splendidly coloured, authentic Portraits, with Memoirs—Anne Boleyn and Jane Seymour (Holbein); Elizabeth (Zucchero); Philippa; Henrietta Maria (Vandyck); Mary and Anne (Kneller); Jane Grey (Vander Werf); also, upwards of Eighty Portraits of celebrated Women of all Nations—Blaise, Mary, Queen of Scots, Potarch's Laura, Marie Antoinette, the Fair Maid of Kent, &c. &c. Lists of which would be forwarded to applicants. In progress, Eleanor of Aquitaine, Isabel of Angoulême, Elizabeth Wyville, Margaret of Anjou, Mary I., Katherine of Arragon, Katherine Howard, Anne of Cleves, Katherine Parr, Christine of Sweden.

**EDINBURGH REVIEW, No. 143.**—It is requested that Advertisements and Bills intended for publication in this forthcoming Number of the Edinburgh Review, be sent to the Publishers on or before Monday, March 16.  
39 Paternoster Row, March 16th.

## THE CANADIAN NATURALIST.

By P. H. GOSSET, Cor. Mem. of the Nat. Hist. Soc. of

Montreal, and of the Acad. Sci. of Quebec.

This volume contains brief and popular notices of subjects in

different departments of Natural History, not systematically

arranged, but as they might be supposed to occur to a Naturalist

wandering in the woods and fields of Canada. Some of the more

prominent phenomena of Natural Philosophy, the habits of

quadrupeds, Birds, and Insects, the general appearance, time of

flowering, &c. of Plants, are briefly described in the form of

dialogue, interspersed with characteristic anecdotes; the whole

embracing the course of the Seasons throughout the year, and

presenting to the reader a picture of the face of Nature in that

interesting country.

Forty-four Illustrations of the most remarkable Animal and

Vegetable Productions are embodied in the Text. Post 8vo.

18s. cloth.

John Van Voorst, 1 Paternoster Row.

## BOOKS PUBLISHED THIS DAY.

Commencement of the French Revolution to the Restor-  
ation of the Bourbons.**

By ARCHIBALD ALISON, F.R.S.E.  
 Seven Volumes are published, handsomely printed in 8vo.  
 price 15s. each.

The Eighth is in the press.

"No work could have made such progress in national opinion  
 without substantial qualities. Its vigour of research and its  
 manliness of principle; its accurate knowledge, and its anima-  
 tion of style, have been the grounds of its remarkable public  
 favour, as they are the guarantees for its permanent popularity."  
 —Blackwood.

"The History of Europe during the French Revolution" is  
 indispensable to all those who are forming collections on this  
 subject. It is the completion of them all.—"Preface to the French  
 Translation, by M. Puyguit."  
 "The History of Europe during the French Revolution" is by  
 far the most remarkable historical work of the last century."—  
*Foreign Quarterly Review*.

Volumes, beautifully embellished with Portraits, Vignettes, &c.

II.

**THE WIDOW MARRIED.**

A SEQUEL TO "THE WIDOW BARNABY."

By MRS. TROLLOPE.

In 3 vols. post 8vo. with 21 humorous Illustrations by R. W. Buss, bound.

"Mrs. Trollope is, beyond a doubt, one of the cleverest and most remarkable writers  
of the day. With a quickness of observation that takes in the whole object at a glance,  
an insight into motives that seem instinctive, a keen perception of the ridiculous, and  
strong powers of humorous delineation, she is the person of all others to expose preten-  
sion or unmask hypocrisy."—*Quarterly Review*.

III.

**PRINCE ALBERT,  
AND THE HOUSE OF SAXONY.**

By FREDERIC SHOBERL, Esq.

In 1 vol. post 8vo. (of nearly 300 pages), elegantly bound, and embellished with a fine  
Portrait of the Prince, price only 5s. 6d."The best and most authentic work on the subject of the prince-consort and his  
family."—*John Bull*.

IV.

**LADY JANE GREY;  
AN HISTORICAL ROMANCE.**

By the Author of "Royston Gower," "Fair Rosamond," &amp;c. 3 vols.

"This work does honour to its author, and places him in a front rank among the  
most eminent cultivators of this species of literature."—*Literary Gazette*.

V.

**THE COURT AND CAMP OF  
RUNJEET SING.**

By the Hon. G. W. OSBORNE,

Military Secretary to the Governor-General of India.

1 vol. 8vo. with Sixteen Engravings from original Drawings, taken on the spot,  
15s. bound."This book has the solid value of history, and the romance of an eastern fiction."—*Examiner*.

VI.

**MEMOIRS AND LETTERS OF  
MADAME MALIBRAN,**With Notices of the Progress of the Musical Drama in England, 2 vols. post 8vo.  
with Portrait, 21s. bound."These Memoirs are full of interesting details, much of which is entirely new to the  
public, and of a nature to give new ideas and impressions of the extraordinary woman  
to whom they relate. We could fill several columns very pleasantly with those singular  
personal anecdotes and traits with which these volumes are filled; but extracts are  
unnecessary, as the book will be universally read. In addition to the chief Memoir,  
there is a large body of miscellaneous anecdote, and a selection of Malibran's letters, all  
singularly characteristic and amusing."—*Naval and Military Gazette*.

VII.

**A PILGRIMAGE TO PALESTINE.**

By the BARON GERAMB.

2 vols. post 8vo. with Illustrations, 21s. bound.

"These volumes are the most curious and interesting of their kind that we have  
lately met with. They may be looked upon as the first written record ever made public  
of the actual daily observations and feelings of a pilgrim to the Holy Sepulchre, and  
the other most famous scenes of Holy Writ. The strong and evidently sincere religious  
feeling which pervades the volumes throughout will give them a strong interest with  
the religious portion of the community."—*Naval and Military Gazette*.**HENRY COLBURN, PUBLISHER, 13 GREAT MARLBOROUGH STREET.**

ORDERS RECEIVED BY ALL BOOKSELLERS.

### REVIEW OF NEW BOOKS.

*Annals of the First Four Years of the Reign of Queen Elizabeth.* By Sir John Hayward, Knight, D.C.L. Edited from a MS. in the Harleian Collection. By John Bruce, Esq. F.S.A. Small 4to. pp. 114.

THIS new product of the Camden Society is well worth the reputation for judicious selection and excellent editing which the best of its preceding publications have obtained. It is, indeed, a work of high historical interest, and throws a light on several important, as well as disputed transactions, besides exhibiting to us such lively pictures of the doings and pageants of these eventful years, as to afford the entertainment of admirable description (such as might honour the pen of a Scott or James), whilst it develops the springs upon which such momentous occurrences hinged.

The Introduction, by Mr. Bruce, belongs to the most valuable class of such compositions. It is full of information, and given with rare judgment. As a general essay on the period it will be read with much instruction, and the new particulars relative to Hayward are both personally and literarily curious. We have been extremely pleased with it altogether, and with his notes; for there is all that the subject required, and nothing overdone or extended beyond what was necessary.

In proof of this, we shall beg leave to quote a little:—

"Amongst the many consequences which followed upon the introduction of printing into England, one of the earliest was, that it made our history popular. Caxton's '*Chronicle*' effected, in that respect, a change which, half a century later, would have been the result of the dissolution of the monasteries. It withdrew history from the exclusive care of the church, and taught her to speak the language, and appeal directly to the feelings, of the people. But the vernacular chroniclers who succeeded the monastic writers of history were little conscious of the importance of their task. They followed in the footsteps of the humblest of their predecessors, and seldom aimed at any higher mark than that of being found faithful and diligent annalists. They were industrious collectors of facts, pains-taking chronologists, honest narrators, but, as a body, were totally devoid of that power of description which makes manifest the truth respecting past events, in such manner as to render it conducive to the instruction of mankind. In such hands history lost much of its usefulness and all its dignity, and greatly is it to be regretted that this depression of historical literature took place at a time when, in other departments of human knowledge, our intellectual strength was at its height; when poetry shone with pre-eminence, and the profoundest depths of theology were investigated with an acuteness which has never been surpassed. No doubt there were many men who saw and deplored the state of things upon which I am commenting, and there were, at any event, two who endeavoured to amend it—Camden and Hayward; united in their lives as the joint historiographers of King James's College at Chelsea, and now, after the lapse of two cen-

turies, again brought together in name,—the one as the author of the following work, and the other as the patron of the Society by whom it is published. Camden and Hayward took, indeed, different paths, and I by no means seek to place them upon an equality; it is honour enough for Hayward if it be allowed that both were well acquainted with the great classical models of historical composition, and wrote with minds imbued with a strong persuasion of their many excellent qualities, and an anxious desire to catch some portion of their spirit; and that whilst Camden was setting forth in pure and simple Latin his admirable '*Britannia*,' and his '*Annales*,' and was placing before the world some of the most valuable of the foundations of English History in his collection of *Chronicles*, Hayward was composing, in our own language, works which, notwithstanding their many defects, were of a higher character, and approached more nearly to a better description of historical writing, than any which had then been published.

"Hayward spared no pains to gather information, and often obtained it from sources the most difficult to reach. I have already noticed this fact respecting his *Norman Kings*; his '*Edward VI.*' was the first history founded upon the valuable journal of that sovereign, to which Hayward had access through the liberality of Sir Robert Cotton; and a comparison of various passages in the following work with the diplomatic correspondence relating to the same facts, which has since been published, has led me to the conclusion that he must have had access to many public or official documents. His fidelity was equal to his diligence. Mistakes there are in his works,—and who can write without them? and prejudices and superstitions will occasionally peep forth; but the following work contains in its highly favourable picture of Queen Elizabeth,—whose memory Hayward had certainly no personal cause to revere, and dispraise of whom would not have been unacceptable in the court of her successor,—a striking proof that the author could follow truth even at the sacrifice of his own feelings. But Hayward's claim to consideration and regard is not founded on his style, or his diligence, or his fidelity, but on the fact to which I have before alluded,—that he was amongst the first of those who sought to make our history something better than a mere extended chronology. It was his desire, 'by the light of language,' to use the expressive words of Lord Bacon, 'to place before our very eyes the movements of the times, the characters of persons, the hesitations of council, the course and flow of actions, as of waters; the hollow-ness of pretences, the secrets of empire.' To do all this, Lord Bacon continues, 'is truly a work of great labour and judgment,' and if it be so, great should be the honour, and many the allowances, which they meet with, who first lead the way towards its accomplishment."

Hayward's domestic enjoyments seem to have been of the least enviable kind, and Mr. Bruce says:—

"The bitter feelings which Hayward entertained against womankind lead to inferences not very favourable to his lady: '*Q wives!*'

he exclaims, when commenting upon the conduct of the Duchess of Somerset in his '*History of Edward VI.*,' 'the most sweete poison, the most desired evill in the world. Certainly as it is true, as Syracides saith, that there is no malice to the malice of a woman, so no mischiefes wanteth where a malicious woman beareth away. A woman was first given to man for a comforter, but not for a counsailor, much lesse a controller and director, and, therefore, in the first sentence against man, this cause is expressed, because thou obeydest the voice of thy wife' (p. 84, edit. 1630). Notwithstanding their mutual disagreements, it may be inferred from their wills that both Hayward and his wife lived upon friendly terms with her relations."

The Introduction concludes modestly, but with an uncalled-for doubt:—

"When I recur to what I have written, and observe the length to which my observations have extended, I feel apprehensive that I may be thought to have occupied a greater space than is due to my subject. It should, however, be borne in mind, that the present publication completes the series of Sir John Hayward's works, and affords, therefore, a proper opportunity for endeavouring to add something to the few biographical particulars hitherto known concerning him. Little as I have been able to effect, I would fain hope that my mite will be acceptable, as a contribution, not only to our literary history—a subject which well deserves the attention of the Camden Society—but to two important works, the non-existence of which is daily more and more deplored—a *History of Suffolk*, and an *Athenæ Cantabrigienses*. The former is, I trust, happily in progress, under the care of Mr. Gage Roke-woode; for the latter there exists an abundance of materials: but where is the scholar whose zeal and learning are to secure for Cambridge advantages as great as those which Oxford derives from the conjoint labours of Anthony Wood and Dr. Bliss?"

We shall now proceed to the history itself, and our readers will, we think, be amused in these days of our Queen's public appearances on great state occasions, to contrast them with the customs of our elders in the "merrie days of Queen Bess:—"

"And, for that the presence of the Prince is of greatest moment to establish affayres, the Queene, the next day after her title was proclaimed, removed from Hatfield, in Hartfordshire, where shee then lay, towards London; and was upon the way incountred and intertaind in all places with such a concourse of people, with soe lively representations of love, joy, and hope, that it far exceeded her expectatione. The people of all sorts (even such whose fortunes were unlike either to bee amended or impaired by change) went many myles out of the City to see her, some upon particular affectione to her person, others upon opinions of good to the State, some upon an ordinary levity and delight in change, and not a few because they would doe as others did; all with like fervency contending who should most neerly approach unto her, who should most cheerfully bestow upon her all honour."

able titles and happy wishes. Now, if ever any person had eyther the gift or the stile to winne the hearts of people, it was this Queene; and if ever shee did expresse the same, it was at that present, in coupling mildnesse with majesty as shee did, and in statly stouping to the meanest sort. All her facultyes were in motion, and every motion seemed a well-guided action; her eye was set upon one, her ears listened to another, her judgment ranne upon a third, to a fourth shee addressed her speech; her spirit seemed to be every-where, and yet so intyre in her selfe, as it seemed to bee noe where else. Some shee pityed, some shee commended, some shee thanked, at others shee pleasantly and wittily jeasted, contemning noe person, neglecting noe office; and distributing her smiles, looks, and graces, soe artificially, that thereupon the people againe redoubled the testimonies of their joyes; and afterwards, raising every thing to the highest straine, filled the eares of all men with immoderate extolling their Prince. Shee was a Lady, upon whom nature had bestowed, and well placed, many of her fayrest favores; of stature meane, slender, streight, and amiably composed; of such state in her carriage, as every motion of her seemed to beare majesty: her haire was inclined to pale yellow, her foreheade large and faire, a seemeing sete for princely grace; her eyes lively and sweete, but short-sighted; her nose somewhat rising in the midst; the whole compasse of her countenance somewhat long, but yet of admirable beauty, not so much in that which is tearmed the flower of youth, as in a most delightfull composition of majesty and modesty in equall mixture. But without good qualities of mynde, the gifts of nature are like paynted floweres, without eyther vertue or sappe; yea, sometimes they grow horrid and loathsome. Now her vertues were such as might suffice to make an Aethiopian beautifull, which, the more a man knowes and understands, the more hee shall admire and love. In life, shee was most innocent; in desires, moderate; in purpose, just; of spirit, above credit and almost capacity of her sexe; of divine witt, as well for depth of judgment, as for quicke conceits and speedy expeditions; of eloquence, as sweete in the utterance, soe ready and easie to come to the utterance: of wonderfull knowledge both in learning and affayres; skilfull not only in the Latine and Greeke, but alsoe in divers other forraigne languages: none knew better the hardest art of all others, that is, of commanding men, nor could more use themselves to those cares without which the royall dignity could not be supported. Shee was religeous, magnanimous, mercifull, and just; respective of the honour of others, and exceeding tender in the touch of her owne. Shee was lovely and loving, the two principall bands of duty and obedience. Shee was very ripe and measured in counsaile and experience, as well not to lett goe occasions, as not to take them when they were greene. Shee maintained Justice at home, and Armes abroad, with greates wisdom and authority in eyther place. Her majesty seemed to all to shine though courtesy: but as shee was not easy to receive any to especiall grace, so was shee most constant to those whom shee received; and of great judgment to know to what point of greatness men were fit to be advanced. Shee was rather liberall than magnificent, making good choys of the receivours; and for this cause was thought weake by some against the desire of money. But it is certaine that beside the want of treasure which shee found, her con-

tinuall affayres in Scotland, France, the Low Countries, and in Ireland, did occasions greates provisione of money, which could not bee better supplied, than by cutting off eyther excessive or unnecessary expense at home. Excellent Queene! what doe my words but wrong thy worth? what doe I but guild gold? what but shew the sunne with a candle, in attempting to prayse thee whose honour doth flye over the whole world upon the two wings of Magnanimity and Justice, whose perfection shall much dimme the lustre of all other that shall be of thy sexe?

"Upon the fourteenth day of January in the afternoon, shee passed from the Tower through the City of London to Westminster, most royally furnished, both for her persone and for her trayne, knowing right well that in pompous ceremonies a secret of government doth much consist, for that the people are naturally both taken and held with exteriour shewes. The Nobility and Gentlemen were very many, and noe lesse honourably furnished. The rich attire, the ornaments, the beauty of Ladyes, did add particular graces to the solemnity, and held the eyes and hearts of men dazeled between contentment and admiration. When shee tooke her coach within the Tower, shee made a solemne thanksgiving to God, that hee had delivered her noe lesse mercifullly, noe lesse mightily from her imprisonment in that place, then hee had delivered Daniell from the lyones denne: that hee had preserved her from those dangers wherewith shee was both invironed and overwhelmed, to bring her to the joye and honour of that daye. As shee passed through the City, nothing was omitted to doe her the highest honours, which the Citizens (whoe could procure good use both of purses and inventiones) were able to perfourme. It were the part of an idle orator to describe the Pageants, the Arkes,\* and other well-devised honours done unto her; the order, the beauty, the majesty of this action, the high joye of some, the silence and reverence of other, the constant contentment of all; their untired patience never spent, eyther with long expecting (some of them from a good part of the night before) or with unsatiable beholding the Ceremonies of that day. The Queene was not negligent on her part to descend to all pleasing behavioure, which seemed to proceede from a naturall gentleness of disposition, and not from any strayned desire of popularity or insinuation. Shee gave due respect to all sorts of persones, wherein the quicknesse of her spirit did worke more actively than did her eyes. When the people made the ayinge ring with praying to God for her prosperity, shee thanked them with exceeding liveness both of countenance and voyce, and wished neither prosperity nor safety to her selfe, which might not bee for their common good. As shee passed by the Companies of the City, standing in their liveryes, shee tooke particular knowledge of them, and graced them with many witty formaltes of speech. Shee diligently both observed and commended such devises as were presented unto her, and to that end sometimes caused her coach to stand still, sometimes to be removed to places of best advantage for hearing and for sight; and in the mean time fairly intreated the people to be silent. And when shee understode not the meaning of any representation, or could not perfectly heare some speeches that were made, shee caused the same to be declared unto her. When the Recorder of the City presented to her a purse of crimson sattin, very richly and curiously

\* "i.e. The arches."

wrought, and therein a thousand markes in gold, with request that shee would continue a gracious Mistresse to the City; Shee answered, That shee was bound in a naturall obligatione so to doe, not soe much for ther gold, as for ther good will: that as they had beene at great expence of treasure that daye, to honour her passage, so all the dayes of her life shee would be ready to expend not only her treasure, but the dearest droppe of her blood, to maintayne and increase ther flourishing estate. When shee espyed a pageant at the Little Conduit in Cheape, shee demanded (as it was her custome in the rest) what should be represented therein: Answer was made, that Time did there attend for her: 'Time' (sayd she) How is that possible, seeing it is tyme that hath brought me mee hither? Here a Bible in English, richly covered, was let downe unto her by a silk lace from a child that represented Truth. Shee kissed both her hands, with both her hands shee received it, then shee kissed it; afterwards applied it to her breast: and, lastly, held it up, thanking the City especially for that gift, and promising to be a diligent reader thereof. When any good wishes were cast forth for her vertuous and religious government, shee would lift up her hands towards Heaven, and desire the people to answer, Amen. When it was told her that an ancient citizen turned his heade backe and wept: 'I warrant you' (said shee) 'it is for joy;' and so in very deepe it was. Shee cheerfully received not only rich giftes from persons of worth, but nosegayes, floweres, rose-marie branches, and such like presents, offered unto her from very meane persones, insomuch as it may truly be saide, that there was neyther courtesie nor cost cast away that daye upon her. It is incredible how often shee caused her coach to staye, when any made offer to approach unto her, whither to make petition, or whither to manifest their loving affectiones. Hereby the people, to whom no musick is soe sweete as the affability of their prince, were so strongly stirred to love and joye, that all men contended how they might most effectually testify the same; some with plausible accommodations, some with sober prayers, and many with silent and true-hearted teares, which were then seen to melt from their eyes. And afterwards, departing home, they so stretched every thing to the highest streyne, that they inflamed the like affectiones in others. It is certaine that the high humilities, joyined to justice, are of greater power to winne the hearts of people than any, than all other vertues beside. All other vertues are expedient for a prince, all are advised, but thes are necessary, thes are enjoyned; without many other a prince may stande, but without thes upon every occasion he standes in danger. The day following, being Sundaye, shee was, with all accustomed ceremonies, crowned in the Abbey Church at Westminster; having made demonstration of soe many princely vertues before, that all men were of opinion that one crowne was not sufficient to adorne them. The coronation ended, shee passed in greates state to Westminster Hall, and ther dined."

Three hundred years make a wonderful difference in customs and feelings; but the lesson, the real lesson of truth between sovereign and subject, is to be learned under all the variations. We will not, however, preach about it; but only express our hope that Victoria may reign as long as Elizabeth, and see the country equally respected abroad and prosperous at home; that she may individually enjoy much greater felicity; and that no stain may ever

rest on the throne which she filled;—none such as attached to Elizabeth's conduct in regard to the unfortunate Mary. But on this subject we shall reserve two or three of our next week's columns.

*The Fall of Saul. A Sacred Epic Poem.* By J. G. Seymer, M.A. of St. Alban's Hall, Oxford. 12mo. pp. 301. London, 1839.

We have seldom seen a volume of poetry published with such a splendid list of subscribers (both in quality and numbers) as graces the present work: we only wish that the book was more worthy of the patronage bestowed upon it. There are but few subjects better adapted for an epic poem than the one chosen by our author, but the materials are such as only a master-hand could mould into the forms of Beauty and Terror; the life and spirit necessary to awaken anew our interests in such a work, could only be infused by a true poet, and such Mr. Seymer is not. There is a flatness in his style, a dead formality, a cold measuring out of rhythm and metre, made up of "ersts" and "then spoke's," "to whom's," and suchlike hackneyed beginnings, as every schoolboy adopts when first he attempts blank verse. There is no fire, no soul, nothing that kindles up our feelings, throughout the whole volume; even the scene where the Witch of Endor calls up the spirit of Samuel is dry, hard, and uninteresting. Let any one, who at all understands the nature of poetry, take the following description of the cave, and say if there is any thing in it of the grand and fearful, with which such a subject ought to be clothed, and in the presence of a sorceress and a seer, who throw into the shade all imaginary *diablerie*:—

"By this the King  
Before the cavern stood, when Albion thrice  
His palms together smote, and at the sign  
Beneath the utmost verge of that huge arch,  
Appeared the sorceress, her aspect such  
As when by the Asphalene lake, she held  
Communion with the fiend. A lamp she bore,  
That 'mid ten thousand shapes of crystal growth,  
(Which o'er the rock wide incrustation spread,)  
Did multiply itself into a light,  
More lustrous far than ever on the feast  
Of Orient despot shone. The Hebrew king  
From that wild form recoiled; as with a glance,  
That seemed by meteor kindled, Edris scanned  
His bright majestic form; her bosom passed  
The flash of dark suspicion; yet no eye  
Might read upon the tablet of her brow  
Her thoughts, as thus she spake:

"What seek ye here?"

This alone, in a subject which offers as rich material as the witch scene in "Macbeth," is a convincing proof how unfit our author is to handle the matter he has fixed upon for his poem. But we will bring stronger proof. Here is the passage in which the spell is muttered, and the seer appears:—

"Whom shall I bring  
Thee up?"  
To whom the Hebrew king: "Bring up  
Elkanah's son."

He said, and on the lips  
Of Edris are the words that once could search  
The unseen world. Breathless the son of Kiah  
Beheld, but heard not. Wanly gleamed the lamp,  
As by a mist involved bred from the strife  
Of hope and fear (within his breast that raged),  
Or from the pining of his nature, worn  
By fast and vigil.

Now had Syria's clime  
Half swept the hemisphere of night, as ceased  
The muttered spell, and from the earth arose  
What seemed a man, who long with things that draw  
No growth from dust, high brotherhood had made.  
'Tis won—the boon of fear is won, and he  
For whom the wail was erst at Ramah raised,  
Hath left the viewless clime which, far or near,  
Must hold awhile the race from Adam born,  
'Twixt this probation hour and final doom,  
In pause of destiny, that ends the war  
Of good and ill within each spirit waged  
From birth to death, in peace, or which is hung  
Rapture of bliss or woe, to which the thrill

Of utmost joy or grief that in this sphere  
May shake the heart, were coldest apathy.  
As where the pencil's course hath been, appears  
Some shape of hues impalpable, so stood  
That shadow by the sorceress alone  
Descried. Upon the king a mournful glance  
He turned, whilst on the mind of Edris came  
Remembrance of the warning by the fiend  
Pronounced."

How inferior is all this to the few solemn words in which the scene is narrated in the Bible! Take but the witch's answer to Saul when he inquires the form of the seer, and the effect produced on the king:—

"An aged man  
He seems, of awful aspect; from the earth,  
Mist-like, he rises, and around him flow  
A mantle's folds."

She said. And, at her words,  
Instant upon the king conviction rushed,  
Unneeding attestation of the sense  
Corporeal. In his soul the present seer  
He felt; and toward the spot whereon the witch  
Her gifted gaze had fixed, he bowed him low."

Compare this with the following verse of Scripture, 1 Samuel, xxviii. 14:—

"And he said unto her, What form is he of? And she said, An old man cometh up; and he is covered with a mantle. And Saul perceived that it was Samuel, and he stooped with his face to the ground, and bowed himself."

How stands the witch of Endor when Samuel appears before her, when she sees "gods arise out of the earth?"—the poet sayeth not. How looks Saul—his lips quivering; his knees tottering; his glazed eyes fixed on that lurid light from which bursts a form that he feels, yet cannot see? Reader, we have told thee how. All the light and shade—the expression of the countenances—the sounding of voices, hollow, sepulchral, sinking upon the very heart, are left to thy imagination: the author ought to have done so, but could not express them. We write this notice more in "sorrow than in anger;" for although Mr. Seymer has failed utterly, and in every sense of the word failed, in doing justice to the mighty subject he has taken in hand, still he has approached it with a feeling of veneration. His epic is in general free from that bombast and nonsense in which other writers of the present day have clothed similar productions. But this is no excuse for his taking up a theme which would have stranded the genius of a Wordsworth;—to which the greatest poet of the present day must have failed in doing justice. It is like one of Homer's pigmies stepping up and attempting to bear on his tiny shoulders the burden of Atlas. Even Cowley, in his "Davideis" (in many senses a subject very similar), has totally failed. Our author is inferior as a poet to Cowley by many, many degrees! Another great fault—he has attempted to imitate the language of Milton; and he moves through the heroic thunder of the blind bard like a tall, sickly lad in the armour of Achilles, fainting and staggering in the ranks of battle. Here is a specimen:—

"As when in times long past, from demon's voice,  
Or human fraud with demon malice leagued  
(Though of that league unwitting), came the rhyme  
Oracular, or from the Delphic rock,  
Or from Dodona's forests, or where else  
In Libya's desert, or by Nilus' stream,  
By Heaven's high sufferance, the infernal power  
Most reigned."

Who that has read the first book of "Paradise Lost," lines 506 to 520, cannot, at a glance, detect this poor imitation?

In conclusion, we would advise the author in future to content himself with soaring according to the strength of his wings. He has not the strong plumes of the sky-cleaving eagle, and makes but a weak figure when he attempts to leave "dull earth behind him." Still, he

can do something; and that, too, far superior to the general run of the verses published in the present day: but he cannot grapple with a heroic poem. Nay, more, whenever he attempts to be very original, he becomes occasionally ridiculous; as in the following:—

"Her hoary locks  
Float like the standard of triumphant time  
Around her sunken cheek."

What are effects  
But blossoming of causes bound by fate  
Each to its secret spring, which he who holds  
The power to wield, should wield?"

What connexion is there here between "the standard of triumphant time" and her "hoary locks?" Or what has "blossoming" to do with causes and effects? We should, however, like to see a volume of short, simple, sacred poems from the pen of Mr. Seymer: he would produce something worth reading in that line; for we believe him to be a very good man. But from another epic, "Good Lord, deliver us."

*The Letters of Horace Walpole, Earl of Orford, &c.* Vol. II. 8vo. London, 1840. Bentley.

Portraits of the Countess of Suffolk, Sir Horace Mann, Richard Bentley (not our living publisher, but the son of the celebrated classic), and Gray the poet, are fitting embellishments of this volume, which contains the Mann correspondence already known and appreciated in a separate publication. There are, however, several new letters to give greater completeness to the general work, and we transcribe the following two, out of three, as specimens to lay before our readers. The first is a bit of literature; the last sarcastic pictures of family felicities, though written facetiously about a child:—

"To the Rev. Joseph Spence.

Arlington Street, June 3, 1751.

"Dear Sir,—I have translated the lines, and send them to you; but the expressive conciseness and beauty of the original, and my disuse of turning verses, made it so difficult, that I beg they may be of no other use than that of shewing you how readily I complied with your request.

Illam, quicquid agit, quoquo vestigia vertit,  
Compositi fursum subaequulorum decor.  
If she but moves or looks, her step, her face,  
By stealth adopt unmediated grace.

There are twenty little literal variations that may be made, and are of no consequence, as *move* or *look*; *air* instead of *step*, and *adopts* instead of *adopt*: I don't know even whether I would not read *steal* and *adopt*, instead of *by stealth adopt*. But none of these changes will make the copy half so pretty as the original. But what signifies that? I am not obliged to be a poet because Tibullus was one; nor is it just now that I have discovered I am not. Adieu!"

"To the Hon. H. S. Conway.

Arlington Street, May 5, 1752.

"I now entirely credit all that my Lord Leicester and his family have said against Lady Mary Coke and her family; and am convinced that it is impossible to marry any thing of the blood of Campbell, without having all her relations in arms to procure a separation immediately. Pray, what have I done? have I come home drunk to my wife within these four first days? or have I sat up gaming all night, and not come home at all to her, after her lady-mother had been persuaded that I was the soberest young nobleman in England, and had the greatest aversion to play? Have I kept my bride awake all night with railing at her father, when all the world had

allowed him to be one of the bravest officers in Europe? In short, in short, I have a mind to take counsel, even of the wisest lawyer now living in matrimonial cases. my Lord Coke . . . . If, like other Norfolk husbands, I must entertain the town with a formal parting, at least it shall be in my own way: my wife shall neither run to Italy after lovers and books,\* nor keep a dormitory in her dressing-room at Whitehall for Westminster schoolboys, your Frederick Campbells, and such like;† nor yet shall she reside at her mother's house, but shall absolutely set out for Strawberry Hill in two or three days, as soon as her room can be well aired; for, to give her her due, I don't think her to blame, but flatter myself she is quite contented with the easy footing we live upon; separate beds, dining in her dressing-room when she is out of humour, and a little toad-eater that I had got for her, and whose pockets and bosom I have never examined, to see if she brought any *billets-doux* from Tommy Lyttelton or any of her fellows. I shall follow her myself in less than a fortnight; and if her family don't give me any more trouble,—why, who knows but at your return you may find your daughter with qualms, and in a sack? If you should happen to want to know any more particulars, she is quite well, has walked in the park every morning, or has the chariot, as she chooses; and, in short, one would think that I or she were much older than we really are, for I grow excessively fond of her."

It may be well to explain that "all this letter refers to Ann Seymour Conway, then three years old, who had been left with her nurse at Mr. Walpole's, during an absence of her father and mother in Ireland.—E."

*The Czar.* By the Author of "Manuella," &c. 3 vols. 12mo. London, 1840. Smallwood.

WHATEVER else may be thought of this historical romance, it must, at any rate, be conceded to the writer, that he has taken up a new ground. Sufficiently read in the olden annals of Russia, he has adopted for his principal personage, if not his hero, the renowned Czar Ivan Vassilivitch, to whom our Elizabeth sent Sir Thomas Randolph on an embassy, accompanied by an accomplished secretary, Master Tuberville, and his suite increased by a still more accomplished and important personage (if we weigh him by the effects of his exploits), in Jocko, a monkey; though we are not informed in what capacity he was appointed to this perilous mission by Burleigh, the Palmerston of that distant day. But, judging from the circumstances, and his memorable acts in support of the negotiation, it may be permitted us to lament that there is not in our own times a monkey attached to every one of our foreign embassies. The Muscovites mistook him for the foul fiend, and, certes, he proved himself a perfect Talleyrand: in short, it is not easy to see how our countrymen would ever have got back without his assistance, or to say what would have been the present state of the Russian empire, had it not been for the influence he exercised in the national affairs at that critical period. An English physician and his lovely daughter also figure on the scene; the rest are Russians, from the czar to his lowest myrmidon—Czarevitchies, Bayars, Boyarinias, patriarchs, priests, Cossacks, Opritchnina officers and soldiers,

\* "Alluding to the wife of his eldest brother, Lord Walpole, Margaret Rolle, who had separated herself from her husband, and resided in Italy.—E."  
† "Lady Towsehead.—E."

and other classes and varieties of the population.

As the czar was quite absolute, and brutally murdered, executed, and destroyed people at and for his pleasure, we do not feel a deep interest in his bloody vagaries; but must speak of the publication as a picture of these barbarians at the remote age chosen by the author, in which light it seems to be reated sufficiently on the best historians and annalists with whom we are acquainted, including Purchas, Olearius, Collins, Guagnino, Clarke, and Karamsin, &c. It would be a waste of patience in us to attempt to trace the amours and the extravagances of the inhuman tyrant whose life is here depicted, and we shall therefore content ourselves with a sample extract, by which the nature of the whole narration may be fairly appreciated:—

"When the monarch entered the banquetting-hall, he appeared to have forgotten all that related to his own degrading conduct, and intent only upon the insult offered to his cherished legion of the Opritchnina, direful was the vengeance he contemplated on the daring outlaws who had provoked his wrath. The banquet proceeded in comparative silence, for which his countenance was the tacit command. No song—no toast enlivened the feast; few dared to speak, until Bomelius, the Dutch physician, facetiously called the monarch's attention to a rumour which related to the English embassy. 'Has my liege heard of the outlandish animal introduced by the English envoy? The first of its species ever beheld in Muscovy.' 'Dost allude to himself?' interrupted Ivan, 'for, of a verity, he hath not been bred in courts, or he would not have answered Muscovy's czar with such daring effrontery.' 'In truth, your majesty is most lenient with these pert islanders,' continued the Dutch Jew, who leaned to his adopted country, then the intriguing rival of England. 'But I would speak of the monkey, so called, which has acquired some notoriety during the short residence of Sir Thomas Randolph. This animal is most hideous, and your loyal people are fully persuaded that the brute is possessed of supernatural powers, and is the representative of his majesty of the regions of darkness.' 'Upon what basis do they establish such a presumption?' inquired the czar, with increasing curiosity. 'Not upon the basis, but the tail of the creature, your majesty. The fact is, the nondescript, although in semblance it doth assimilate most closely to the human form, hath a very questionable appendage—a tail,—your majesty,' further ventured the Jew. 'Then, of a truth, do we opine, with our loyal subjects, that the animal hath the very appurtenances which our holy church ascribes to the evil one.' 'And, moreover, your majesty,' continued Bomelius, 'your lieges affirm that the whole of the embassy are in demoniacal allegiance; and your trusty physician, Wilmington (he insidiously added), has apparently joined in the Satanic conspiracy, for the greatest intimacy exists between him and the ambassador.' The czar looked suspiciously at the Dutchman, as if he was fully conscious of the invidious insinuation. 'There is, moreover,' added Bomelius, 'a stripling whom your majesty may have noticed in the suite of the English; a mere boy; fair-haired and delicate—one George Tuberville. Strange things are told of his practices. 'Tis said, that he is ever stargazing; nay, they do affirm that he is in secret intercourse with evil spirits, and has given out that an eclipse of the sun is to take place on Saint Isaac's day.' 'We are not so credu-

ous, good Bomelius. What! shall it be said that this outlandish witting shall pry into the constellations which light the sky of Russia without our sanction? This is an invasion of our czardom, and doth concern us, Master Bomelius. Let the foreigner interfere with his own luminaries. These are our property; and, without our royal permission, he shall not be suffered to commune with them. But we will question this forward prophet ourselves.' And by his order messengers were immediately despatched to bring the rash astrologer to the presence. Master Tuberville was very much taken by surprise, when, somewhere about midnight, he was intruded upon by an unceremonious order to repair forthwith to the Kremlin. He was at the very moment working an hexameter, the twin rhyme for which had puzzled him more than the line itself; and he most irreverently wished the czar snugly interred in Poet's Corner, when he was thus interrupted. But making a virtue of necessity, he followed his guide, and by the time he had passed the threshold of the palace, had succeeded in the satisfactory completion of his verse; for, though Walker's 'Rhyming Lexicon' had not in that age assisted our poet, he proved himself on this occasion a rhyming walker. The slim person of the secretary was, in the estimation of all true Muscovites, but a sorry recommendation: and though his countenance was intelligent, they looked with contempt upon the slender proportions of his frame, their only standard of manly beauty being quantity, and the bulk of a Falstaff the only criterion of elegance and noble deportment. The secretary, however, whose modesty subdued his just pretensions to almost too narrow limits, even where his talents could be appreciated, and sought with diffidence the smile of approbation, felt all the nobler feelings of man rush to his heart, and flush his cheek, when he encountered the interrogatories of the bloated and ignorant courtiers of a barbarian. 'So!' exclaimed Ivan, as he fixed his suspicious and scrutinising eye upon Tuberville, 'we hear that thou dost deal in necromancy, assortest with the evil one, and with thy sorcery dost inspect the heavenly constellations; and without our sanction dost make observation of that high canopy which spreads over holy Russia. Though 'tis not given us to invade the firmament, yet it pertains to us to restrain the audacious mortal who would seek there for knowledge we have not.' The secretary was lost in amazement at this most singular allegation. 'Now, sir, we are disposed to allow thee to look into heaven, provided thou dost honestly acquaint us with what thou dost observe there. Say! what of this eclipse we hear thou hast prenoted?' 'It is, your majesty, an eclipse of the sun, which on Saint Isaac's day, between the horns of one and three, will be observable in Moscow's city.' 'Now doth this smack of sorcery!' impatiently observed the czar. 'And dost thou maintain that it is in the power of thy science to proclaim such forthcoming event?' The astrologer was puzzled how to elucidate the 'prodromi' of an eclipse to a man whose knowledge of spherical evolutions was evidently very limited. Sighting, therefore, his language to his auditor, he firmly replied—'The science of astrology, your majesty, is one of endless calculation; yet hath it certain evidences, which lead on to accurate inferences; and since we know by past occurrences that such evolutions of our solar system are forerunners of great events to the inhabitants of our earth, so is it desirable we should be prepared, and forestall Heaven's visitations by repentance of our sins.' 'Dost insinuate that we have ought to fear by

thy prognostications?" inquired the czar, with growing interest. "Great czar! I am no prophet. Yet, from certain laws laid down by the learned in this vast science, some general inferences may be drawn." "We hear thee," observed Ivan, as the Englishman paused for permission to proceed. "The quality of the events is known from the nature of the sign in which is the eclipse." "Now what portends the sign to which thou dost allude?" "The moon, 'the ladye of the ascendant,' eclipsing the sun in his own house, doth shew and declare that inferies and designing men shall usurp and eclipse the glory of the great and mighty." The courtiers tittered, as they endeavoured to draw off the attention of the czar, conscious that the prognostications of the astrologer would neither be relished by his majesty, nor prove complimentary to the fealty of his subjects. But Ivan's attention was intently riveted on the speaker. "For thus saith Giuffus," continued Tuberville,—"It threatens destruction to the fruits of the earth; proclaims the invasion of huge armies; announces terrible wars—slaughter of men; predicts the burning of towns, theft, rapine, depopulation; it menaces magistrates, princes, and great kings; it bodes revolution!" The czar turned pale. "Thou sayest, 'tis for Saint Isaac's day. We will ourselves observe the phenomenon, though we like not the results thy prophecy would foretell. But if thou art leagued with the damned, and in thy sorcery dost operate upon our destiny, be sure our wrath shall visit thee. Away! Lead him hence! His presence doth conjure up foul fiends! They dance around me! Away! Master Tuberville availed himself of the earliest hint to depart, prudently surmising that the black looks cast upon him boded as much evil to himself as he had foretold to others of the forthcoming eclipse, and he hastily effected his retreat."

*Bibliotheca Sussexiana. A Descriptive Catalogue, accompanied by Historical and Biographical Notices of the Manuscripts and Printed Books contained in the Library of His Royal Highness the Duke of Sussex, K.G. D.C.L. &c. &c. &c. in Kensington Palace.* By Thomas Joseph Pettigrew, F.R.S. F.L.S. &c. &c. late Librarian to His Royal Highness. Vol. II. London, 1839. Longman and Co.

It is well known to the literary world that Mr. Pettigrew, having undertaken the laborious task of arranging the extensive and valuable, but imperfect and disorganised, library of H.R.H. the Duke of Sussex, at Kensington Palace, of filling up what was wanting, of inquiring into the best editions of all classes of books, and of writing a particular account of the literary treasures accumulated in the royal residence, published in two parts, in the year 1827, the first volume of "*Bibliotheca Sussexiana*." Of the second volume, which we believe has hitherto only been delivered out privately, a copy lies before us. The contents of the two volumes are thus comprehensively described in the autobiography of Mr. Pettigrew, which appears in the 25th or last number of his "*Medical Portrait Gallery*."

"The first part, consisting of 294 pages, gives an account of all the theological manuscripts; many of them are exceedingly curious and valuable. The variety of languages in which they are written rendered the work exceedingly laborious to me, and I spent many an hour even in acquiring a knowledge of the alphabets of some of them. I have described fifty-one Hebrew manuscripts, four of which

are the rolled manuscripts of the Pentateuch, and three of the Phylacteries. Of Greek manuscripts there are twelve; one of which is a New Testament of the 13th century, with curious illustrations. The Latin manuscripts are 148 in number, embracing various copies of the Old and New Testament, some in verse, and a remarkably fine Psalter of the 10th century, together with several fine Books of Offices. There are thirty-four French; nine, Italian; two, Spanish; one, German; eight, Dutch; fourteen, English; one, Irish; four, Arabic; one, Armenian; three, Pali; three, Singhalese; and six, Burman manuscripts. Of all these I have given an account, and added historical and antiquarian notices. I have also, in order to illustrate the circumstances under which they were written, given, as far as my researches would enable me, biographical sketches of the authors or transcribers, including a detailed account of forty-seven persons. The work is enriched with fourteen plates in illustration, and a portrait of His Royal Highness, engraved by William Skelton, from a painting made for me by J. Lonsdale in 1824. The second part of this work forms a large volume of 516 pages, and gives an account of a portion of the printed theological books contained in the library. It extends only to the Latin version of the Holy Scriptures, for I have arranged the different versions according to their antiquity. In this volume will be found an elaborate account of the five larger Polyglotts and all the pieces connected with them; of the five lesser ones and the celebrated Polyglott Pentateuch, printed at Constantinople in 1546. Also of seven Polyglott Psalters, four Polyglott portions of the Old Testament, four Polyglott New Testaments, and two portions of the same. Of the Hebrew Bibles I have described seventy-four editions, and seventeen Hebrew-Samaritan and Hebrew Pentateuchs; also ten portions of the Old Testament in Hebrew, some of which are of the greatest rarity. The Greek Bibles amount to twenty-eight. There are ten portions of the Old Testament in Greek and a Pentateuch. Of the Latin Bibles, a class of extraordinary richness, there are no less than 218 editions, and there are six various portions of the Old Testament in Latin. These are all treated of in the same manner as the manuscripts, and biographical memoirs are given of 125 of the most celebrated editors, printers, &c. facsimiles are also given of the rarest specimens of typography. I dedicated this work to his royal highness, and presented to him a copy, in which the illustrations were depicted in gold and colours, after the manner of the original, forming a most splendid work. Fifty copies were taken off upon large paper, and are deposited in the public libraries, in the collections of crowned heads, and in those of a few of the dignitaries of the church and of the choicest bibliographers. My original intention was to have described the whole of the library in the same manner; but this would have been an endless work. I then determined to confine myself to the theological division. There are, however, so many accounts of portions of this division executed with so much greater ability than I could lay pretension to, that I abandoned this idea, and have only just completed my task by the publication of another volume in 1839, which contains an account of the remaining versions of the Holy Scriptures. This now constitutes, I flatter myself, a tolerably perfect account of the known versions, arranged in a chronological order, and accompanied by historical and biographical notices after the manner of the pre-

ceding part of the work. It contains a variety of information perfectly new upon the subject, and some curious particulars relating to our English versions derived from the manuscripts deposited in the British Museum, the State Paper Office and the Chapter House. This volume gives an account of 1151 works in the following versions:—Coptic, Basmurico-Coptic, Ethiopic, Armenian, Irish, Syriac, Arabic, Anglo-Saxon, Gothic, Georgian, Slavonic, German, French, Italian, Spanish, English, Polish, Swedish, Danish, Bohemian, Dutch, Hungarian, Grison, Wendish, Welsh, Lapponee, Malayan, Portuguese, Manks, American Indian, Finnish, Esthonian, Gaelic, Cingalee, Hindostanee, Bengalee, and Chinese. Of the New Testaments (the Polyglott editions having been described in the previous volume) there are copies in the following languages:—Hebrew, Greek, Latin, Coptic, Armenian, Irish, Syriac, Arabic, Anglo-Saxon, Gothic, Georgian, Slavonic, German, French, Italian, Spanish, English, Swedish, Danish, Dutch, Wendish, Welsh, Basque, Turkish, Lapponee, Malay, Manks, Cingalee, Hindostanee, Bengalee, Telinga, Damulic, Chinese, Calmuck, Amharic, Mohawk, Greenlandish, and Esquimaux. This volume contains 101 biographical notices, and consists of 588 pages."

It may easily be supposed that these 588 pages contain a vast deal of curious and interesting matter. Much of it has never before met the public eye. For instance, there are ten original letters addressed to Lord Cromwell by Miles Coverdale, by whom the first entire translation of the Bible into English was published, and who, as a recompense for this in calculable benefit, was permitted by his grateful countrymen (in pursuance of their too frequent usage on such occasions) to pass his latter days in indigence. In these letters Coverdale shews a warm zeal in the cause of the Reformation, and denounces to the Lord Privy Seal the "preestes that maynteyned the popes authorityte." As more in accordance with our limits, however, we quote a document (also original, and derived from the State Paper Office) which occurs in Mr. Pettigrew's description of "*The Holie Bible, 1568*." This Bible is well known by the title of "*The Bishops' Bible*;" so called because it underwent the revision of eight bishops, as well as of several other learned men. It is a strange, and, if the subject were not of so grave a nature, would be an amusing circumstance, that the first edition of this Bible "is known by the appellation of the Leda Bible, from the story of Leda and Jupiter being engraved on wood, and placed at the commencement of the epistle to the Hebrews!" But to the document to which we have alluded. It consists of a letter from the learned and amiable Archbishop Parker, to whom the direction of the work had been intrusted, to Lord Burleigh, on transmitting to his lordship the first copy of it, for the purpose of its being presented to Queen Elizabeth, and of the letter addressed by the archbishop to her majesty on that occasion.

"Sir,—After my right hartie commendations: I was in purpose to have offred to the Quene's Highnes the first frutes of our labors, in the recognising the Bible; but I feale my health to be such, that as yet I dare not adventure; wherupon for that I wold not have the Quene's Highnes, and Your Honor, to be long delayed, nor the poore Printer, after his great charges, to be longer deferred, I have caused one Booke to be bound as ye see, which I hartely pray you to present favourable to the Quene's Majestie, with your friendlie excuse of

my disability, in not coming myself. I have also written to the Queen's Majesty, the copie wherof I have sent you, the rather to use your opportunity of deliverie, yf your prudence shall not think them tolerable. And because I wold you knewe all, I send you a Note to signifie who first travelled in the diverse Bookes; though, after them, sum other perusing was had; the Letters of their Names be partly affixed in the ende of their Bookes; which I thought a policie to shewe them, to make them more diligent, as answerable for their doings. I have remembered you of such observations, as my first Letters sent to them (by your advise) did signifie. Yt may be, that in so long a worke, thinges may have escaped; which may be lawfull to everie man, 'cum bonâ verâ,' to amend, when they find them. 'Non omnia possumus omnes.' The Printer hath honestly done his diligence: Yf Your Honor wold obtaine of the Queen's Highnes, that this Edition might be licensed, and only commended in publike reading in Churches, to drawe to one Uniformitie, yt weare no greate cost to the most Parishes, and a relief to him, for his great charges sustained. The Psalters might remain in Queres, as they be much multiplied, but wher of their owne accord they wold use this Translation. Sir, I pray Your Honor to be a meane that Jug, only, may have the preferment of this Edition; for yf any other shuld lurch him, to steale from him thes Copie, he weare a great loser in this first doing; and, Sir, without doubt, he hath well deserved to be preferred: a man wold not thinke that he had devoured so much payne, as he hath sustained. Thus I wish Your Honor all Graces Vertue, and Helth, as to myself. From my House at Lamhith, this fifth of October.—Your Honor's loving Friend,

'MATTHUE CARTUAR.'

(Superscribed) 'To the Right Honorable Sir William Cecyll, Knight, Principal Secretary to the Queen's Majesty, and One of Her Privy Counsaill, be it delivered.' (Indorsed) '5. October: 1568. Archbishop of Canterbury to my Master, with the Bible newly sett forth.' Inclosure referred to in the preceding Letter; being Copy of the Letter addressed by Archbishop Parker to Queen Elisabeth, on the first printed Copy of the Translation of the Bible being presented to Her Majesty:—'After my most lowlie submission to Your Majesty, with my hartie reioice of your prosperous progresse and retorne, pleaseth yt Your Highnes to accept in good parte the endeavors and diligence of sum of us, your Chapleins, my Brethren the Bishoppes, with other certain learned men, in this newe Edition of the Bible; I trust by comparisone of divers Translations put forth in your realme, will appeare, as well the workmanhippe of the Printer, as the circumspection of all such as have travelled in the recognition. Amonge divers observations which have bin regarded in this recognition, one was, not to make yt vary much from that Translation which was comonlye used by publike order, except wher eyther the verytie of the Hebrue and Greke moved alteration; or wher the Text was, by some negligence, mutilated from the originall: so that I trust your loving subjectes shall see good cause, in Your Majestie's dayes, to thanke God, and to reioyce to see this His Treasor of His Holy Wordes so set oute, as may be proved (so far forth as mortall man's knowledge can attaine to, or as far forth as God hath hitherto revealed) to be faithfully handeled in the vulgar Tongue; beseeching Your Highnes that yt may have your gracions favor, license, and protec-

tion to be communicated abroad; as well for that in many Churches they want their Bookes and have longe tyme loked for this; as for that in certaine places be publickely used sum Translations, which have not been labored in your Realme; having inspered diverse prejudiciall Notes, which might have ben also well spared. I have byn bolde, in the furniture, with few wordes, to expresse the incomparable valewe of this Treasor; amonge many thinges good, profitable, and bewtiful ye have in possession, yet this only necessarie; wherof so to thinke, and so to beleve, maketh Your Majesty blessed, not only here in this your governaunce, but yt shall advance Your Majesty to attaine, at the last, the Blisse Everlasting; which, after a longe prosperous Raigne over us, Almighty God send yow, as certainly He will, for cherishing that Juell which He loveth best: of which is pronounced, that 'Quomodocunque Cælum et Terra transibunt, Verbum tamen Domini manebit in eternum.' God preserve Your Highnes in all Grace and Felicitie.'

We congratulate Mr. Pettigrew on having so ably terminated his arduous undertaking. If, as he himself acknowledges, he has not quite completed the plan which he originally prescribed to himself, he has mastered its greatest difficulties, and has left a comparatively easy duty for any successor.

#### LORD DUDLEY'S LETTERS.

[Second and concluding notice.]

WE shall now extract some of the passages on general matters which have struck us most forcibly, and with these leave the work to the popularity it is sure to attain:—

*The Press.* "I am persuaded, contributed a very large share towards that monstrous evil—the disproportionate influence of the metropolis over the mind of the people. Every Englishman, from Johnny Groat's House to the Land's End, is certain that he knows the worst—that nothing is concealed—that all the materials for judgment are before him—and that, by reading and comparing the newspapers and journals, he may be just as wise as if he lived within the sound of Bow-bells; but a provincial Frenchman, whose understanding is starved upon a perpetual 'maigre' of 'censured' pamphlets and 'licensed' journals, justly suspects the sources of his information, and defers to the opinions of that aristocracy in political knowledge—the people of Paris, who, surrounding the seat of government, may be supposed to hear what he can never read, and see what he must never be told."

*Rome:—*

"There is not a single wide street, and but one handsome square (Piazza di Savona). Poverty and dirt pursue you to the gates of every monument, ancient or modern, public or private. You never saw any place so nasty nor so beggarly; nor I, except one. Lisbon is a little worse than Rome, and only a little; and it is a disgrace to civilised man. The description of dirt is no very pleasant thing; and therefore, for your sake and for my own, I will not make one. But if you ever come to Rome, you must prepare yourself for having your senses outrageously offended wherever you go. The dignity of a palace,—the sanctity of a church,—the veneration that is due to the remains of ancient greatness, nothing commands the smallest attention to decency or cleanliness. One of our earliest and most natural associations is that of purity with a fountain. Rome has destroyed that in my mind for ever. It contains an incredible num-

ber of beautiful fountains most abundantly supplied with water, but they are all so surrounded by every object that is calculated to excite disgust, as to be absolutely unapproachable. So much dirt implies negligence and sloth. Accordingly every thing is kept in a careless, slovenly way. Not a trace of that neatness and attention to details which gives so much additional beauty to the splendid scene you have beheld from the Place de Louis XV., and which in England is quite universal. In every thing here, and in every body, you see symptoms of that sort of foolish laziness of which among us none but children and very bad servants are guilty. You meet with it on all occasions great and small. When they repair a church, the rubbish remains to spoil the roof and encumber the steps. When they cut a garden-hedge, they leave the clippings to stop up the walks. The effect of this disposition upon the buildings is quite deplorable. Nothing looks its best, and most things look their worst—except St. Peter's; for, to do them justice, they have the grace to keep that in good order. All the rest looks as if it had been thrown into Chancery for the last twenty years."

*The Pope* "is too poor to employ money in building. Indeed, if they don't give him back the March he will hardly have enough to carry on his government, even on its present frugal plan. The mention of his holiness puts me in mind that there are several English Catholics here. Milner represents the violent party, but those of moderate sentiments have prevailed. Milner is not at all in favour, and the Pope has declared plainly and without reserve in favour of the veto. He says the King of Prussia has it, and he sees no reason why the King of England should not have it. I wonder what effect this will have on the red-hot Irish. Will they pretend to be better Papists than the Pope? I know that in France they used to complain 'que le roi n'étoit pas assez royaliste.'"

"I think Madame de Staël is right in saying that the Italians in general have a strong sense of religion, but she has not (so far as I recollect) told us how base a religion it is. Our Protestant divines, who sometimes spoke roughly in the heat of controversy, have hardly exaggerated its demerits. Far from promoting good morals (I speak of the Catholic religion, not as it is explained by Bossuet, but as it is believed by the common people in Italy) it only serves to injure them by lulling the natural feelings of conscience. They believe, indeed, in God and in a future state; but then they also believe quite as firmly that by means of a certain number of crossings, sprinklings, genuflections, ave-marias, and pater-nosters, a whole score of frauds, adulteries, and even assassinations, may be quite wiped out, and they become as fit candidates for heaven as the most just and innocent of men. Whatever is sound and useful in this system is quite overbalanced by that which is absurd and pernicious. The more firmly they believe it, the worse their lives are likely to be. Madame de Staël speaks of it with indulgence, because for some years past she and her friends have grown very favourable to the Roman Catholic religion. Not that they believe it themselves, but that they are inclined to bring it into fashion. As to her, it pleases her imagination; she perhaps fancies that on the whole it is useful, and she is a good deal influenced by those about her. But what their motives are, it is not so easy to make out. What I imagine, however, is this. Infidelity was pretty near worn out. No new reputation

was to be made in that line. The harvest had been reaped by men of admirable wit and learning. Besides, the French Revolution had frightened people, and they began to perceive that atheism was not quite so good a joke. On the whole, then, religion was considered as a more likely step to popularity and fame. But a sober, rational, moderate belief would not answer the purpose. It would surprise and electrify nobody. But the new believers had quite as much vanity to gratify as the old infidels. Somehow or another the world must be astonished, and as in the last century it was done by shewing how little wise men would believe, so in the new school it is accomplished by shewing how much they can believe. Therefore M. Chateaubriand's book is not only Christian, but for the most part eminently Catholic; though I am told he has fallen into some heresies from not quite understanding beforehand what it was that he had undertaken to believe. M. Schlegel, too (I forgot which of the brothers), seeing that no glory was to be gained in the Lutheran church, magnanimously swallowed the whole Romish creed at a single gulp—*cum totius Germaniæ stupore*—which was just what he wanted. But to return to the Italians. Superstition is certainly on the decline here; but it is never succeeded by true religion—always by infidelity.

*Pompeii* "may be considered as a town potted about seventeen hundred years ago for the use of antiquarians in the present century. We that have seen it lately had greatly the advantage over those that preceded us during the last peace. The French government did a prodigious deal towards removing the crust which in this grand specimen of natural cookery is very thick and heavy. At their rate of proceeding the whole town would have been soon disclosed. You may easily suppose how much one's notions of the state of things in the ancient world are helped by a mere glimpse of this singular remain. When, in the course of their labours, the workmen had got to any spot which seemed likely to contain any thing particularly interesting, notice was sent to the court, which generally attended to watch the result. I was present at one of these excavations, and saw several lamps, vases, and other articles, though nothing of great value, dug out. The Queen (i.e. the Marchese Murat) gave me an ancient dish, and a small 'giallo antico' image. I have, of course, preserved them carefully; and if I live to be old, shall very likely shew them to every unfortunate person that comes into my house, without recollecting that my having seen them dug out, which makes them curious in my eyes, don't signify a farthing to any body else. Madame Murat came at ten o'clock in the morning, and stayed six or seven hours looking on with great patience and apparent interest. It was curious even on this occasion, which required, and one would have thought would have commanded, particular care, to see the usual slovenliness of the Italians in full perfection. They worked with infinite awkwardness and precipitation—a parcel of English footmen would have done quite as well. They broke a number of things, that with a very little care might have been got out whole—even my poor little household god has got a most unnecessary chip on the nose."

*Ariosto and Tasso* :—

"There is a very fine 'ottava' which has always been a favourite of mine ever since I first read it (near twenty years ago). I was quite delighted to see it traced by the very pen of Ariosto, and at the same time to learn

something of the history of its formation. It is that (I ought to have mentioned) in which he execrates the invention of fire-arms, which have put an end to those high feats of personal prowess which adorned the ages of chivalry. It harmonises perfectly with what precedes, and with what follows it. No one, I think, would suspect it of being an addition. But from its situation in the MS. it evidently appears to have been a lucky after-thought. It is written crossways on the margin, and, what is remarkable, without a blot. Perhaps it had occurred to him when his papers were not at hand, and he had performed all the corrections in his head. He writes upon a small folio paper, of a slight texture, such as is still in use in Italy. His handwriting is small, neat, and distinct; but not nearly so good as Tasso's, which is bold, correctly formed, and very beautiful. The specimen is of a very different kind from that which is preserved of Ariosto's—not a canto of the 'Jerusalem,' but a letter which it fills one with shame and grief to think that so great a man should ever have had occasion to write. It is dated from prison, and addressed to a friend whom he desires to get five shirts washed for him; 'all of them,' he observes, 'also require mending.' He seems to have been in extreme poverty and distress. There is hardly a more signal disgrace to civilised society than the fate of this great man."

*Observation on Character* :—

"I am glad to hear of —'s promotion. He is a man I feel bound to respect, though I cannot help disliking him. He deserves, no doubt, to be rated very high, and yet it requires all my confidence in your better judgment and knowledge of the particular case, not to think that you rate him too high. I have great difficulty in believing that his pinched, hard, conceited manner, his covert and dissembled, but jealous and vigilant assertion of superiority, even in small things and towards small persons, can belong to a man of the highest order."

*Aphorism* :—

"It is one of the most difficult problems in practical politics to know how far the ruling party ought to go in protecting over-zealous friends. The safest and the honestest side to err on is that of defending them too long."

*Spain and Portugal* :—

"This would be a golden opportunity for effecting an union betwixt Portugal and Spain. It is indispensably necessary for the happiness of both. I understand it has not escaped the attention of the authors of the scenes that have just passed, but that the notion of it is at present unhappily laid aside. It would be a narrow antiquated view of policy that should induce England to oppose it."

*Parliament*; and not unapt in the present day :—

"Opposition complains very much that it is an innovation in our mode of carrying on affairs, for a ministry that is bent upon particular points to retain office. If it is an innovation, I think it is also an improvement. It is quite monstrous that parliament should be obliged to give a blind confidence to the chiefs of one or the other faction, and that it should only have a choice of masters."

Though we have simply strung these pearls together as a sequel to our introductory notice, we have but little to add to our remarks. At Vienna, Lord Dudley takes by no means a flattering view of Austria, or the Austrian government; and there is a period in the correspondence of a painfully melancholy kind, where this accomplished person laboured under

a despondency and depression of spirits, which produced a singularly morbid affection for one living under such happy circumstances. But we will not dwell on this gloomy period; and only conclude with a brief paragraph relative to taxation, which is eminently entitled to attention :—

"Hitherto I am inclined to suspect that we have not gone upon right principles in the reduction of taxes. Should we not do wisely to repeal some of those that most discourage expenditure at home? The sum now annually spent abroad by English people is really a considerable national object. I do not speak of longing bachelors like myself, or of families that go to spend a winter in Italy and return again as soon as it is over; but of the thousands that are settled in dull towns in France and Flanders, purely from motives of economy. Now provisions are almost, if not quite as cheap at home, but the assessed taxes, and (ludicrous as it may appear) I suspect the dearthness of wine, keep them away. Cheap claret, and the hand of the tax-gatherer laid more lightly upon small establishments, would, I am persuaded, bring half of them back again. Most of the English that inhabit foreign countries hate foreigners and foreign habits, and will be most happy to return to their own fire-sides, if they were enabled to do so by a moderate sacrifice of comforts and indulgences."

#### MISCELLANEOUS.

*The Widow Married; a Sequel to the Widow Barnaby.* By Frances Trollope, author of "Michael Armstrong," &c. 3 vols. London, 1840. Colburn.

WE never knew a sequel that did not fall off from the first conception, and "The Widow Barnaby" was too good in her way to admit of being advantageously prolonged through another phase of existence. This novel too, having already appeared, with the exception of the conclusion, in "The New Monthly Magazine," it is the less expedient for us to enter into its details, which are already so widely known. Mrs. O'Donoghue and her daughter Patty are drawn in the author's broad style, under many various aspects and circumstances, some of them entertaining enough; and the sketches of life and society are often characteristic and amusing. The cuts by Burns are clever and appropriate; but we cannot approve of this new fashion of publishing, first in a popular journal, and then, when nearly finished, in a separate form. It is a sort of double dealing in which we can see no sort of propriety or recommendation.

*Vindication of Van Diemen's Land*, &c., by D. Burn. Pp. 79. (London, Southgate.)—An antagonist pamphlet, in which the New Zealand Company folks are severely handled.

*Considerations on the State of the Law regarding Marriages with a Deceased Wife's Sister*, by a Barrister, Middle Temple. Pp. 57. (London, Longman and Co.)—The writer seems to be very desirous to marry his late wife's sister, and gives us plenty of both law and gospel to prove that he would be very right in following his inclinations. We can have no objection.

*Emulation*: an Essay. Pp. 18. (London, Simpkin and Co.)—The essayist espouses an argument which, we fancy, few would attempt to controvert: viz. that well-regulated emulation is an essential ingredient in educating youth.

*The Canadian Naturalist*, &c., by P. H. Gosse. Pp. 379. (London, Van Voorst.)—A charming volume with forty-four engravings, and in the form of conversations, illustrating the natural history of Lower Canada; in which is included a number of very interesting objects.

*A Selection of Poetry for the Use of Schools*: First Series, by Lovell Squire. Pp. 176. (London, Harvey and Darton.)—A second edition bespeaks the merit of these sacred compositions; and we are well pleased to notice some original hymns which do no discredit to the high poetical association in which they appear.

*Prometheus Britannicus*; or, *John Bull and the Rural Police*, by a Rugbeian. Pp. 40. (London, Tilt.)—A clever jeu d'esprit in the shape of a classical parody on the

"Prometheus Bound." John Bull is the Prometheus. Its political tone forbids quotation, but we can assure our readers that it is very humorous, and well worthy of perusal.

*Le Petit Fablier: ou, Esape en Miniature, &c. &c.* (Paris, Gibaud; Edinburgh, Oliver and Boyd; London, Simpkin and Co.; Longman and Co.)—This is a nice little book for the French scholar. The plan is excellent, and the notes and vocabulary, with the words translated and reduced to their elementary principles, a valuable and instructive improvement.

*The Pulpit. Vol. XXXI.* (London, Sherwood and Co.; Simpkin and Marshall.)—This volume, as hitherto, contains a large supply of divinity and pulpit eloquence at a very small expense. The names of Cumming, Melvill, Clayton, Noel, M'Nelle, appear as the principal contributors.

*Family Prayers*, by the late Rev. H. J. Close, M.A. Pp. 72. (London, Cleaver.)—A small body of pious orisons.

*Sermons to the Unconverted: Preached in the Autumn of the Year 1830*, by the Hon. and Rev. Baptist W. Noel, M.A. (London, Sherwood and Co.; Edinburgh, Oliphant and Son.)—Above twenty sermons by this eloquent divine.

## ARTS AND SCIENCES.

### SOCIETY OF ARTS.

ON Tuesday evening, Dr. Truman delivered a lecture 'On the Analogies of the Vegetable and Animal Kingdoms.' Dr. Truman commenced by mentioning that the nature of the vital faculty was not at all understood, and that it was arrested by two classes of causes:—first, those which are external to living beings, as the abstraction of atmospheric air, the operation of certain poisons, and the extremes of heat and cold. Secondly, those which are inherent in the living beings themselves. The Doctor observed, that the extreme cold of the polar regions is destructive to almost all beings possessing vitality; that even the Esquimaux, who are indigenous to those parts of the earth, would be unable to endure it if they were stationary on any particular spot. Being, however, an erratic race, their movements are regulated by the seasons, travelling southward when the winter approaches. As soon as the means of obtaining food are exhausted in one district, they immediately remove to some other part where food can be procured; that our own countrymen who have visited those regions could not have passed several winters there if they had not taken provisions with them. Their stay was always limited to the time their stores lasted, for had they been compelled to remain longer, the cold would, no doubt, have caused their destruction. He remarked that it was very curious that the *protococcus nivalis*, or red snow, as it has been called, is not only able to support such a low temperature, but probably would not flourish in a warmer climate; that the extreme of heat is just as fatal to life as the extreme of cold. In the central parts of Africa, where the average temperature is about 98° of Fahr., added to the almost total absence of moisture, renders vast tracts of country quite unfit for the existence either of animals or vegetables. That the duration of life is pretty accurately known in all beings belonging to the animal kingdom, but if the statements of botanists are true, there are many vegetables with the natural length of whose lives we are unacquainted. If there be, as is stated, specimens of the *Taxodium*, &c., now in an apparently perfect state of health after having existed for between four and five thousand years, the worthy Doctor mentioned, that there appears to be no reason, as far as we can see, that they should not live four or five thousand years longer. This is not the case with animals: the whale is supposed occasionally to reach the age of a thousand years, and therefore attains a greater degree of longevity than any other being, belonging to the animal kingdom; but in no instance does any difficulty exist of ascertaining the average

length of life in this division of animated nature. Some vegetables are remarkable on account of the shortness of their lives. Though a division of living beings into animals and vegetables is extremely useful for the purposes of study, it is very doubtful if such a division exist in nature, at all events, it is impossible to point out where the line of demarcation between them is to be drawn. Chemical analysis cannot always be depended on for distinguishing vegetable from animal substances, since vegetables may be said to exhibit more complex phenomena than many of the inferior animals. These may be grafted on one another, may be propagated by slips, and have a power of reproduction after mutilation very analogous to what is seen in vegetables. Vegetables perform many functions periodically like animals: they have a faculty of being influenced by irritants, as the sensitive plant; though they do not exhibit any thing like the perception of consciousness. They evolve heat. Some are less stationary than many animals. The position of their leaves is altered when abstracted from the influence of light, constituting what Linnæus has called "the sleep of plants." Corals, observed the Doctor, and the actinies, exhibit the forms of vegetable productions, and some vegetables produced flowers similar to the shape of animals. That the number of living beings is so immense, it would be quite impracticable to acquire a knowledge of the phenomena manifested by all; but by making a selection the functions of the human body may be greatly illustrated. Dr. Truman concluded a most interesting illustration, by remarking that there are five varieties of the human race—the Caucasian, the Hyperborean, the Mongolian, the Ethiopian, and the American; and that a lengthened inquiry into the laws regulating the functions of the human body would afford sufficient occupation to the most active-minded person.

### GEOLOGICAL SOCIETY.

THE Anniversary Meeting was held on the 21st of February, when the following fellows were elected the officers and council for the ensuing year:—

*President*.—The Rev. Professor Buckland, D.D.  
*Vice-Presidents*.—G. B. Greenough, Leonard Horner, Esqrs., Sir Woodbine Parish, and the Rev. W. Whewell.

*Secretaries*.—C. Darwin, and W. J. Hamilton, Esqrs.  
*Foreign Secretary*.—H. T. De la Beche, Esq.  
*Treasurer*.—John Taylor, Esq.  
*Council*.—A. Alkin, F. Baily, Esqrs., Viscount Cole, Dr. Fitton, W. Hopkins, R. Hutton, C. Lyell, Esqrs., Professor Miller, R. J. Murchison, E. W. W. Pendarves, Philip Pusey, George Renne, Esqrs., Professor Sedgwick, and Daniel Sharpe, Esq.

After the reading of the reports from the Council, the President announced that the Wollaston medal for 1840 had been awarded by the Council to M. Dumont, for his memoir, map, and sections on the geological constitution of the province of Liège, published in 1832; and one year's proceeds of the Wollaston fund to Mr. James de Carle Sowerby, to facilitate the continuation of his researches in mineral conchology. On presenting the medal to Dr. Fitton, to transmit to M. Dumont, the President said,—

"Dr. Fitton, I am highly gratified that it has become my duty, on the present occasion, to commit to your care, as the representative of our common friend, Professor Dumont, the Wollaston gold medal, which has been awarded to him by the Council of the Geological Society of London, for his 'Memoir on the Geological Constitution of the Province of Liège.' The grounds of this, our tardy recognition, in 1840, of the merits of a work published so long as

eight years ago, are the same that in 1830 prompted the judges appointed by the Academy of Brussels, to select this memoir as most worthy of the prize then proposed by that academy, for the best geological description of the province which has formed the subject of M. Dumont's successful labours. In the work thus doubly crowned, the author has described the mineralogical and zoological characters of the rocks which occupy this district; he has also determined, in minute detail, the relative place in the order of succession, and the superficial extent of each subordinate division of the several formations, and has illustrated the same by an accurately coloured geological map, and by coloured sections, shewing the general disposal of the strata in their original order of superposition; and the extraordinary derangements and disturbances that have subsequently thrown them into a state of almost inextricable confusion. In the execution of this work, M. Dumont has evinced unusual powers of discriminating and accurate observation, combined with a high capacity of reducing the minutiae of local details under the dominion of enlarged and masterly theoretical generalisations. Advancing at the early age of twenty-one to a task of gigantic labour in a region where the unheard-of disturbances, and almost incredible complexity of its component strata, had baffled the sagacity of the most experienced geologists, this extraordinary youth at once withdraws the veil of confusion which had hitherto disguised the stratigraphical arrangement of his native province, and, as it were, by an intuitive touch, reduces to order the entangled and almost incredible phenomena of dislocation, contortion, and inversion, which had perplexed his predecessors in the same field of observation. In addition to the scientific value of M. Dumont's exact and laborious researches, in illustrating a high and difficult problem in positive geology, his work assumes a place of great statistical and commercial importance, as describing the structure and contents of a rich and productive carboniferous district, containing eighty-three beds of valuable coal; and its practical utility has been fully shewn by the fact of a second edition having been required to supply the demands of the landed proprietors, and persons practically interested in the operations and products of the coal-mines." After alluding to the English Society having taken time to investigate the subject before it followed the example of that of Brussels, the speaker continued:—"It is for this great work, then, as in 1832 it issued from the hands of a young and then unknown individual, and apart from any more recent attempts to identify the Belgian formations with those of England, that our Society has awarded to M. André Hubert Dumont their gold Wollaston medal for the present year, in testimony of their admiration of the almost precocious talents displayed by him, and of their sense of his worthiness to fill the distinguished scientific position to which he is now advanced, as Professor of Mineralogy and Geology in the College of Liège."—Dr. Fitton, on receiving the medal from the hands of the President, and at the request of M. Dumont, expressed the deep feeling that gentleman entertained of the honour conferred on him, and his hopes that he might soon be enabled to come into England, for the purpose of enlarging his personal acquaintance with the members of the Society, and of being enabled to perfect by their knowledge and example the comparison of the ancient strata of Belgium and the adjacent districts with those

of our country. On presenting the year's proceeds awarded to Mr. James de Carle Sowerby, Dr. Buckland also congratulated him on this award, in order to facilitate the continuation of his researches in mineral conchology. "The services are great," said the President, "which have been rendered to geology by the extremely useful and well-timed work on fossil shells, which was many years ago begun by your excellent father, and continued by him to the end of his life, and has been since conducted by yourself; and the association of his name with that of Dr. Wollaston recalls to my mind, as it must to the minds of most of my hearers, pleasing and grateful recollections of the benefits which, during their lives, they both conferred on this Society, and which their works will have extended to all our contemporaries and successors in this department of scientific inquiry. It was your father's peculiar merit to be one of those accurate and enthusiastic observers of nature, who have in modern times contributed so much to remove from science the rugged and austere aspect under which it used to be presented; and who, by facilitating to every one the means of advancing pleasantly in its pursuit, have, in an essential manner, promoted and given popularity to the sciences of botany and conchology. It is to mineral conchology which he so especially promoted, that we who are occupied with the investigation of the structure of the earth have in modern times been mainly indebted for evidences which have led to the establishment of many of the most important stratigraphical distributions, that have arisen from discoveries as to the successive changes in animated nature, made known to us by the study of fossil shells. It was on this foundation that Cuvier and Brongniart established their important divisions of the marine and fresh-water strata of the tertiary formations, since more minutely distributed by Mr. Lyell, into the *Eocene*, *Pliocene*, and *Miocene* series, according to their relative numbers of extinct and recent species of fossil shells. It was on a similar foundation that Smith reared his identification of the secondary formations of England by their fossil remains. It is on the same basis of conchological evidence that Mr. Murchison has founded his fourfold subdivisions of the Silurian portion of the transition rocks; and it is chiefly to the illumination which this branch of paleontology has shed upon the changes that took place on the surface of the earth, whilst its strata were in process of formation, that we owe the rapid advance in geological knowledge which has been made since the commencement of the present century. To this rapid progress, arising from the introduction of the evidences of mineral conchology, your publications and those of your family have largely contributed. You have further co-operated materially in advancing our inquiries by your personal assistance, at all times cheerfully and liberally rendered, to all your fellow-labourers in the same fields of scientific research who stood in need of your aid for the elucidation of minute distinctions in the characters of fossil organic remains, which have at this time become so important an element in geology. The volumes of the 'Transactions' of this Society, and other publications by many of its members, including myself, bear further testimony to the value of your labours in illustrating our works with drawings and engravings of fossil shells and plants, expressing their characters with a degree of accuracy and truth which no pencil or burine but those of a scientific artist could possibly accomplish; and I am

sure I give utterance to the feelings of many of our fellow-labourers now around me when I thus publicly acknowledge the services you have rendered, both to ourselves and to the science we cultivate, and testify our satisfaction at the present public recognition of your valuable services by the Geological Society of London." Mr. Sowerby then expressed himself in the following terms,—

"Sir,—I hardly know what to say, so deeply do I feel the unexpected and kind award bestowed upon me by this Society, but I must assure you that I am extremely grateful for the honour done me. When, sir, you spoke of my father, you excited feelings most dear to me; and I have long felt that I have experienced more consideration than I have deserved, in consequence of the esteem that has ever been attached to his memory. But I must have been a most ungrateful son had I not, after his persevering and kind instructions, done something for the advancement of natural history. What little I have performed, especially for members of this Society, has been for the love of science, and I feel far more than amply rewarded by the honourable present I have just received at your hands. You have stated, sir, that you take a pleasure in associating the name of Wollaston with that of Sowerby; I shall never forget the kindness and patience with which Dr. Wollaston communicated information when the reflecting goniometer was first completed by him. He spent several hours one morning with me in his study measuring the cleavages of various minerals related to Hornblende and Augite, which I took to him for his opinion; and at another time he indulged me with an equally long lesson on the chemical examination of minute portions of minerals. Little did I think at that time, that I should ever share encouragement continued by his bounty after his departure from this world, but I have lived to feel that his benevolence lives beyond the grave. Sir, I receive this award as a trust reposed in me, and hope that I shall not be found wanting in carrying out the object the Council has in view. I beg sincerely to thank the Society for the confidence placed in me." During the morning meeting, Dr. Buckland read a portion of his address, including notices of the following deceased fellows and foreign members: Mr. Davies Gilbert, Captain Alexander Gerrard, Sir John St. Aubyn, Colonel Silvertop, Mr. Hutton, Professor Esmark, M. Gimbernat, and Professor Mohs; also an eulogy on the late Mr. William Smith, the father of English geology; and in the evening he read the remainder of the address.

#### ROYAL GEOGRAPHICAL SOCIETY.

MARCH 9.—Mr. Greenough, President, in the chair, read a copy of the congratulatory Address he had presented to her Majesty in the name of the Society at the last levee. Extracts from the following papers were read:—1. From Governor Gawler, dated Adelaide, 1st September, with a Chart of the Outlet of the Lake Alexandrina into Encounter Bay, on the south coast of Australia; whence it appears that small craft drawing about three feet water may ply from the elbow of the Murray across the lake, and up to the great south bend. Mr. Eyre had left Port Lincoln by land for Streaky Bay, 150 miles to the north-westward, where the governor had directed a small vessel to meet him, that part of the coast being hitherto unexamined.—2. 'Notes on a Journey across Mexico, from Vera Cruz to Mazatlan, on the Pacific; to the Sandwich Islands; to China; and round the Globe, in 1838-9,' by Mr.

Isidore Löwenstern, of Vienna. After a residence of some time in the city of Mexico, during which Mr. Löwenstern visited the pyramids of Cholula, Teotihuacan, Xochicalco, &c., the mines of Real del Monte, and the neighbouring Obsidian mines, where are the remarkable rocks known by the name of *Péñas Cargadas*, he quitted the capital on the 24th July, 1838, and travelled by the usual route through Querétaro, Guadalajara, and Tepic, to Mazatlan. At Remedios, about seven miles to the westward of Mexico, Mr. Löwenstern discovered a mound resembling a pyramid, divided into stories, which apparently had been faced with stone: on its summit were the ruins of a castle. Querétaro, 100 miles north-west of Mexico, and 6070 above the sea, is a picturesque town of 20,000 inhabitants, surrounded by gardens, in which the lofty cypress and gigantic organ-cactus are conspicuous: here is a large aqueduct, and a plentiful supply of water. Celaya, a town of 10,000 inhabitants, twenty miles further west, is in the midst of the most fertile and most populous district in Mexico. Its high cultivation is chiefly owing to the enlightened views of the statesman Don Lucas Alaman. At Guanajuato, 6870 feet above the sea, General Cortazar has recently established a mining institution. Near Tepetitlan, eighty miles further west, Mr. Löwenstern discovered another pyramid, resembling in construction that of Xochicalco, of three stories, with a circular mound on its summit: it is composed of earth, and has apparently been cased with stone. This monument is of the greater interest, as being situated in a part of the country in which no such remains had hitherto been found, and probably on the line of emigration of the Aztecs from California to Mexico. Guadalajara, forty miles further west, has a population of 70,000, and, after the capital, is the largest and most thriving town in Mexico; it can boast of a respectable Italian Opera. From this place the country becomes wild and barren, as you approach the Plan de Barrancas, near which the highest summit of the mountain is passed, at an elevation, probably, of 7500 feet, and from this point the country rapidly descends towards the *Tierras Calientes*. Tepic, a town of 10,000 inhabitants, is still 2900 feet above the Pacific at San Blas, from which it is distant about thirty miles; the road hence assumes a more northerly direction, and, thirty miles beyond, crosses the great river of this part of the country, the Rio Grande, or Tololotlan, which has its source near the Nevado de Toluca, about twenty miles south-west of the capital, and, after a course of upwards of 450 miles in a general W.N.W. direction, falls into the Pacific at the port of San Blas; hence by a road which leads along at a distance of twenty miles from the coast, and passing the towns of Acaponeta and Escuinapa, the traveller reaches the port of Mazatlan, which is the most tolerable roadstead on this part of the coast. After a residence of eleven months in Mexico, Mr. Löwenstern embarked for the Sandwich Islands, where he remained two months, during which time he ascended the volcano of Mowna Roa (13,200 feet), in Hawaii. He confirms Mr. Douglas's account of this remarkable mountain in every point, except the circumference of the crater; which Mr. Löwenstern estimates at two miles, and which Douglas considered to be six miles and a quarter. The traveller also visited Kirau-ea, which he agrees with Douglas in describing as the most remarkable volcano in the world. From the Sandwich Islands, Mr. Löwenstern visited

Canton and the island of Celebes, quitted the Asiatic Archipelago by the Straits of Sapi, and rounding the Cape of Good Hope, reached Europe in November 1839. Mr. Löwenstern, who was present, gave an account of a large collection of Mexican antiquities, some curious vases in terra cotta, drawings, specimens of the mines, &c., which were exhibited to the meeting.—3. 'Note on a Journey from Zacatecas to Camotlan, with a Sketch of the Physical Geography of Mexico,' by Major Charters, Royal Artillery. *Veta grande*, or the great metalliferous vein, the point of departure, lies about four miles north of Zacatecas, on a group of isolated mountains, about six miles in length, rising from a wide plain, and nearly midway between the Atlantic and Pacific, which in the parallel of 23° is about 400 miles across. Its position is in 22° 50' north, 102° 27' west, and it lies 8550 feet above the sea; magnetic variation, 8° 7' E. in 1831. These mountains are arid, stony, and barren, their surface scarcely affords a symptom of vegetation, but their mineral wealth is great; in this respect, perhaps, next to Guanaxuato. The highest mountain in the group, called the Angel, reaches 8950 feet. "It is a striking feature in the physical geography of this part of Mexico," says Major Charters, "the existence of the number of mountain ranges, whose directions nearly coincide with the meridian line. Between the town of Aguas Calientes and the valley of Camotlan, a distance of about 120 miles, I have traversed five of these parallel ranges; the mountains forming them are generally about 2000 feet above the intermediate valleys, and on some of their slopes useful timber is found in abundance. All the streams which run through these valleys empty themselves into the Rio Grande, which receives the drainage of a great extent of mountainous country to the northward of it. The size of this river, which, after receiving all these tributaries, is certainly not greater than the Tweed at Kelso, is a proof of the small quantity of water furnished by these regions. It is remarkable that such a lofty range as the western boundary of the Bolaños valley, the western slopes of which are covered with immense forests, where the atmospheric water falls abundantly during the months from May to October, furnishes few, if any perennial streams; so that all superficial vegetation disappears during the dry season. Towards the end of that period even the river of Bolaños ceases to flow in a continuous course, and is seen in pools, separated from each other by a greater or less space of a superficially dry bed. Rapid evaporation, arising from diminution of atmospheric pressure, is doubtless the cause of this remarkable difference between Mexico and most other countries; the average height of the great table land may be taken at 7500 feet, and the numerous mountain ranges throw their summits two or three thousand feet above this level: but some of them, with the exception of Popocatepetl (7773 feet), Orizaba (17,370 feet), Nevado de Toluca (15,263 feet), Istucchiuati, reach the limit of perpetual snow, but they are exoteric mountains and do not influence the question. Mexico is, therefore, deprived of this resource, which, in the more southern regions of the same continent, nourishes the great rivers that water it. A vast surface is exposed during seven months of the year to the effect of rapid evaporation, increased by a clear atmosphere and almost unvarying sunshine; the moisture that had been absorbed during the rainy season is exhausted, and the atmosphere becomes so deficient of vapour, that I have

frequently found it very difficult to condense it on the black bulb of Daniel's hygrometer, and more than once have failed altogether in doing so. In these elevated regions there is little perceptible perspiration in the human body, for the rapid evaporation carries it off as soon as formed, and when forced by violent exercise it remains but for a moment." After describing his route by the Bolaños and another parallel valley, Major C. says of the latter, which is an extended plain, and not like the former, wild and rugged—"It is inhabited by the Guichole Indians, a harmless and pacific race, who live in the caverns and sheltered places of the mountains, and cultivate maize, and have little or no communication with the neighbouring Creoles. They are armed with bows and arrows, with the use of which they are very dexterous. They are Christians, and are visited by the curate of Bolaños twice a-year." Major Charters' paper was illustrated by a section of Mexico, from San Blas on the Pacific to Tampico on the Atlantic, geologically coloured, by Mr. Burkart, late chief miner in the Bolaños mining establishment, all the heights in which were observed by two good mountain barometers of Newman's construction; and also by a map on a large scale, shewing the routes of the travellers across the country. An Aztec map, seven yards long, was also exhibited, being a copy of that preserved in the Museum at Mexico, and said to show in hieroglyphics the route of the Aztecs from Behring's Straits, at the north-west extreme of America, to the city of Mexico. Among the books on the table was an elementary work on Geography (a book much wanted), by Mr. Augustus Mitchell, of Philadelphia, which seems well illustrated by woodcuts of the most remarkable places in the globe.

#### ZOOLOGICAL SOCIETY.

USUAL monthly meeting. Sir G. Clerk in the chair.—Fellows were elected. Nearly 4000 persons visited the gardens and museum in February. Balance carried to account, March 1st, 1401*l*. The mortality amongst the Society's monkeys is to be regretted; of forty, thirty-six have died within the last two or three weeks: the remaining four, if alive, are complaining! A collection of prepared specimens of birds, from Erzerum, were lately presented to the museum. One of them, the *Yunx Torquilla* of Linnæus, is thus described:—"Shot on a tombstone; habit, solitary!"

#### MEDICAL SOCIETY.

THE Sixty-seventh Anniversary of this parent of all our medical societies was observed at the London Coffee House on Monday last. The oration was pronounced by Dr. J. R. Bennett; and embracing subjects of general interest to the profession, which he treated with great ability: it was much applauded. The members then dined together, under the presidency of Dr. Kingdom (*pro* Dr. Stewart, who is in Italy), supported on his right by the president elect, Dr. Clutterbuck, and on his left by Dr. Shearman, who has (it was stated) been of the Society for more than fifty years. The day went off with much social harmony, and in the course of the toasts the healths were drunk of the two medallists, Dr. Thomson and Mr. Oswald. Both these gentlemen acknowledged the honour in appropriate speeches, and the evening closed with the convivial, though moderate feeling, that neither teetotalism nor homeopathic doses of wine were patronised by the Medical Society of London. In a graver point of view, the continual intercourse kept

up by the members of this Institution at their weekly meetings in Bolt Court, the statement of difficult cases as they occur, and the communications of great practice and experience, are of infinite value to the sick and the afflicted. Nothing can tend more directly to improve the profession on which so much of human happiness depends.

#### ROYAL BOTANIC SOCIETY.

THE first meeting of the Fellows of the Royal Botanic Society of London for this season was held on Tuesday evening, at their apartments, 49 Pall Mall; the Marquess of Northampton, vice-president, in the chair.—After the preliminary business, a ballot for the election of fellows took place, when 189 noblemen, ladies, and gentlemen, were added to the list. At the next meeting the plans for laying out the gardens in Regent's Park (for which there is a great competition) will be exhibited to the fellows and their friends. The designs are to be sent in on Saturday, April 4th, and the exhibition of them will take place on the Wednesday following.

#### PARIS LETTER.

Academy of Sciences, March 10, 1840.

SITTING of 2d March.—M. Stanislas Julien, the eminent Chinese scholar, laid on the table a specimen of a stuff made in China from the filamentous particles of the *Urtica nives*: this stuff was called in Chinese, he stated, by the name of *A-pou*, or summer-cloth; and in the southern parts of that empire was valued as much as silk, from its being so light and cool. The quality of the stuff now produced was equal to that of fine cambric. M. Adolphe Brongniart stated that some seeds of this plant had been sent to him, and had been planted at the Jardin des Plantes, but they had produced only a species of urtica long known in the hot-houses of that establishment, where it had often flowered, but had never produced seed.

M. Arago communicated to the Academy an improvement on the apparatus of the Daguerreotype, by which the inconvenience of carrying a large quantity of quicksilver was avoided. It consisted in using a small portion of an amalgam of silver and mercury placed on a small plate, which, for bringing out the photogenic image from the iodised plate after it has passed through the camera obscura, had only to be subjected to the action of a spirit-lamp in order to be dissolved, and to produce the same effect as the vapourisation of pure mercury. The name of the inventor of this improvement, curiously enough, happened to be *Soleil*, the well-known optician.—M. Lassaigue put in a claim to priority of invention in the preparation of the photogenic paper used by M. Bayard; and shewed that, on April 8, 1839, he had communicated to the Academy photogenic drawings produced by exactly the same kind of prepared paper.

Count Demidoff addressed to the Academy a note on the improved method of Professor Jacobi, of St. Petersburg, for obtaining metallic casts of medals, &c., by the voltaic decomposition of mixtures holding metallic substances in solution. Several beautiful specimens of the produce of this invention were shewn to the Academy.

A communication was made from the office of the Minister of Commerce, that government had decided on establishing an observatory at Havre, and furnishing it with the best instruments for the use of navigators.

A letter was read from M. de Mirbel, stating that the pseudonymous work on plants which used to be attributed to Aristotle, but which some savans had supposed to be of as recent date as the twelfth century, was, in reality, written by Nicolaus Damascenus in the time of Augustus.

M. Jobard, of Brussels, communicated a curious fact relative to the currents of water in an Artesian well at Cossingen. These currents, having an upward motion, caused, as it was supposed, by the increased temperature of the water at the bottom of the bore, were found to have several times unscrewed the boring instrument; and on a screw with the thread turned in the inverse direction being used, the same effect was not produced: hence it was inferred, that an helico-spiral motion was the prevalent one of the currents in question. M. Jobard, in generalising this fact, observed, that it might be accounted for by the opposition of some obstacle in the bore which would generate an helico-spiral motion in the ascending column of water.—A letter was read from M. Demidoff, containing a table of meteorological observations made at Nigne Tagulak, in the Oural Mountains, during November 1839. The lowest point to which the thermometer fell was 31° below zero of Réaumur, on the 22d November, at 2 A.M.

A memoir was read on a machine invented by M. Gervais, for making excavations in railroad works. It was represented as capable of attacking a space of soil  $7\frac{1}{2}$  feet in width, by an ingenious system of rotatory pick-axes, communicating with rakes behind, and of thus excavating about the third of a yard per minute in vegetable soil. It had not yet been applied to very hard soils.

M. Canchy read a memoir on various questions of analytical mechanics; and M. Combes one on hydraulic wheels.

M. Augustin Thierry has just published a new work, entitled "Récits des Temps Mérovingiens," preceded by some general remarks on the history of France, 2 vols. 8vo. We have not had time to peruse this book, but any thing coming from the experienced pen of such an erudite historian and eloquent narrator cannot fail to be interesting. This work is admitted at the Institute to compete for the Gobert prize. M. Mary-Lafon has sent out to the world his "Tableau, Historique et Littéraire, du 12<sup>me</sup> Siècle," in which he treats at great length of the literature of Provence and Aquitaine at that period. His researches into the literary history of Bertrand de Born forms one of the best parts of the work.

The horticulturists have received a contribution this last week from the Paris press, in the shape of a "Traité, Spécial et Didactique, du Dahlia." It is a small volume, and just the thing for dahlia-fanciers.

We see that among other literary and antiquarian prizes proposed this year by the Académie d'Arras, is one on the Roman roads in the Pae de Calais: any British tourist, who would like to hunt up such remains of antiquity, may thus gain immortal honour during a summer's ramble. Another prize proposed by the same Academy is for the easy topic of "The Reconciliation of the Agricultural and Manufacturing Interests." We shall certainly have the squaring of the circle proposed next year.

A most lamentable fire occurred in the library of the Collegio Romano at Rome, a short time since, in which 370 MSS. were destroyed; of which there were twenty-seven Arabic, forty-three Persian, and nine Armenian, besides a large collection of Hindoo and Chinese dramas,

all inedited, and of which no copies exist in Europe! The number of printed volumes lost has not been ascertained, but about 1500 volumes of the earliest times of printing are gone, including the whole collection of the great philologist Muretus, most of them enriched with his marginal notes.

M. Paul Lacroix's (Bibliophile Jacob's) collection of charters, documents, &c., relating to the history of France, in 180 volumes folio, which he had been many years forming, has just been sold at Paris to a Belgian gentleman of Liège, and are lost to France.

The celebrated astronomer Olbers died at Bremen on the 2d inst., aged 82.

#### LITERARY AND LEARNED. UNIVERSITY INTELLIGENCE.

OXFORD, March 5.—The following degrees were conferred:—

*Master of Arts*.—Rev. H. P. Foulkes, Balliol College.  
*Bachelors of Arts*.—Hon. C. Somers-Cocks, G. S. H. Vyse, Christ Church; C. Whitaker, Brasenose College.

CAMBRIDGE, March 4.—The following degrees were conferred:—

*Master of Arts*.—T. C. Dawes, Corpus Christi College.  
*Bachelor in the Civil Law*.—H. White, Trinity College.

*Bachelors of Arts*.—C. R. Burnet, W. Evans, F. R. Mills, J. M. Neale, C. L. Rose, Trinity College; J. L. Breachley, C. Campbell, J. W. Hepworth, T. W. Hulkes, G. H. Ray, H. C. Sellar, R. C. Willy, St. John's College; G. G. Guyon, St. Peter's College; A. Lambert, Pembroke College; H. A. Hotchkiss, Clare Hall; H. Weightman, Trinity Hall; J. L. Simson, E. S. Stanley, Jesus College; C. W. S. Lowndes, J. Spence, Christ's College; W. Almut, Catherine Hall, B. J. Armstrong, Caius College; J. B. Reynardson, J. Young, Corpus Christi College.

Dr. Newcome's Prize, at St. John's College, for the best proficient in Moral Philosophy among the commencing Bachelors of Arts, whose names have appeared on the Tripos, was adjudged on Wednesday last to Dr. Calder. The subjects of examination were Paley's Moral Philosophy, Whewell's Foundation of Morals, and Neville's Defence of Paley against the objections of Whewell and Sedgwick.

#### ROYAL SOCIETY.

THE Marquess of Northampton in the chair.—Read, a second note of Sir John Herschel on his paper of last week touching Photography.—Read, also, a communication by the Rev. Baden Powell "On Light." The object of this paper is more fully to develop certain principles laid down by the author in a memoir by him, which was read before a section of the British Association in 1839.

#### ROYAL SOCIETY OF LITERATURE.

ON Thursday, Colonel Leake in the chair, the Chevalier Brönstedt made his promised remarks "On the Western Pediment of the Parthenon:" previous to which, Mr. Hamilton read the following extract of an interesting letter to Dr. Bostock (a member of the Council), from his son, Mr. J. A. Bostock, at Athens, and bearing upon the subject:—

"Athens, June 1836.

"The Parthenon was built upon the foundations of the first temple, which was destroyed by the Persians; and these foundations are still seen at the western front, where they form part of the oblong platform on which the present building stands. This platform is not flat, but is arched in both directions, the four corners being considerably lower than the centre. The columns are all thirty-four feet high, and therefore the capitals and the entablature have all the same arch. It is not seen at a distance, but is distinctly visible by placing the eye at one corner of the cornice, or any other of the lines, when it is seen to deviate from the straight ray of light. The axes of the columns also are not perpendicular but inclined towards the centre, or rather to the line of the highest ridge

of the roof. This inclination is produced by the lowest stone of each column being an inch and a half higher on one side (the external) than on the other. Both these peculiarities add much to the strength and solidity of the whole fabric, and counteract the tendency of the columns to be forced outwards by the weight of the roof. We observed the same thing in the temple of Theseus, which is nearly in its original state. There appears to be no doubt that the whole building was coloured; the prevailing tint was red; the triglyphs and guttae were azure; fragments, proving this to have been the case, are now in the museum at Athens; and I found in a fold of drapery, in one of the only two figures in the western pediment, which still remain in their places, a large piece of blue."

M. Brönstedt began his very interesting discourse by observing, that the figures were smaller on the Western than on the Eastern Pediment; and he incidentally gave his opinion (an opinion held also by Mr. Bostock) that the famous temple at Egina was a Temple of Pallas, and not, as has been imagined, of Jupiter. With regard to the immediate matter under discussion, fewer fragments of the Western than of the Eastern Pediment had descended to our times, and drawings of only six could be exhibited. In some measure the loss was supplied by the drawings of Carré, who copied the work as it appeared in 1673 or 4. It then consisted of eighteen figures and two horses; the original having been complete in twenty figures and four horses. Fourteen years after the time of Carré, the Parthenon (this portion in particular) was nearly destroyed by an explosion of gunpowder, during the siege of Athens and the war between the Venetians and Turks. It was worthy of remark, that among the troops of the former were a considerable number from the north of Europe, and by these many of the fragments scattered by this accident were carried away. Among others, Koningsmark, the general who commanded the Venetian cavalry, preserved two heads; and they were discovered by the Chevalier in the Museum at Copenhagen, so recently as the year 1828. He accounted for their having remained so long unknown, by the death of M. Hartmann, by whom they had been transmitted, without any statement of what they were or to what structure they belonged. [Engravings of these heads, full of expression, were shewn, and no doubt could be felt of their authenticity.] The Chevalier then referred to a passage in "Apollodorus," who describes the Phidian sculpture on the pediment as representing the strife between Minerva and Neptune for the divinity of Attica; and the author says that the figures were stated to consist of the River Gods and Local Heroes of the place; though he was inclined to the opinion that they might be the twelve great Olympian Gods. To the former hypothesis he confidently adhered, and thought that every portion of the design proved that the question was decided, in conformity with the most ancient mythology, by personages of local worship, such as the people of Athens deified two centuries before our era, whereas the Olympian Gods had only grown into faith and superiority during the six or eight centuries that succeeded. Before the Alexandrine time, when they acquired this supremacy, Cecrops, Erechtheus, and other local divinities, were invoked at Athens, and the same occurred in other parts of Greece.

The Chevalier did not allude to it; but the number of the figures, *twelve*, seems greatly opposed to this idea.—Ed. L. G.

An example of this was found at Corinth, where, in the dispute between Apollo and Neptune, *Briareus*, a local deity like Cecrops at Athens, and not an Olympic God, decided the question that Aëro-Corinth should belong to Apollo and the low lands to Neptune. Other instances of the same kind might also be quoted. The Chevalier now came to the figures on the pediment; and from many cogent reasons and references, pointed out that the centre was occupied by Minerva and Neptune, with the olive-tree between them, and the latter as if moving to depart. On the side of Minerva the next figures were the Victory without wings (for Minerva, like her father Jupiter, could never be vanquished) guiding her chariot, and attended by her mythological son. On the side of Amphitrite, his wife, and their only daughter, occupied similar places. Towards the angle of Minerva, Cecrops and his wife,\* and family of three daughters and one youthful son, were represented. Towards the other angle, Erechtheus and his family appeared; but not being so numerous as the Cecropian group, they were balanced by the introduction of two figures, the first the Mythos of the Land of Attica, and the other of the Sea. In the lap of the former, two children appeared; and from the lap of the latter Aphrodite, the infant Venus was rising. Each angle was finished by River Gods and Fountain Deities belonging to the soil, and the Chevalier repudiated the notion that those on the right were Latona, &c.; for Latona was much later in the Greek mythology, and could not be present at the first exploit of the great Attic divinity Minerva.

We are sorry we can only give this hasty outline of a very delightful and instructive lecture, in which a volume of classical and antiquarian research was embodied.

#### SOCIETY OF ANTIQUARIES.

MR. HUDSON GURNEY, V.P. in the chair.—The Rev. H. Christmas exhibited a locket containing portraits of Cromwell and Hampden.—A third letter was read from Mr. G. Goodwin, jun., on the Ecclesiastical Architecture of Lower Normandy, particularly the Church of St. Stephen at Caen, founded by William the Conqueror, and where he was buried.—Mr. H. Smith communicated a description of the Galleries of Durham Cathedral, and the Altar of our Lady of Pity, five drawings of which were exhibited at the last meeting.†

#### THE LITERARY FUND.

AT the anniversary on Wednesday there was a general re-election of the president, vice-presidents, and other officers of this excellent Institution; and a manifest improvement on their efficiency as a body was made by reviving two offices which had fallen into desuetude, viz. the offices of honorary solicitor and honorary physician. The trouble of the former was generously undertaken by William Tooke, Esq. (already one of the treasurers of the Fund); and for the latter, Dr. Fraser, now returning from Rome, also offered his services in the most liberal manner. When it is remembered how often medical aid may be administered to the

\* Cecrops and his wife are the only figures remaining, being preserved by the incumbent fall of the heavy marble cornice above them.

† Two cases, with glazed fronts, have been placed up in the meeting-room for the reception of relics of antiquity. We hail with pleasure this small commencement of a Museum of Antiquities, the want of which had, we think, long been a disgrace to the Society; but such a desirable addition can never be properly attained until the Society have another apartment, in addition to those they now occupy.

applicants, and be far more valuable than any pecuniary aid which could be given them, the value and importance of this arrangement can hardly be too highly estimated.

#### LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday*.—Statistical (Anniversary), 3 P.M.; British Architects, 8 P.M.; United Service Institution, 9 P.M.; Medical, 8 P.M.  
*Tuesday*.—Linnean, 8 P.M.; Horticultural, 3 P.M.; Civil Engineers, 8 P.M.; Electrical, 8 P.M.  
*Wednesday*.—Society of Arts, 7½ P.M.  
*Thursday*.—Royal, 8½ P.M.; Antiquaries, 8 P.M.  
*Friday*.—Royal Institution, 8½ P.M.; Botanical, 8 P.M.  
*Saturday*.—Asiatic, 2 P.M.; Westminster Medical, 8 P.M.; Physical, 8 P.M.

#### FINE ARTS.

##### MR. HAYTER'S PICTURE OF THE CORONATION.

DURING the whole of the present week Messrs. Hodgson and Graves's gallery, in Pall Mall, has been crowded by visitors of rank, beauty, loyalty, and taste, to see the picture of "The Coronation of Her Majesty, Queen Victoria," painted by George Hayter, Esq. her majesty's historical and portrait painter. Nor are we surprised at the eagerness thus manifested. The subject is deeply interesting, and admirably suited to graphic representation; and Mr. Hayter has produced from it a work that must greatly add to the already well-deserved reputation of the painter of "The Trial of Lord William Russell."

The point of time selected by Mr. Hayter is that at which her majesty, seated in St. Edward's chair, fronting the altar, and having been invested with the Dalmatic Robe, and having received the Royal Sceptre and the Rod of Equity and Mercy, and, finally, having been actually crowned by the Archbishop of Canterbury, is attending to the most reverend prelate's exhortation from the steps of the altar, to "be strong, and of good courage." The surrounding peers are cheering her majesty, and resuming their coronets. In its general form the composition is circular; of which circle the queen is, of course, the centre: but the artist has so skillfully managed his design as to afford a free and uninterrupted view of her majesty. She looks towards the altar with an expression of countenance in which female sweetness and delicacy, and royal dignity and firmness, are finely blended. The loyal and enthusiastic feeling of the moment has divested the fair, and illustrious, and noble spectators of all apparent formality; and Mr. Hayter has happily communicated to them a variety of position and action, which, probably, was not exhibited at any other period of the august ceremonial. Our limits will not permit us to enter into details on this point; but, as a brilliant instance of what we mean, we cannot refrain from expressing our admiration of the grace with which Mr. Hayter has depicted the replacing of the coronet on the head of the Duchess of Cambridge, by her royal highness's youthful and elegant attendant, Lady Caroline Campbell. This, however, is only one of various incidents which diversify and embellish the scene. In another most important matter the artist has also been eminently successful: we allude to the fidelity of his portraits, and to the masterly way in which he has reconciled that fidelity with the historical character of his work. The colouring and the chiaroscuro are equally entitled to commendation. The former, though rich, is not gaudy. With respect to the latter, by judicious management, the principal light is made to fall on her majesty and the lovelier

portion of the splendid assembly; while warm and powerful reflections prevent any of the figures from being lost in obscurity.

Having said so much in praise of this fine production, may we be allowed, with all due diffidence, to hint at what seems to us to be a blemish in it? We would not do so were it not a blemish which might be most easily remedied, at least in the engraving. We confess that we are not quite satisfied with the personal appearance of the Duke of Wellington. Placed, where he ought to be, in a most conspicuous part of the canvass, it strikes us that Mr. Hayter has somewhat "curtailed" his grace "of his fair proportion." We are aware that the Duke of Wellington is not a tall man, and, perhaps, the proximity of the Duke of Devonshire may contribute to the effect to which we have adverted; but we really do wish that a little more elevation and importance could be imparted to the figure of the illustrious veteran.

#### GRAPHIC SOCIETY.

ON Wednesday last this Society held its fourth meeting for the season; it was very well attended, and the evening was very rich in contributions, by members and visitors, of drawings, sketches, and engravings. Among these we noticed a folio of studies in oil, made amidst the wild scenes of the Tyrol, by Mr. G. Hering; a numerous collection of sketches in the Pyrenees, by Mr. Oliver; Mr. Joseph Nash's original drawings for his recently published work; a volume of studies, by Copley Fielding. Sir William Newton sent three large and beautiful miniature whole-lengths of the Bishop of London; the Queen of Beauty (Lady Seymour), in the costume which she wore at the Eglington Tournament; and the third of a beautiful woman, Mrs. Ogden, and child. Mr. Goodhall's fine print after Turner, just finished, was shewn, and many others, "too numerous to mention," afforded a rich treat to the meeting.

#### NEW PUBLICATIONS.

*Medical Portrait Gallery.* By Thomas Joseph Pettigrew, F.R.S. F.S.A. F.L.S. &c. Parts 22, 23, 24, 25. London, 1840. Whittaker and Co.

THESE four parts, which contain portraits and memoirs of John Brown, M.D.; Richard Powell, M.D.; Galen; G. J. Guthrie, F.R.S.; Thomas Young, M.D. F.R.S.; Thomas Copeland, F.R.S.; and lastly, and most appropriately, a portrait and memoir of the able and intelligent biographer himself, complete Mr. Pettigrew's "Biographical Memoirs of the most Celebrated Physicians, Surgeons, &c., who have contributed to the Advancement of Medical Science." Comprehending, as it does, the lives and characters of sixty of the most eminent men of this and former days, the work is highly interesting and attractive, not only to the profession, but also to the general reader. We are happy to find, from a passage in Mr. Pettigrew's autobiography, that "his labours in medical biography will not cease with this work, as he has undertaken to furnish the principal part of the medical lives in the 'Biographical Dictionary,' now in course of publication, under the editorship of the Rev. H. J. Rose."

#### BIOGRAPHY.

THE LATE HENRY SINGLETON.

AFTER working with the industry of the ant, and the secrecy of the mole, we sometimes ob-

serve the sons of art suddenly burst forth into the light of day, to the great surprise and admiration of the public; and, in some instances, alas! while, for a short time, the splendour of their genius illuminates their path, they are as suddenly swept off to mingle with their kindred clay. Such was the lot of Harlowe, Bonington, and Liversage; and such, although at a very advanced age, was the lot of Singleton. Although long before the public as an exhibitor at the Royal Academy, and in publications of the day, his powers were never fairly and fully developed until the last year of his life. In the spring of that year (1839), his "Cabinet Shakspere" was noticed in our columns; in the autumn of that year he died; and now, in addition to that testimony of his genius, other of his works have been brought to light, which still further display the fertility and versatility of his talents. They are in the possession of Mr. Simpson, of Dean Street, Soho; and consist (besides a few sketches and finished pictures in oil) of a collection of drawings, historical and imaginative, executed with a spirit, taste, and copiousness of invention, such as we have been accustomed to admire in the best works of that class by Cipriani, Cosway, and Lawrence, and by the great masters of the Italian schools:—effusions which, by real judges and lovers of the art, are as highly esteemed, and as carefully treasured, as the more finished labours of the pencil.

## ORIGINAL POETRY.

## THE CLUBS.

"Hercules himself gave up his club when he married."  
JAMES SMITH.  
"CLUBS anti-domestic!" fair ladies, believe  
"Tis a libel on woman, and meant to deceive.  
If the heart of a man at her smile does not warm,  
Let him go to his club—it will do him no harm.  
The papers and pamphlets he'll lightly skim o'er,  
Then dine, play a rub, as he's oft done before;  
But, trust me, not e'en the delights of a rub  
Will take a man, night after night, to "the Club."  
Mamma, with a bevy of beautiful girls,  
All worthy of baronets, some few of earls,  
Declares "tis the clubs,—horrid clubs!—that delay  
The offer, the ring, and the dear wedding-day.  
As if each gay, young bachelor must, all his life,  
Be wed to his club, in disdain of a wife;  
Or as if, when once wedded and happy at home,  
To "the Club" for the sake of a rubber he'd roam.  
"He'll never leave chambers, I'm sure he won't wed;  
He reads, sips his coffee, and then home to bed;  
He has venison and game, claret, sherry, champagne,—  
By accepting our invite, then, what can he gain?"  
Ah! no: where warm hearts hollow eyes that are bright,  
For a distaff he'll give up his club with delight;  
If his lady so wills it, he'll ne'er wish to roam;  
His Omphale's smile kept her hero at home.  
"Unsocial and selfish!"—where music and mirth,  
Kind words and glad faces, enchant the home hearth;  
How idle to hint that "the clubs" keep away,  
From beauty and waltzes, the young and the gay!  
Or grant he's a Benedict,—what, short of strife  
Domestic, will drive him away from his wife?  
Make him happy at home, with his friend and his rub,  
And he'll give up, like Hercules, even his "Club."  
Norfolk Street, January 10. H. B.

## THE DRAMA.

*Drury Lane* we regret to say continues shut, except to a grand political dinner given to Mr. Byng on Wednesday last. It was a festive scene, and one could hardly look at its abundance and rejoicing without thinking of the hundreds of unfortunate persons whose existence depended on the theatre, and who have been thrown out of bread by its calamity. It is a pity the united dramatic corps did not keep it open; but we fear that the performers who can procure engagements elsewhere are not slow to leave those who cannot to shift as they may.

*Olympic*.—We have two new pieces on our list for notice at this theatre. The first, *Ho-*

\* One of the most desperate club-men of his day.

*ratio Sparkins*, a sketch from Boz, is a lively and pleasant trifle, full of bustle and mistakes, at which one must laugh right heartily. Mr. Wrench and Mr. G. Wild are the chief actors, aided by Mrs. Anderson, Mrs. Garrick, and others. Such a thing in the hands of Wrench is sure to succeed. The second novelty, *The Gentleman in Black*, produced on Wednesday with partial success, is a slow piece, with some amusement in the plot, some merit in the acting, some smartness in the dialogue, and, to our taste, neither amusement, merit, nor wit, in any portion of the *double entendre* with which it abounds. Messrs. Jones, G. Wild, Ross, Brookes, Mrs. Anderson, and Miss Atkinson, sustain the principal characters. *The Ladies' Club* continues to draw full houses, though it is for the last time this evening, with, and for the benefit of, its renowned president, Mrs. Glover, who, we hope, will have a bumper on the occasion.

*Philharmonic Concert*.—The musical world has been much gratified by the appearance of two French ladies, sisters, who have made a very favourable impression upon the severely critical audience of the Philharmonic. They have been introduced, it is said, under high patronage, who have every reason to be satisfied with the success of their *début*. The personal appearance of Madame Villowen, and Madame Villowen-Caton, is very prepossessing. To the carriage and manners of gentlemen is joined the perfect mastery of highly cultivated voices of good quality,—a soprano and mezzo-soprano. Of their style, it is sufficient to say that they are pupils of Bordogni; and it adds not a little to the interest which they have created, that family circumstances have induced their appearance in public, and an honourable spirit of independence led them to seek the support they are so likely to receive, by the exercise of their musical talents. Their opening duet, "La Serenata" of Rossini, was gracefully given; but the trial of their power was reserved for Mercandante's splendid duet from Andromio, "Vanne se Alberghi in petto." In this they evinced great compass, joined to perfect finish and refined taste; it was warmly applauded, and we congratulate the directors of the Philharmonic upon having introduced to public notice two ladies who are likely to prove a valuable acquisition to our concert-rooms. The part which they took in a glee of Spohr's with Miss Masson shows that they also possess the great advantage of a clear English pronunciation.

*Hanover Square Rooms*.—The third quartet concert on Thursday was well attended. Correlli's trio for two violoncellos and double bass was admirably performed by Messrs. Lindley, Lucas, and Howell. Beethoven's trio in B flat major, Op. 97, for piano-forte, violin, and violoncello,—Miss Orger, Messrs. Blagrove and Lucas,—was also delightfully played. The vocal music, by Misses Birch and Dolby, was agreeable.

## VARIETIES.

*The Queen*.—We are glad to find her majesty and her royal consort interesting themselves in matters of literature and science. On Wednesday, Mr. Schomburgk (whose travels in Guiana and botanical researches have been so highly prized) was commanded to attend at Buckingham Palace, where he had the honour to exhibit to the royal pair a full-sized coloured drawing of the splendid flower which he fortunately named after our Queen—the *Victoria*

*Regia*. This was greatly admired, as were also five of the views for Mr. Schomburgk's forthcoming work on Guiana. We may notice that her majesty carried on the conversation for a quarter of an hour in the German language, which she speaks gracefully and fluently.

*Royal Anecdote*.—At the Ancient Concert, which was a rich treat, under the direction of H.R.H. the Duke of Cambridge, a very interesting incident occurred, which we are sure it will gratify the people of England to hear. In the tea-room, her royal highness the Duchess of Cambridge approached the queen, and said, "I hope your majesty will allow me the pleasure of placing the hand of an old friend of mine in your majesty's," to which the queen assenting, the duchess led up the illustrious Duke of Wellington, whom her majesty most cordially received, and shook his hand with great warmth and kindness. The happy effect on the surrounding company may be imagined.

*Panorama of Benares*.—Mr. Burford has just opened, at his lower and largest room in Leicester Square, one of, we think, the finest and most picturesque panoramas that ever his beautiful and fertile art produced. The subject is the sacred Hindoo city of Benares, with its temples, some Mahometan mosques, and splendid river scenery, enlivened with native vessels of every form and hue. In this grand picture we know not on which side to turn for the most pleasing effect. Here we have the devotees in groups, rushing from their holy edifices to plunge into the soul-and-body-cleansing stream. There are the tents of an English party, with elephants, laving themselves in the same cooling bath. In the distance a religious procession. Up a reach of the river, a superb view of shipping, resembling the ancient galleys of Cleopatra or other vessels of curious construction. The lucid brilliancy of the water throughout is admirable; and amid all this gorgeousness of architecture and loveliness of nature there is one humiliating native custom to recall us to the weakness and transiency of mortality,—a dark Hindoo corpse, in its last bed of flags and rushes, is floating on the dazzling wave, and the greedy vultures are performing the needful, but to our European ideas, the horrid obsequies of the dead. Altogether, for a representation of Indian character, costume, and customs, this is a noble performance; and combining, as it does, very striking features of land and water scenery, executed with the utmost skill, the Panorama of Benares must be an exhibition of uncommon attraction to the English public.

*Mr. Green's Ballooning*.—Mr. Green has been exhibiting some interesting experiments at the Polytechnic Society, in order to prove that it will be possible to cross the wide Atlantic within the space of four or five days in one of his improved balloons. The impelling motion and certain direction are communicated by fans wrought by machinery; and it is understood that in the course of the summer the aeronaut will repeat the experiments on a larger scale in the open air.

*Spoooner's Panoramic View of the Queen's Marriage Procession*.—A ceremony witnessed by so few, Mr. Spooner has, with his usual activity, prepared this panoramic view; which, as far as we can judge, must afford a very fair idea of the gorgeous scene. It is a long line, and the figures coloured agreeably to the reality—uniforms, court-dresses, and all the various pageantry of official grandeur. As a memorial of interest hereafter, and as an acceptable present to distant friends, few productions of

the kind could be more generally called for and welcome.

**Cambridge Philosophical Society.**—At a recent meeting of this Society, Mr. Airy communicated an account of the construction of the Götting-Fusee adopted in the clock-work for giving equatorial motion to the Northumberland telescope at the Cambridge Observatory. The construction of Harrison's going-fusee was first described; and it was remarked that this construction was likely to be inapplicable to a case like that of the telescope clock-work, which required a very large weight. Another construction of great simplicity (that with the endless rope), invented by Huyghens, and adopted by Fraunhofer, was described; it was, however, pointed out that the difficulty of preventing the rope from slipping would make this construction scarcely applicable. Mr. Airy then described his own construction. It proceeded upon this principle: that in a lever we may produce the same effect, by changing the point of application of force into a fulcrum, and changing the fulcrum into the point of application of a new force, provided that new force be equal to the pressure formerly sustained by the fulcrum. The mechanism was minutely described.

**Salmonida.**—The Royal Society of Scotland has awarded a medal to Shaw, the Duke of Buccleuch's keeper, for having ascertained that the par and the salmon are the same species.

**Good-bad Cons.**—When a child's leg is growing, why does it resemble Africans?—Give it up! Because its *knee-grooves*, too! And why is our reader like the same? Because *he sniggers*, too!

### LITERARY NOVELTIES.

Wind, north-east on the 5th; east on the 6th; north-east on the 7th and two following days; since north.

From the 4th to the afternoon of the 10th, clear; on the afternoon of the 10th, cloudy; the 11th, overcast; a little rain fell during the day. A small meteor, with a long train, seen in the south about 8 p.m. of the 6th. The barometer again remarkably high; exceeding on the 8th inst. that of the 25th ult. by five-hundredth of an inch.—See *Literary Gazette*, No. 1206, p. 141.

Edmonton.

CHARLES HENRY APANE.

### TO CORRESPONDENTS.

Requesting attention to our Paris Letter of last week, we would remark on the important as well as popular matters on which it shows our neighbours to be occupied in their national institutions. Previously we had the account of remarkable experiments on the sugar-cane, and there we had equally important accounts of experiments on gunpowder, of improvements on steam-engines and railroads, of new processes in photography, and other things of great interest. This week's miscellany also relates to several topics of scientific and literary value.

**ERRATUM.**—In the notice of the "Return from Hawking" which appeared in our last number, we attributed a tale of Shensstone's to Prior.

### ADVERTISEMENTS,

Connected with Literature and the Arts.

### BRITISH INSTITUTION,

ALLI, MAIL.  
The Gallery for the Exhibition and Sale of the Works of British Artists is open daily, from Ten in the Morning until Five in the Evening.

Admission, 1s. Catalogue, 1s.  
WILLIAM BARNARD, Keeper.

### TO BOOKSELLERS.—A Gentleman,

many years in the Trade, wishes to meet with a Partnership in an established and well-conducted Concern, where the Principal and anxious to retire from Active Management; or he would be willing to treat with a Party Disposing of such a Business on advantageous Terms.—Communications to be addressed, by letter only (prepaid), to X. Y. Z., care of Mr. Tyler, Printer, Bolt Court, Fleet Street.

### SWAN RIVER.—PROFESSOR

LINDLEY'S Sketch of the Vegetation of this Colony. Illustrated with Coloured Figures of Plants, &c. Price 10s. 6d. This work will be found of considerable interest to all persons desirous of obtaining information concerning the vegetable productions of Australia.  
Kidgway, Piccadilly.

### SALES BY AUCTION.

THE VERY IMPORTANT COLLECTION OF  
Ancient and Modern Engravings

Of a Nobleman of High Rank, deceased.

Messrs. CHRISTIE and MANSON

Respectfully inform the Nobility and Connoisseurs, that they will  
SELL BY AUCTION,  
At their GREAT ROOM, King Street, St. James's Square,  
On MONDAY, MAY 11th, and following days,  
(By Order of the Executors),

The very Important and highly celebrated Collection of Ancient and Modern Engravings of a Nobleman of High Rank, deceased.

In this choice Collection will be found, in the Italian School, rare Nielli; numerous and fine specimens of M. Antonio and his school;—the Master of the Uffizi, Giulio Bonasini, Beatrice, Ennes Vico, the Uffizi, &c.; Specimens of the School of Farnes, Bologna, Venice, and Naples; numerous and fine Specimens of the early German Masters; Kitchings by Rembrandt, and other Dutch Masters, in rare states; a Series of Portraits; also, the fine Collection of English and Foreign Modern Engravings, and a few Books of Prints.

Catalogues are being prepared.

The Renowned Gallery of Pictures  
of the late Sir Simon Haughton  
Clarke, Baronet.

Messrs. CHRISTIE and MANSON

Have the Honour to inform the Nobility and Connoisseurs  
that they are anxious to retire from Active Management; or  
to SELL BY AUCTION,

At their GREAT ROOM, King Street, St. James's Square,  
On FRIDAY, MAY 8th, and SATURDAY, 9th,  
At One o'Clock, precisely.

THE VERY CELEBRATED  
Gallery of Pictures

Of the late SIR SIMON HAUGHTON CLARKE, Baronet,  
is now being removed from Oakhill.

In this Collection, which has for so many years furnished the great attractions to the Exhibitions of the British Institution, and through that source has been made partially familiar to the Connoisseur, it will be merely necessary to particularise the following among the many treasures of Art which it is so well known to possess.—The celebrated and infant St. John, works of Murillo, which have acquired a reputation throughout Europe second to very few of any Master; the Venus disarming Cupid, by Paolo Veronese. The Collection is particularly rich in the Works of Rubens, Tiers, and other great Flemish Masters; the Cabinet Gems of the Dutch School are of the highest quality, and in the purest state.

This short notice must be more than sufficient to excite the interest which so rare an opportunity must create.  
The Collection may be publicly viewed Three Days preceding, and Catalogues had.

The very Valuable and Important  
Library of the late Sir Simon  
Haughton Clarke, Bart.

Messrs. CHRISTIE and MANSON

Respectfully inform the Nobility and Public that they will  
SELL BY AUCTION,

On TUESDAY, MAY 4th, and Two following days,  
At One o'Clock, precisely.

The very Valuable Library

Of the late SIR SIMON HAUGHTON CLARKE, Baronet.  
It is composed principally of the finest works on Art, including all the Great Galleries; Botany, and Natural History, Topography, and General History; and is very rich in French and Italian Literature.

The Library may be viewed Four Days preceding, and Catalogues had.

Assemblage of Fine Painted  
Greek Vases.

By Messrs. CHRISTIE and MANSON,  
On WEDNESDAY, MARCH 18th, at One o'Clock, precisely,

A Very Valuable and Choice Assemblage of

Etruscan Vases and Antiquities,  
Recently brought to this country by that enlightened Antiquary,  
SIGNOR CAMPANARI.

Comprising unusually fine Campana-shaped and other Vases; Amphoræ, Urcei, Tazas, and Patere: of the finest quality, and in high preservation; also some Bronzes, and other Articles of Antiquity, from Campania.  
May be viewed Three Days preceding, and Catalogues had.

### Noble Assemblage of Bronzes.

By Messrs. CHRISTIE and MANSON,

At their GREAT ROOM, King Street, St. James's Square,  
On WEDNESDAY, APRIL 8th, at One o'Clock, precisely.  
The remaining portion of the very superb Assemblage of Bronzes, which was consigned to this country two years since, and will be recognised as having been exhibited for sale by Private Contract in Old Bond Street; it is now directed to be sold in order to close the account.

Among them will be found the Silenus nursing Bacchus; the Faun with the Goat on his shoulders, the size of the original antique marble; a pair of noble Lions, from Neully; Groups from M. Angelo, G. di Bologna, Bartoli, Fagetti, and Gledius; Busts of the Emperors, also of Titus and Commodus.  
Magnificent Fountains, superb Vases and Ewers of Cinque Cento, and old French Designs.  
May be viewed Two Days preceding, and Catalogues had.

### BOOKS IN THE PRESS.

VENERONI'S ITALIAN GRAMMAR.

The Complete Italian Master; containing the best and easiest Rules for attaining that Language. To which are added, an Introduction to Italian Verbiage, Extracts from the Roman Poets, &c. &c. The whole properly accented, to facilitate the Pronunciation of Learners. A new edition, carefully revised, corrected, and improved.

By A. HONNA.

Also, 10th edition revised, 12mo. price 3s. 6d. bound,

BOTTARELLI'S EXERCISES upon the DIFFERENT PARTS of ITALIAN SPEECH, with References to Veneroni's Grammar, and an Abridgement of the Roman Poets, intended at once to make the Learner acquainted with History, and the Idioms of the Italian Language.

III.

A KEY to BOTTARELLI'S EXERCISES; with a few Extracts in Prose and Verse, with English Translations, for the use of Beginners.

By F. R. RUFFA.

New edition, 12mo. 3s. 6d. bound.

London: Longman, Orme, and Co.; Hamilton and Co.; Whitaker and Co.; Duncan and Malcolm; Simpkin, Marshall, and Co.; J. Bouter, Dulan and Co.; and J. Wacey.

## EDUCATIONAL MAPS.

C. SMITH and SON having purchased the Plates and Copyright of the under-mentioned Maps, beg most respectfully to recommend them to the Public, and particularly to those Gentlemen intrusted with the Education of Youth, as eminently calculated to facilitate Geographical Knowledge.

172 Strand.

A Series of Maps for the Use of the National Schools of Ireland, also adapted for Geographical Instruction in general, constructed under the Direction of the Commissioners, by the late SAMUEL ARROWSMITH.

The above Series exhibits the whole World, and consists of the following Maps, viz. :—

## DEDICATED, BY COMMAND, TO HER MAJESTY.

Messrs. HODGSON and GRAVES, Her Majesty's Printsellers and Publishers, have the honour to announce that they are preparing for Publication

A MAGNIFICENT ENGRAVING FROM

## THE ROYAL CORONATION PICTURE.

Painted by GEORGE HAYTER, Esq. Her Majesty's Historical and Portrait Painter.

"The great historical picture of the Coronation of Her Majesty, painted by Mr. Hayter, left Buckingham Palace yesterday morning, with Her Majesty's gracious permission to be engraved and exhibited, having received the highest admiration from Her Majesty, his Royal Highness Prince Albert, and the royal family."—*Court Circular*, Feb. 21, 1840.

This grand Historical Picture will, by Her Majesty's special permission, be privately exhibited during the ensuing Week, in the Rooms of the Publishers. ADMISSION BY TICKETS ONLY.

Present price to Subscribers, Prints, 4*l.* 4*s.* Proofs, 8*l.* 8*s.* Before Letters, 12*l.* 12*s.*

Messrs. HODGSON and GRAVES have authority to announce that they will have the honour to publish an Engraving, upon the same grand scale as "The Coronation," from the very beautiful Picture of

## HER MAJESTY'S MARRIAGE,

BY COMMAND OF HER MAJESTY,

Now Painting in Buckingham Palace, by GEORGE HAYTER, Esq.

Present price to Subscribers, Prints, 4*l.* 4*s.* Proofs, 8*l.* 8*s.* Before Letters, 12*l.* 12*s.*

In addition to the Portraits of Her Majesty the Queen and his Royal Highness Prince Albert, this interesting Picture will contain the Portraits of Her Majesty the Queen Dowager, her Royal Highness the Duchess of Kent, and all the other Members of the Royal Family; his Royal Highness the Duke of Saxe Coburg, and Prince Ernest of Saxe Coburg; the Archbishops of Canterbury and York, the Bishops of London and Norwich, the Officers of State, the Peers and Peeresses, the lovely Bridesmaids, and all the Ladies of Her Majesty's Court; together with numerous other illustrious Personages, all of whom will honour Mr. Hayter with sittings for this grand Historical Picture.

Subscribers' Names received by Hodgson and Graves, Printsellers and Publishers in Ordinary to Her Majesty, and, by special Appointment, to his Royal Highness Prince Albert, 6 Pall Mall, London.

### REVIEW OF NEW BOOKS.

#### THE SLAVE-TRADE.

*The African Slave-Trade and its Remedy.* By T. Fowell Buxton, Esq. 8vo. pp. 582. London, 1840. Murray.

THE first division of this volume was published about a year ago, and briefly noticed by us. The second, and by far the most important, division is new, and evidently deserves the consideration of the public. The former displays the extent and horrors of the slave-trade, and sets forth the statistics of that deplorable traffic in all its ramifications,—the wars and bloodshed of the interior of Africa,—the frightful waste of human life in the transmission of the captives to, and their treatment on, the coast,—the more dreadful usage and ravages of the piratical passage,—and the wretchedness and misery of the final destination,—mercenary, insensate, cruel, barbarous, savage, sanguinary, and hopeless—such are the frightful images of human degradation and crime which this portion of Mr. Buxton's work conjures up; and it is, if possible, to lighten the earth of the load of infamy, that he has addressed himself in the second portion to devise a remedy.

From our review of Mr. Turnbull's "*Travels in Cuba*," &c., three weeks ago (*Literary Gazette*, No. 1206), it appeared that some of Mr. Buxton's calculations might be exaggerated, and some of his data hardly verified. But enough remained to shew the monstrous amount of the evil, and that instead of having been checked by the sacrifices and exertions of Britain, it had absolutely grown in extent and become more detestable in practice. Are we then to give up the cause, or are we to renew our endeavours and try to carry out the humane plans of Mr. Buxton and the benevolent hand who have linked themselves together for the promotion of this most important and Christian end? There can be but one answer from every good man's breast:—"We will go on; and Heaven's blessing go with and prosper us."

The object is, "*the deliverance of Africa by calling forth her own resources*;" and it is gratifying to know that an expedition is now preparing to start on and commence this holy mission. What other specific measures should be pursued are thus explained by the author:—

"We contemplate that her population, instead of being sold into foreign slavery, and of perishing by tens of thousands in the process of transportation, shall be employed in the tillage and in the commerce which may be found at home. In order to do this, we must—1st. Impede and discourage the slave traffic. 2dly. Establish and encourage legitimate commerce. 3dly. Promote and teach agriculture. 4thly. Impart moral and religious instruction. To accomplish the first, we must increase and concentrate our squadron, and make treaties with the chiefs of the coast, the rivers, and the interior. To accomplish the second, we must obtain commanding positions; settle factories; and send out trading ships. To accomplish the third, we must set on foot an agricultural company. Obtain, by treaty, lands for cultivation, with as much power as may be necessary to keep the slave-trader at a distance. The territory we obtain should be freely offered to us,

without any kind of constraint. It should be in the vicinity of some navigable river. The climate should be, for Africa, healthy. The soil should be capable of growing tropical productions. Its limits should be extensive. To accomplish the fourth, we must support the benevolent association now established. Besides these special purposes, there is one general object, which must be carefully provided for, viz. that the agents employed in Africa, whether on their own account, or in connexion with an association at home; whether engaged in commerce, cultivation, or instruction, may be sufficiently protected. Of the work to be done, a part belongs to the government, and a part must be executed by individuals. The government should take on itself the whole duty and expense of preserving the peace, and of affording the necessary protection to new British settlements in Africa. Increase and concentrate our naval force. Obtain Fernando Po, and such other commanding positions as may be found necessary. Prepare, instruct, and send out embassies with all practicable despatch (or authorise their African governors), to form treaties, including either or all of the following points, viz.:—prevention of slave traffic; arrangements for legitimate trade or cultivation, with such privileges and powers as may be necessary for their well-doing; and with grants of land for cultivation. The part which devolves on individuals interested in the fate of Africa is,—1st. Strenuously to assist the benevolent association already mentioned; the objects of which are, to assist individuals or societies who may engage themselves in the task of educating the population of Africa; to promote by every means in its power, direct and indirect, its civilisation, cultivation, and commerce; to obtain and circulate statistical, geographical, and all other information concerning that country, especially availing itself of the opportunity shortly to be presented of doing so, by appointing agents to accompany the expedition which it is intended to send out in the ensuing autumn; and, lastly, to keep alive the interest of the people of England on the subject.—2dly. To form an agricultural company, which shall, hereafter, send out persons well acquainted with tropical climates and productions; to form settlements, guided by such arrangements and treaties as the government may have made; to commence pattern farms and establish factories well supplied with European goods; in a word, to use all the means that experience may point out for a profitable and successful employment of British skill and capital in the African continent. No slavery, no monopoly, forbearance towards the natives, and utter enmity towards slave-trade and slavery in all their forms, must be the fundamental principles of such a company; and an honest adherence to these will, in my full belief, insure its prosperity and profit."

"I have," Mr. Buxton adds, "proposed two associations, a benevolent society, which shall watch over and befriend the interests of Africa, and a company which shall cultivate her soil. In one sense they are entirely separate; the object of the one is charity—of the other, gain. As they are distinct in their principle,

so, I think, they ought to be kept entirely separate in the prosecution of their details. Yet it is impossible that they should not subserve and benefit each other. It is impossible to spread education, scientific knowledge, and the civilising influence of Christianity, without communicating that to the population which will most materially contribute to the advance of commerce and agriculture: on the other hand, there is no better way of advancing the moral and physical condition of the people, than by the introduction of our skill and the sagacious and successful employment of our capital amongst them. To the question which has already been repeatedly put to me, by those who have been moved to compassion by the sorrows of Africa, 'What shall we do?' my answer is, 'Join the African Institution, which we are endeavouring to revive; and join the African Agricultural Association, which we are about to establish.'"

The cession of Fernando Po, to command the delta of the Niger, seems very important; and it is to be hoped that Lord Clarendon, with his great influence at Madrid, may be able to obtain it. There is another point of much interest (as, to a certain degree, it divides the opinions of the friends to the undertaking) which is thus disposed of by Mr. Buxton:—

"In my book I propose two distinct courses; and I couple them together in the same work, because the arguments employed bear upon each of these separate questions. In other words, I apply to the government to do one thing for the suppression of the slave-trade, viz. to strengthen our squadron; and I apply to individuals to join me in measures having the same object, but of a character totally different. Such, for example, as an attempt to elevate the mind of the people of Africa, and to call forth the capabilities of her soil. I have no wish to disguise my sentiments about armed force. I deprecate, as much as any man, resorting to violence and war. These are against the whole tenour of my views. It will be admitted, I think, that I have laboured hard in this book to shew, that our great error has been, that we have depended far too much upon physical force. It is, however, the duty of our government to see that the peace of our settlements be preserved. The natives whom we induce to engage in agriculture must not be exposed to the irruption of a savage banditti, instigated by some miscreant from Europe, whose vessel waits upon the shore for a human cargo. Nor must our runaway sailors repeat in Africa the atrocities which have been practised in New Zealand. Again and again the Foulah tribes said to the missionaries on the river Gambia, 'Give us security, and we will gladly till the land and pasture the cattle in your neighbourhood.' There were no means of thus protecting them, and hence an experiment, founded on admirable principles, failed. But when I ask for an effectual police force, I ask for that only. I do not desire the employment of such a military force as might be perverted into the means of war and conquest. I want only, that the man engaged in lawful and innocent employment in Africa, should have the same protection as an agricultural labourer

or a mechanic receives in England; and that there, as well as here, the murderer and man-stealer may be arrested and punished."

We like this fair and candid avowal of principles; and we like more the enthusiastic feeling embarked in this noble cause. Difficulties there are great and many, and men of limited views and timid minds will predict that they cannot be surmounted, that it is needless to attempt it, and all such poor commonplaces; but nothing truly grand and valuable was ever achieved in this world by attending to such weak and wavering allies: the word must be, *Forward!*—and the encouragement not only the consciousness of a glorious purpose, but the conviction that nothing worthy of attainment was ever reached without ardent energy and indomitable perseverance. We are not for highly-wrought feelings to supersede cool judgment; for the revival of crusades or knight-errantry instead of wisdom in action. But we must have spirit, enterprise, enthusiasm, and, above all, a moral belief that there are no obstacles in our way over which we have not the power to triumph.

And for whom are we to encounter these difficulties and conquer these obstacles?—for no less than a population of fifty millions of human souls, who inhabit the fertile and productive regions of Central Africa. To restore them to humanity, from the dark and bloody dominion of ignorant superstition; to call their country, with a fine soil and intersected by noble rivers, into industry and happiness;\* and to uproot for ever the most odious and debasing system which mortal blindness ever erected—the system of destructive and remorseless slavery.

Mr. Buxton truly observes in various passages:—

"In one respect I apprehend no liability to error. With all confidence we may affirm, that nothing permanent will be effected unless we raise the native mind. It is possible to conceive such an application of force as shall blockade the whole coast, and sweep away every slaver; but should that effort relax, the trade in man would revive. Compulsion, so long as it lasts, may restrain the act, but it will not eradicate the motive. The African will not have ceased to desire and vehemently to crave the spirits, the ammunition, and the articles of finery and commerce which Europe alone can supply; and these he can obtain by the slave-trade, and by the slave-trade only, while he remains what he is. The pursuit of man, therefore, is to him not a matter of choice and selection, but of necessity, and after any interval of constrained abstinence he will revert to it as the business of his life. \* We may assume, and with almost equal confidence, that Africa can never be delivered till we have called forth the rich productiveness of her soil. She derives, it must be confessed, some pecuniary advantage from the slave-trade; happily, however, it is

the smallest possible amount of revenue at the largest possible amount of cost. The strength of our case and the foundation of our hope lie in the assurance—I am tempted rather to call it the indisputable certainty—that the soil will yield a far more generous return. Grant that the chieftains sell every year 250,000 of the inhabitants, and that into their hands 4*l.* per head is honestly paid. (This is not the fact, however, for they are often defrauded altogether, and are always cheated by receiving merchandise of the most inferior description.) But let us suppose that they get the value of one million of money; we have, from this sum, to deduct, first, the cost of maintaining their armies intended for the slave-trade; then of the reprisals which are made upon themselves, and the consequent ravage of their land and destruction of their property; thirdly, the material items of arms, ammunition, and ardent spirits, which form one-third of the whole of the goods imported into Central Africa, and the greater part of which are consumed in their horrid slave-hunts;\* to say nothing of any indirect loss, such as millions of fertile acres being left a desert;—nothing of perils encountered and torments endured; making no other abatement than the three sources of direct and unavoidable expense which I have named,—the million will have melted away to a very slender sum. Call the clear profit, for argument's sake, 300,000*l.*; and is 300,000*l.* all that can be reaped from so extensive a portion of the globe, inferior to none other in native wealth? Her fisheries, separately taken, would yield more; or her mines, or her timber, or her drugs, her indigo, or her sugar, or her cotton. I am then steadfast in my belief, that the capabilities of Africa would furnish full compensation to that country for the loss of the slave-trade. It may sound visionary at the present time, but I expect that at some future, and not very distant day, it will appear, that for every pound she now receives from the export of her people, a hundred pounds' worth of produce, either for home consumption or foreign commerce, will be raised from the fertility of her soil.

"Treaties should be formed with native powers in Africa—they receiving certain advantages, proportioned to the assistance they afford in the prosecution of our objects, and engaging on their side to put down the slave-trade. I do not mean to say that this is all that ought to be contemplated in these treaties; to give facilities for commerce and agricultural settlements will be a subject of consideration hereafter. All I urge at this point of the argument is, that we should do our utmost to obtain the cordial co-operation of the natives in the suppression of their detestable traffic. \* I suspect it will be very difficult to gain the concurrence of the chiefs on the coast: these, in the words of a gentleman who has spent many years in studying the geography of Africa and the character of its inhabitants, are 'a rabble of petty chiefs, the most ignorant and rude, and the greatest vagabonds on earth!' They have been rendered habitual drunkards by the spirits which slave-ships supply. As slave-factors, they have been steeled against all compassion and all sympathy with human suffering; and no better influence has been exercised over them, than that derived from intercourse with the dregs of Europe. Besides, they obtain a two-fold advantage from the slave-

trade. The goods they obtain from Europeans give a considerable profit when sold to the natives, while the slaves, received by them in return for those goods, yield a profit still more considerable when sold to the slave-captain. We must then expect great opposition from the chiefs on the coast. It appears, indeed, from the journals of all travellers in Africa, that every impediment has been thrown in their way, in order to prevent their proceeding to the interior of the country. It is, however, some consolation to learn from recent travellers, that the power of these chiefs has been greatly exaggerated. But whatever difficulties we may have to encounter with the chiefs on the coast (and I confess that, viewing their character, and the insalubrity of the climate near the sea and at the mouths of rivers, I apprehend that they will be far from light), there is good reason to believe that we shall find a much better disposition on the part of the sultans and sovereigns of the interior, to receive, to treat, and to trade with us.

Thus (he continues) I have suggested two distinct kinds of preparatory measures. 1st. An augmentation of the naval force employed in the suppression of the slave-trade, and the concentration of that force on the coast of Africa, thus forming a chain of vessels from Gambia to Angola. 2dly. A corresponding chain of treaties with native powers in the interior, pledging them to act in concert with us; to suppress the slave-trade in their own territory; to prevent slaves from being carried through their dominions, and, at the same time, to afford all needful facility and protection for the transport of legitimate merchandise. Thus, by creating obstacles which have not heretofore existed, in the conveyance of negroes to the coast, and by increasing the hazard of capture after embarkation, I cannot but anticipate that we shall greatly increase the costs, and multiply the risks, of the slave-trade. If I am asked, whether I expect thus to effect its total abolition, I answer distinctly, No:—such measures may reduce, or even suspend, but they cannot eradicate the evil. If we succeed in establishing a blockade of the coast, together with a confederacy on shore, and proceed no further, it will still be doubtful, as it has been in our former operations, whether more of good or of evil will be effected;—good, by the degree of restraint imposed on the traffic, or evil, by rendering what remains concealed and contraband; and when I recur to the fearful aggravation of the sufferings of the slaves, which has already arisen from this cause, I am almost disposed to think that it were better to do nothing than to do only this. I propose the two measures I have just named, not as a remedy, but as an expedient necessary for a time, in order that the real remedy may be applied in the most effectual manner. For a time, the dangers and difficulties of the slave-trade must be increased, in order that the demand for slaves on the coast may be reduced in the interval that must necessarily elapse before a total suppression can be effected. There was a time, during the last war, when our cruisers were so numerous in the African seas, that it was difficult for a slaver to escape; and it was then observed that the chiefs betook themselves to agriculture and trade. The greater the impediments that are thrown in the way of obtaining supplies through the accustomed channels, the stronger becomes the inducement to procure them in another and better mode; and thus, the diminution of the slave-trade will operate as an encouragement

\* Its productions are:—*Animals*.—Oxen, sheep, goats, pigs, &c.; guinea-fowls, common poultry, ducks, &c. *Cereals*.—Rice, Indian corn, Guinea corn, or millet, wheat, Dourah, &c. *Fruits*.—Oranges, lemons, guavas, pine-apples, limes, papaws, plantains, bananas, dates, &c. *Roots*.—Manioc, igname, batata, yams, arrow-root, ginger, sweet potato, &c. *Timber*.—Teak, ebony, lig-num vitae, and forty or fifty other species of wood for all purposes. *Nuts*.—Palm-nut, shes-nut, cocoa-nut, cola-nut, ground-nut, castor-nut, netta-nut, &c. *Dyes*.—Carmine, yellow (various shades), blue, orange (various shades), red, crimson, brown, &c. *Dye-woods*.—Camwood, bar-wood, &c. *Gums*.—Copal, Senegal, mastic, sudan, &c. *Drugs*.—Aloes, cassia, senna, frankincense, &c. *Minerals*.—Gold, iron, copper, emery, sal-ammoniac, nitre, &c. *Sugar-cane*, coffee, cotton, indigo, tobacco, India-rubber, bees'-wax, ostrich-feathers and skins, ivory, &c. *Fish*.—Of an immense variety, and in great abundance."

to industry and a stimulus to commerce. And the evil being thus temporarily held in check, time and space, so to speak, will be given for the effectual operation of the remedy."

Our treaties, to be effectual, must be on the largest possible scale with the most powerful chiefs of the Foola, Felatah, Bornou, &c.; and it should be held in view, that we must have strong temptations to hold out to these rulers to induce them to make so entire a change in their policy by giving up the main source of their savage and despotic power. To these belong "Timbuctoo, the great emporium of trade in central Africa. The powerful kingdom of Gago, 400 Arabic miles from Timbuctoo to the south-east, abounds with corn and cattle. Guber, to the east of Gago, abounds with cattle. Cano, once the famous Ghana, abounds with corn, rice, and cattle. Caahna Agadez, fields abound with rice, millet, and cotton. Guangara, south of this, a region greatly abounding in gold and aromatics. Balla, celebrated for its fine gold, four months' voyage to Timbuctoo. Bournou, its capital very large, and inhabitants great traders. The country very rich and fertile, and produces rice, beans, cotton, hemp, indigo in abundance, horses, buffaloes, and horned cattle, sheep, goats, camels, &c. Yacorie produces abundance of rice. The country between R. Formosa and Adra affords the finest prospect in the world. Inland it is healthy, and the climate good. Trees uncommonly large and beautiful, cotton of the finest quality, amazingly plentiful, and indigo and other dye-stuffs abundant. The Jabboos carry on great trade in grain between Benin and Lagos. Boosaa is a large emporium for trade; the place where the people from the sea-coast meet the caravans from Barbary to exchange their merchandise. From Boosaa to Darfur there are numerous powerful, fertile, cultivated, well-wooded, watered, populous, and industrious states. Benin, Bournou, Dar Saley, Darfur, Kashua, Houssa, Timbuctoo, Sego, Wassenah, and many others, are populous kingdoms, abounding in metals, minerals, fruits, grain, cattle, &c. Attah, on the Niger, healthy, many natural advantages, will be a place of great importance, alluvial soil, &c. The places on the banks of the Niger are rich in sheep, goats, bullocks, &c. Fundah, population 30,000; beautiful country. Doma, population large and industrious. Beeshle and Jacoba, places of great trade. Rabba, population 40,000. Toto, population immense. Alorie (Feletah), vast herds and flocks. Bumbum, thoroughfare for merchants, from Houssa, Borgoo, &c., to Gonga, vast quantity of land cultivated. Gungo (Island), palm-trees in profusion. Egga, two miles in length; vast number of canoes. Egga to Bournou, said to be fifteen days' journey. Tachadda, on its banks immense herds of elephants, seen from 50 to 400 at a time."

Free trade and free labour must be the elements of this great work; and we entirely agree with the writer, that

"It should be made manifest to the world by some signal act, that the moving spring is humanity; that if England makes settlements on the African coast, it is only for the more effectual attainment of her great object; and that she is not allured by the hopes either of gain or conquest, or by the advantages, national or individual, political or commercial, which may, and I doubt not will, follow the undertaking. Such a demonstration would be given, if, with the declaration that it is resolved to abolish the slave-trade, and that in this cause we are ready if requisite to exert all our powers,

Great Britain should couple an official pledge that she will not claim for herself a single benefit which shall not be shared by every nation uniting with her in the extinction of the slave-trade; and especially, first, that no exclusive privilege in favour of British subjects shall ever be allowed to exist; secondly, that no custom-house shall ever be established at Fernando Po; thirdly, that no distinction shall be made there, whether in peace or in war, between our own subjects and those of any such foreign power, as to the rights they shall possess, or the terms on which they shall enjoy them. In short, that we purchase Fernando Po, and will hold it for no other purpose than the benefit of Africa."

With this we must conclude, leaving the vitally essential statements on the means of introducing education and spreading civilisation over the land, to the readers of Mr. Buxton's volume, which is one, indeed, involving matters of immense present and future consequence. Most heartily and sincerely do we unite in wishing the effort unbounded success; and happy shall we be if we can recall it on our pillow, that the *Literary Gazette* has contributed, even in the smallest degree, to disseminate a knowledge and promote the progress of so mighty and so benevolent a cause.

*Narrative of a Voyage to Madeira, Teneriffe, and along the Shores of the Mediterranean, including a Visit to Algiers, Egypt, Palestine, Tyre, Rhodes, Telmessus, Cyprus, and Greece. With Observations on the Present State and Prospects of Egypt and Palestine, and on the Climate, Natural History, Antiquities, &c. of the Countries Visited.* By W. R. Wilde, M.R.I.A. Licentiate of the Royal College of Surgeons in Ireland, &c. 2 vols. 8vo. Dublin, 1840. Curry, jun. and Co.; London, Longman and Co.

THIS is a long title-page, but it explains the nature of the publication and the medical character of the writer sufficiently to spare us the trouble of recapitulation. Mr. Wilde, M.R.I.A., travelled in the capacity of a medical friend to Robert Melklam, Esq. M.R.Y.S., which may mean Member of the Royal Yacht Society; but, at all events, their peregrinations were performed in a clipping yacht of 130 tons burden, in which they could sail where, when, and whither they liked, in search of climate or pleasure to restore the invalid to health. It may readily be supposed that a voyage of this kind, and under such auspices, was likely to be *Couleur de Rose*; and in point of fact we find the author, in general, pretty well satisfied with his reception and treatment every where. Of Madeira and the Canaries he speaks well, as sojourns for consumptive and delicate patients; and, proceeding onward, gives us light sketches of the various shores and places on his extending route. If in these there is not much of absolute novelty or importance, they deserve the praise of being lively and agreeable; of which we shall endeavour to afford a few proofs from the least familiarly known parts described in the second volume, commencing, however, with a bit of useful advice from the first relative to sea-sickness, which is given without a fee:—

"Notwithstanding (says Mr. Wilde) the sea had lulled, it blew a stiff breeze still, and the Crusader rolled and tossed upon the huge toppling waves of the Atlantic in such a way that I was again sick; but having some little experience of what genuine sea-sickness really is, since crossing the Bay of Biscay, I managed to avoid much of the unpleasantness I then suf-

fered, principally by the following means, which I would strongly recommend to all landsmen. If you feel sickish, or know by experience that you will be sick, go to bed, close your eyes, and remain lying on your back, if possible without motion; abstain from food, but not altogether; I would rather say, eat sparingly, and of some solid, such as a little broiled meat, or biscuit, as I have known most alarming consequences arise from 'total abstinence,' to say nothing of the violent straining and fruitless retching it occasions. Drink sparingly of cold water, or brandy and water in sips, but taste no hot liquid of any kind. In keeping the eyes shut, I would remark, that the effect of vision and its sympathy with the stomach are not enough attended to; for though at rest in the berth, the swinging backwards and forwards, and motion of the vessel and things around, are often sufficient to produce what we so much wish to avoid. There is, however, one point at which emesis becomes inevitable—it is, when the mouth fills with saliva, and then the sooner it takes place the better."

The most interesting part of Mr. Wilde's work is certainly that which relates to Tyre, respecting which, he read a paper in the geographical section at the Birmingham meeting of the British Association, and to the enlarged notice of which we now turn. We shall not, however, enter into his disquisition upon the coexistence of two separate cities of the same name, the one insular, and the other on the main land; nor the remarkable fulfilment of the prophecies which he points out. The following quotation upon the subject of some interesting antiquarian remains is better suited to our pages. After describing a rock about a mile from the sea, by which the famous aqueduct runs, Mr. W. says:—

"The highroad to Sidon passes by this rock; and pursuing it northward for about half a mile we came to a low range of hills, which terminated the plain in this direction. These ascend gradually to the more elevated heights of Lebanon. In the sides of these hills I found an extensive series of catacombs, cut in the face of the white sandstone rock of which they are composed; and which, from their colour, cause them to be distinguished at some distance on the plain. The ground about these catacombs is much broken, and is now covered with a plantation of fig-trees. The moment I entered the first of these tombs, exhibited in the accompanying engraving, I was struck not only with the resemblance, but the exact similarity they bore to the Egyptian catacombs, especially to those of Sackara and Alexandria. Like them they have a low square doorway opening into a chamber, varying in size from ten to fifteen feet square, containing three horizontal sarcophagi, or places for bodies, one on each side. The doorway or entrance fills up the fourth side; the whole carved out of the solid rock, which, like that of Egypt, is soft and easily excavated. In another place we found a large circular aperture in the ground, which had around it the entrances to eight tombs. In a third place was an immense deep excavation in the rocks, which we approached by a winding descent. This is nearly as large an excavation as that on Mount Pentellicus, and may, like it, have been originally a quarry for the old city; but in the sides of it are the obvious remains of several tiers of sarcophagi. With few exceptions, the doors of all the tombs look towards 'the rock.' Their similarity to the Egyptian, Grecian, and Irish, I shall have occasion to notice hereafter. I had, however,

but little time to examine them in detail. They are, doubtless, of great extent, and just in the spot that we would expect to find the burial-place of a city—the side of a neighbouring hill. Porcupines in great numbers have taken possession of many of the excavations, throwing up large piles of rubbish about their mounds, which, as well as their being choked with weeds and brambles, together with the lowness of the apertures, served at first to conceal them from our view. No traveller that I am aware of has described these chambers, though they are well worthy of observation, not only as giving an explanation of the mode of burial practised by the Tyrians, but as helping to fix the site of original Tyre; and of considerable moment in shewing the intimate connexion of its inhabitants with the Egyptians. The people here seem to know nothing about them; but their vicinity to this mosque, the appearance of the rocks, and their being on the side of the road leading to Sidon, will point out their site to future explorers."

Again, on the coast of what is now a peninsula, Mr. W. observes:—

"The shore here demands particular attention, as it contains the remains of houses, the foundations of some of which are in many places still to be seen. In the perpendicular face of the beach we found the floors of these ancient houses, marked by whole strata of tessellated pavement, which shew that the level of the peninsular city was from eight to ten feet below the present surface; the intervening portion being composed of broken crockery-ware, pieces of marble, and rubbish. This pavement was of three different kinds; the first was composed of small bits of marble of from one-half to three-fourths of an inch square; another of small bricks or tiles; and the last of small portions of broken brick thrown into a bed of mortar, which were wrought together and afterwards smoothed down and polished. While examining the remains along the shores of this harbour, I found a number of round holes cut in the solid sandstone rock, varying in size from that of an ordinary metal pot to that of a great boiler. Many of these holes were seven feet six inches in diameter, by eight feet deep; others were larger, and some were very small. They were perfectly smooth in the inside, and many of them were shaped exactly like a modern iron pot, broad and flat at the bottom, and narrowing towards the top. Some were found detached, and others in a cluster; when the latter occurred, two or three of the holes were connected by a narrow channel cut through the stone about a foot deep. Many of these reservoirs were filled with a breccia of shells. In other places, where the pots were empty, this breccia lay in heaps in the neighbourhood, as well as along the shore of this part of the peninsula. It instantly struck me on seeing these apertures, that they were the vats or mortars in which was manufactured the Tyrian dye. I am confirmed in this opinion by the fact, that the species of shell discovered in this breccia corresponds exactly with that described by the old authors, as that from which the colour was extracted, and from which a purple dye can be obtained, even at the present day; and it is acknowledged as such by modern naturalists. Although I broke up large quantities of these masses, in no instance could I find a single unbroken specimen, which I certainly would have found had they been rolled in from the sea, or were in a fossilized state. I picked up one of the recent shells upon the shore, which corresponds in

every respect with those formed in the conglomerate. The stones in the vicinity of this place were covered with large serpulæ. The binding material of this mass is lime, and a trace of strontian; and the only substance found in connexion with them are a few pebbles. This substance is of great weight, and adamantine hardness, and is of the same character as the petrified strand which I have already mentioned as existing at Rhodes, and in Karamania. Now, it seems to me more than probable that the shells were collected into these holes, or, as they might be more properly called, mortars, in which they were pounded for the purpose of extracting from them the juice which the animal contained; and in this opinion I am borne out by Pliny the naturalist, who says, that 'when the Tyrians light up any great purples, they take the fish out of the shells to get the blood; but the lesser they press and grind in certain mills, and so gather that rich humour which issueth from them.' These vats may have been also used for steeping the cloth; for dyeing pots, cut either in the rock or formed of baked clay sunk in the earth, are still found in many parts of the East, and may be seen in use in some of the by-streets of Alexandria and Grand Cairo, bearing some resemblance to our tan-pits. Such places as these are still used for indigo dyeing throughout Africa. The shells of which this mass is composed (a portion of which is now in my possession) are all of one species, and are pronounced by eminent naturalists to be the *murex trunculus*, which conchologists admit was one species from which the Tyrian dye was obtained; but until now no proof could be given of its being the actual shell."

The Appendix contains an inquiry into the nature and properties of this celebrated Tyrian dye,\* and of others of a like kind, which may be perused with advantage; whilst we pass to our concluding specimen of the work, which refers to a cemetery at Jerusalem, opened about the time our author was there, and examined by him:—

"Having (he says) heard a rumour of a tomb that had been lately discovered and opened by the Arabs in this vicinity, and it being reported that some human remains were found in it, I rode out one evening during our sojourn in Jerusalem to examine the place, accompanied by two of my companions, Mr. W. Meiklam and Mr. Finlay. A little higher up in the cliff that rises from the cavern erected by the Roman empress, within the ground denominated Aceldama, and in the neighbourhood of the painted chambers, and that excavation called the tomb of Isaiah, some Arabs, when at work in the place, accidentally discovered the door-way of a tomb carved out of the solid rock, which had been concealed by a heap of rubbish, over which the soil had accumulated so as to completely conceal the entrance. Such was the account given to me by credible witnesses in Jerusalem. This entrance at the time of our visit was still partly concealed by brambles, stones, and dirt, so that but one-half of the doorway was visible.

"The most remarkable circumstance connected with this façade was its door, which

\* In a late number we reviewed a book full of anecdotes of law and lawyers: the following *Jeu d'esprit*, of which this subject reminds us, might have found place there. Serjeant C. was of a very rubicund countenance, and sometimes rather prolix in his arguments. On one occasion when, in the full-dress costume of his court, he was delivering a very long speech, a wit by his side wrote this epigram:—

"The serjeant pleads with face on fire,  
And all the court may rue it;  
His purple garments wane from Tyre,  
His arguments go to it."

struck me the moment I saw it as being totally different from that of any other tomb that I had ever seen or read of, except one at Petra. It is formed of a single slab of stone, and moves on horizontal pivots that run into sockets cut in the pilasters at top, in the manner of a swinging hinge; similar to that which is sometimes seen in the doors of cottages in this country. The lower part of it had been, I was informed, broken off by the Arabs in order to effect an entrance. It is the only outside door of a tomb that I have ever seen, and it differs from all others in not having been formed for concealment, or for being completely closed when the body was deposited within; but was evidently made for the purpose of being opened occasionally. Having entered beneath this ponderous portal and lighted our candles, we were greatly surprised to find ourselves within a tolerably sized hall of an oblong shape, cut with great precision out of the rock, but without ornament or adornment of any kind whatever. Curious to relate, the whole of this tomb afforded a most striking illustration of its appropriateness to describe the character of the self-righteous Scribes and Pharisees; and shewed the forcible application of the language used by the Saviour when denouncing their hypocrisy: 'Wo unto you, Scribes and Pharisees, hypocrites! for ye are like unto whited sepulchres, which indeed appear beautiful outward, but within are full of dead men's bones, and of all uncleanness.' At the end, and on either side of the hall, a number of doors led into inner apartments. Each of these chambers was a small oblong crypt, about seven feet long; on either side of which was a trough or sarcophagus, hewn like all the rest of the tomb out of the solid rock, and raised about three feet from the floor, and in all of them were quantities of human bones lying without order or regularity, but in a state of most astonishing preservation. The edges of these troughs were in many places chipped and broken, as if from long use; and the whitewash had not only coated these parts, but had actually spotted several of the bones that lay low down in the bottoms of the troughs. These bones were piled in layers, and as each trough contained several, the whitewash must have been used subsequently to some of the bodies being placed within them. This whitewash (which is the only instance of the kind that has yet been discovered of that ancient Jewish custom), was in a most extraordinary state of perfection; and, from the number of layers that could be seen, on picking it off the wall, it was evident that it had been frequently renewed. Such was the appearance that this tomb presented when we examined it; and such I was informed was its state when discovered. But the most remarkable feature in this catacomb was, that each set of crypts, that is, those on the three different sides, contained the remains of *distinct and separate races of mankind*, as shewn by the skulls found in the trough of each.\* Thus all the crypts upon the right-hand side contained crania of the same characters, shape, and appearance, as that represented in plate i. fig. 1; whereas all those upon the opposite, left-hand side, were of a shape the very reverse, as seen in plate ii. fig. 4; and in the end or central compartments I found skulls totally different from either, and partaking, more or less, of the extraordinary form of that shewn in fig. 3 of plate i. On this side of the

\* "Could it have been a tomb of this description that is mentioned in Jeremiah, xxvii. 23, where the prophet says that Jehoiakim, when he saw Uzziah, 'cast his body into the grave of the common people?'"

apartment, however, the crania were more mixed, and not at all so decided as those in the two other sets of chambers that I have mentioned. But, although I searched with some care, I could not find a single instance of the skulls of one side being mixed up with those of the other; all were perfectly distinct, and separated from each other. Now none of these curious heads belonged to the Jewish race, for not one single European or well-marked Caucasian head could I find among the numbers scattered in the chambers; and as all who did not belong to that family must have been strangers in Jerusalem—and as these heads belonged to races of mankind that we know did not inhabit Judea for the last two thousand years, they must have been foreigners; and this has led me to conjecture that this tomb, which is situated in the acknowledged field of blood, may be one of those sepulchres of the *actual Acelidama* that was purchased by the priests 'to bury strangers in.'

We have only to add, that the plate is not necessary for the perfect understanding of this statement.

HAYWARD'S ANNALS OF ELIZABETH.  
Second notice: conclusion.

WE concluded our previous notice of this volume by an allusion to the treatment which Mary of Scotland received from her "cousin" Elizabeth. The earlier movements of this "less than kind" kinswoman's conduct are illustrated by her great admirer, in the following passages. On the death of her husband, Francis II. we are told:—

"Shee moved discourse with her selfe, that the dangers of the journey shee had undergone before; the feare from the Queene of England she ment to remove by procuring good assurance from her; the countrie of Scotland shee esteemed not soe farr inferiour to France as a private persone is inferiour to a prince. And that for twoe respects that countrie did suite well enough with her liking, one, for that it was the place of her birth, the other for that it was the seate of her sovereigntie. The disorders which had sometime bene raysed by the people, shee much imputed to unskillfull government, in striving to reduce them to a stricter subjectione then that whereto they had bene accustomed. But, whensoever ther kings attempted not to impeach ther liberty, they lived without danger of honor, or of life; they wer not onely maintained free from inward tumultes, but made invincible against ther enemies. Shee nothing mistrusted the disability of her sexe; for, besides a generall respect that men beare towards women, in regard whereof many people would be governed onely by princes of that sexe; besides her large endowments of nature, a lovely and lively countenance, a fayre feature, fine and piercing witt, a mild and modest dispositione, and then in the flower of beauty and youth (strong strings to draw men to duty and love); besides an affable and curteous behaviour, fashioned by her education in the court of France,—shee intended not to make any alteratione from the present state of affayres in Scotland. Soe shee prepared for her passage, and in the meane tyme went into Lorraine to take leave of her kindred by the motheres side. The Queene of England about this tyme sett fourth certeyne of her greate shippes to sea, according to the yearly custome of the realme, to guard the coastes, to scour the seas, and to be in a redinesse for all adventures. This was interpreted by some to be done for intercepting the Queene of Scotts in her passage; wherenpon shee sent

the Abbot of St. Colmes Inch to the Queene of England, to require a safe conduct, in case shee should be enforced by any accident to land in England. Shee sent alsoe Monsieur Doysell to passe through England into Scotland, their to receive the fortes of Dunbarre and Inskieth of Monsieur Charlebois, and to keepe them untill her comeinge thither. Monsieur Doysell was stayed at London, for it was conceived that his presence in Scotland would not onely breede distrust and discord among the Lordes, as having bin one of the principall authores of all the troubles the yeere before, but alsoe be nothing safe for the Queen; because it is noe lesse dangerous to princes to have hatefull men in place of office and authoritie neere unto them, then if they should be hatefull themselves. The safe conduct was granted, and all offices of honor assured to the Queene of Scottes, which, in regard eyther of amity or of blood, shee could expect, in case it should stand with her pleasure to take her journey through England; but, if shee should passe that waye and not vouchsafe to visit the Queene, it would be taken in very evill part. Before the Abbot was returned with his message, and safe conduct to Calleis, the Queene of Scotts, having the advantage both of a greate calme and thicke mist, adventured to sea in certayne French gallies, and arrived safely in the roade of Lieth. The mist covered them from the sight of the English shippes, which, alsoe by reasons of the calme, wer unable to stirre; yet was one shipp taken by the English and brought to London, wherein the Earle of Eglinton and some others of the Scottish nobility did passe; but it was presently discharged, and permitted freely to depart. In company of the Queene of Scottes went three of her uncles, the Duke Daumale, the Grand Prior, and the Marquesse Dalboeufe; and, with them, Monsieur Danvill, the Constable's sonne, and divers others of the nobility of France."

When Mary's ambassador sought to induce Elizabeth to declare the succession:—

"'Indeede' (sayd the Queene), 'if I had attempted any thing to the prejudice of your Queene, then had the cause of your demand bene just. But in this request, whilst I am alive, in good state of body, in the principall strength and flourish of my yeares, I should have my wynding sheete presented unto mee. This exceeds all example: the like was never required of any prince before. And yett the mynd of your nobility I take in good part, for that I perceive they have a desire to advance the dignity of their Queene. I doe not lesse allow ther wisdomes, both in providing ther owne safety, and in preventing the expense of Christian blood, wherof (I confesse) there would follow some losse, if any other factione should stand for the crowne. But what factione maye that bee? With what eyther right or power shall it be supported? But, goe to, suppose, for the tyme, that I wer inclinable to your desire, that I would consent to this declaratione, doe you thinke that I would doe this to satisfy the pleasure of the Lordes rather then to gratify ther Queene herselfe? Many other respects doe strongly withdraw mee. Firat, for that I am not ignorant how dangerous it is to blow these coales. I have had good reasons (mee thinke) alwayes to forbear to move disputatione and doubts concerning this matter. The controversy of marriage, allowed or voyd, the questione of issue, lawfull or unlawfull, hath bene soe often, and by soe many witts, canvased on both sydes, whilst every man favoureth one party or another,

that, for this cause, I have benee hitherto the lease forward to marriage. I was once married to this realme at my coronatione, in token whereof I weare this ring; howsoever thinges stand, I will be Queene of England soe long as I live; after my death lett them succede to whom in right it shall apperteyne. If that be your Queene (as I know not whose should be before her), I will not be against it. I will be noe impediment unto her. If ther be any law against her title, I am ignorant thereof. But this I know, that in successions of kingdomes, the fundamentall law of the crowne of the realme, the immutable law of nature and of nations (which proceedeth by propinquity of bloude) is more regarded then eyther secrett implicationes or expresse cautiones of positive lawes. For that you assume, in the second place, that, upon this declaratione, the freindship would be more firme betwene us, I feare you are deceived: I feare it would be rather an originall of hatred. It is naturall, indeede, for parentes to favour the successions of ther children, to be carefull for it, to provide for it, to assure it by all meanes unto them, because nature is of force to extinguish both the cause and the care of other respectes. But, in more distant degrees, it is almost peculiar to kings to be jealous of those whose are in next expectatione to succede. Yea, Charles the vij<sup>th</sup>, king of France, how was he affected to Lewes the xj<sup>th</sup>? Agayne, how was Lewes affected towards Charles the eight? or how was Francis of late towards Henry the second? Is it like, then, that I shall beare any better affectione towards one that is noe neerer in kindred to mee then your Queene, when shee shalbe once declared myne heyre? Is it like that I shall be well pleased in regard of her, with continuall vew of myne owne herse? Add hereto, that which I esteeme of greatest moment, I am well acquainted with the nature of this people; I know how easily they dislike the present state of affayres; I know what nimble eyes they beare to the next succession; I know it to be naturall that more (as the saying is) doe adore the the rising then the falling sunne. To omit other examples, I have learned this by experience of myne owne tymes. When my sister Mary was Queene, what prayeres were made by many to see mee placed in her seate; with what earnest desire wer they carryed for my advancement. I am not ignorant with what dangers men would have adventured the event of their counsayles, if my will had benee applyable to ther desires. Now, happily, the same men are not of the same mynd. But, as children, which, dreaming that apples are given them, whilst they sleepe are exceeding glad, but waking and finding themselves deceived of ther hope they fall to crying: soe some of them, who did highly favour mee when I was called Elizabeth, whose, if I did cast a kind countenance upon them, did forthwith conceive that, soe soone as I should attayne the crowne, they should be rewarded rather according to their desires then ther desertes; now, finding ther happ not answerable to ther hope (because noe prince is able to fill the insatiable gulfe of meues desires), they would happily be content with another change, upon possibility thereby to better ther state. Now then, if the affectiones of our people grow saynt, if ther myndes change upon bearing a moderate hand in distributions of rewardes and giftes, or upon some other cause more light, what maye we looke for when evill-mynded men shall have a forreine prince appoynted the certayne successor to the crowne, to whom they maye carry

all their complayntes? In how greates danger shall I bee (doe you thinke) when a prince so powerful, soe neere unto mee, shall be declared my successor? to whom soe much strength as I shall add by confirming her succession, soe much security shall I detract from my selfe. Neyther can the danger be avoyded by any assurances and bandes of law, for that princes, in hope of a kingdome, will not easily conteyne themselves within the limits of any lawe. Assuredly, if my successour wer knowne to the world, I should never esteeme my state to be safe." With these speeches was that meeting spent. A few dayes after the Embassadour desired to know the Queene's pleasure, whether shee would returne any farther answers to the letteres of the Scottish nobility. 'For the present' (sayd the Queene), 'I have noe other thing to saye, but that I commend both ther love and ther care towards their Queene, for this is a matter of such conditione, that I cannot eyther sodaynely or fully answer unto it. But, when your Queene hath performed that where to shee hath bound her selfe, in confirming the league, then will it be seasonable to make triall of my affectione towards her. In the mean tyme, I am of opinion that I cannot gratify her herein without some diminutions of myne honour."

We have now done enough to illustrate this volume, and take our leave with its Conclusion, — a characteristic example of the superstitions of the age:—

"Thus, while great matters were acted abroad, nothing of any moment either happened or was observed at home; onlie certaine prodigies are reported to have befallen this year, which men do commonlie regard in prosperitie to litle, and in adversitie to much. In March, a mare brought forth a foal with one bodie and two heads: also, a sowe farrowed a pigge having hands and fingers like a man child. In Aprill, a sowe farrowed a pigge with two bodies, eight legges, and but one head. Many calves and lambes were monstrous, having collars of skinnie growing about their necks, like the double ruffes that then were in use. In May, a man child was borne in Chichester, the head, armes, and legges like an anatomy, without any flesh; the brest and belly monstrous bigge; a long string hanging from the navell; about the neck grewe a collar of flesh and skinnie, pleighted and fouled like a double ruffe, and rising up unto the eares, as if nature would upbraide our pride in artificiall braverie, by producing monsters in the same attires."

*Kemps Nine Daies Wonder: performed in a Daunce from London to Norwich. With an Introduction and Notes.* By the Rev. Alexander Dyce. Printed for the Camden Society. Pp. 61. London, 1840.

*Ecclesiastical Documents: viz. 1. A Brief History of the Bishoprick of Somerset, from its Foundation to the Year 1174. 2. Charters from the Library of Dr. Cox Macro.* Now first published. By the Rev. Joseph Hunter, F.S.A. The same. Pp. 100. London, 1840.

THE Camden Society is, indeed, fulfilling its prospective pledge in a gallant style. To the foregoing close of a review of a volume of much interest, we have now to annex a notice, more brief, of two other publications which (with another before May) will complete a year's contribution to our national literature of a very novel and acceptable character.

*Kemps Nine Daies Wonder* is, as Gifford declared it to be, a rude and a curious picture

of the manners of the age; and throws much light upon the dramatic profession, of which he was a member, and a contemporary of Shakspeare:—

"William Kemp," the introduction tells us, "was a comic actor of high reputation. Like Tarlton, whom he succeeded 'as wel in the favour of her Maiesty as in the opinion and good thoughts of the generall audience,' he usually played the clown, and was greatly applauded for his buffoonery, his extemporal wit, and his performance of the jig."

"When 'Romeo and Juliet,' and 'Much Ado about Nothing,' were originally brought upon the stage, Kemp acted Peter and Dogberry;† and it has been supposed that in other plays of Shakspeare,—in 'The Two Gentlemen of Verona,' 'As you Like it,' 'Hamlet,' 'The Second Part of Henry the Fourth,' and 'The Merchant of Venice,' he performed Launce, Touchstone, the Gravedigger, Justice Shallow, and Launcelot. On the first production of Ben Jonson's 'Every Man in his Humour,' a character‡ was assigned to him; and there is good reason to believe that in 'Every Man out of his Humour,' by the same dramatist, he represented Carlo Buffone. In 1599, Kemp attracted much attention by dancing the morris from London to Norwich; and as well to refute the lying ballads put forth concerning this exploit, as to testify his gratitude for the favours he had received during his 'gambols,'§ he published in the following year the curious pamphlet which is now reprinted."

\* "During the earlier period of the English stage, after the play was concluded, the audience were commonly entertained by a jig. As no piece of that kind is extant, we are unable to ascertain its nature with precision; but it appears to have been a ludicrous metrical composition, either spoken or sung by the clown, and occasionally accompanied by dancing and playing on the pipe and tabor. More persons than one were sometimes employed in a jig; and there is reason to believe that the performance was of considerable length, occupying even the space of an hour. The following entries are given verbatim from the Stationers' Books:—

- 28 December [1591]  
 \* Thomas Gosson Entred for his copie vnder thande of M<sup>r</sup> Watkins, the Thirde and last parte of Kempes Ilgges, soe yt apperteyne not to anie other. } vi<sup>d</sup>.  
 \* die Mail [1595]  
 \* William Blackwall Entred for his copie vnder M<sup>r</sup> warden Binges hand, a ballad, of M<sup>r</sup> Kempes Newe Jigges of the Kitchen stuffe woman. } vi<sup>d</sup>.  
 \* 21 October [1595]  
 \* Tho. Gosson Entred for his copie vnder thande of the Wardens, a Ballad called Kemps J newe Jygge betwixt a scouldier and a Miser and Sym the clown. } vi<sup>d</sup>.

These entries are quoted (imperfectly) by several antiquarian writers who have enumerated the comedian's 'works'; but his own express declaration, which has already removed the 'Dvtilful Invetive' from the list, can only be evaded, in the present case, by weakly arguing, that he did not consider a jig as a pamphlet, or that the preceding entries relate to pieces which had been conveyed to the printer without his permission. My belief is that the jig in question was composed by regular dramatists, and that they were called 'Kemps' merely because he had rendered them popular by his acting, and probably by flashes of extemporal wit. He tells us that he had 'spent his life in mad Jigges'; and to one of those many entertainments Marston alludes in 'The Scovрге of Villanie, 1599:—

'Praise but Orchestra and the skipping Art,  
 You shall commaund him; faith, you haue his hart  
 Even capring in your fist. A hall, a hall,  
 Rosome for the spheres! the orbis celestiall  
 Will daunce Kemps Jigge.'

I may also remark, that, if Kempe had been a practised jig-maker, he would hardly have required the assistance of a friend to furnish him with verses for the 'Nine Daies Wonder.'

† "In the second 4to. of the former play, 1599, and in the only 4to. of the latter, 1600, 'Kemp' is prefixed to some speeches of Peter and Dogberry."

‡ "What character is uncertain: see the names of 'The principall Comedians' at the end of the play in B. Jonson's 'Works,' 1616, fol.  
 § "See pp. 1, 2, 19."

The dance, which is prefaced by a woodcut of Kemp in his morris gear of cap and bells, &c. and his taborer piping and drumming before him, is minutely described in the narrative. Every stage he danced, by what numbers accompanied, by whom and how he was entertained; with the various incidents which befell him on this singular expedition, are all set out as in the most orderly diaries of tourists and travellers. From this it appears that crowds of thousands attended him from London to Bow, Ilford, and Romford; that he was elsewhere, in populous neighbourhoods, met and accompanied by the people in masses; that like aeronauts in our day, he was welcomed by men of worship and estate, feasted by mayors and corporations, and, what aeronauts have not, was often handsomely rewarded for the entertainment his frolic afforded.

He set out on the first Monday in Lent from the lord-mayor's of London; and danced with rapid motion all the way to Norwich; so rapid indeed, that good pedestrians could not long keep up with him, and as for whirling dervise companions, when any offered, he speedily danced them to a stand-still with fatigue and exertion. Of this the examples are so humorous that we shall extract them as specimens of the book, but we must first copy a paragraph illustrative of the customs of the time:—

"The multitudes were so great at my coming to Burntwood, that I had much a doe (though I made many entreaties and staies) to get passage to my Inne. In this towne two Cut-purses were taken, that with other two of their companions followed me fram Lodon (as many better disposed persons did): but these two dy-doppers gaue out when they were apprehended, that they had laid wagers and betted about my iourney; wherupon the Officers bringing them to my Inne, I iustly denyed their acquaintance, sauing that I remembered one of them to be a noted Cut-purse, such a one as we tye to a poast on our stage, for all people to wonder at, when at a play they are taken pilfring. This fellow, and his half-brother, being found with the deed, were sent to Iayle: their other two consorts had the charity of the towne, and after a dance of Trenchmore at the whipping crosse, they were sent backe to London, where I am afraide there are too many of their occupation. To bee short, I thought my selfe well rid of foure such followers, and I wish hartly that the whole world were cleer of such companions."

Now for the morris companions:—  
 "At Chelmsford, a Mayde not passing foure-teen years of age, dwelling with one Sudley, my kinde friend, made request to her Master and Dame that she might daunce the Morrice with me in a great large roome. They being intreated, I was some wonne to fit her with bels; besides she would haue the olde fashion, with napking on her armes; and to our iumps we fell. A whole houre she held out; but then being ready to lye downe I left her off; but thus much in her praise, I would haue challenged the strongest man in Chelmsford, and amongst many I thinke few would haue done so much."

"In this towne of Sudbury there came a luty, tall fellow, a butcher by his profession, that would in a Morrice keepe mee company to Bury: I being glad of his friendly offer, gaue him thanks, and forward wee did set; but ere wee had mesur'd halfe a mile of our way, he gaue me ouer in the plain field, protesting, that if he might get a 100 pound, he would not hold out with me; for indeed my pace in

dauncing is not ordinary. As he and I were parting, a lusty Country lasse being among the people, cald him faint hearted lout, saying, 'If I had begun to daunce, I would have held out one myle though it had cost my life.' At which wordes many laughed. 'Nay,' saith she, 'If the Dauncer will lend me a leash of his belles, Ile venter to treade one myle with him my selfe.' I looke vpon her, saw mirth in her eyes, heard holdnes in her words, and beheld her ready to tucke vp her russet petticoate; I fitted her with bels, which [a] she merrily taking, garnisht her thicke short legs, and with a smoothe brow had the Taber begin. The Drum stricke; forward marcht I with my merry Maydeman, who shooke her fat sides, and footed it merrily to Melford, being a long myle. There parting with her, I gaue her (besides her skinfull of drinke) an English crowne to buy more drinke; for, good wench, she was in a pittious heate: my kindness she requited with dropping some dozen of short courtesies, and bidding God blesse the Dauncer. I had her adieu; and to giue her her due, she had a good eare, daunst truly, and wee parted friendly. But ere I part with her, a good fellow, my friend, hauin writ an odde Rime of her, I will make bolde to set it downe:—

'A Country Lasse, browne as a berry,  
Blith of blee, in heart as merry,  
Cheekes well fed, and sides well larded,  
Every bone with fat flesh guarded,  
Meeting merry Kemp by chance,  
Was Marrian in his Morrice daunce.  
Her stumpe legs with bels were garnisht  
Her browne browes with sweating varnish[t];  
Her browne hips, when she was lag  
To win her ground went swig a swag;  
Which to see all that came after  
Were replenate with mirthfull laughter.  
Yet she thumpte it on her way  
With a sporty hey de gay;  
At a mile her daunce she ended,  
Kindly palde and well commended."

The following is descriptive of the common course:—

"Besides the deep way, I was much hindered by the desire people had to see me. For euen as our Shop-keepers will hayle and pulle a man with 'Lack ye? what do you lack, Gentlemen?' 'My ware is best,' cries one, 'Mine best in England,' says another, 'Heere shall you haue choyse,' saith the third; so was the dyuers voyces of the young men and Maydens, which I should meete at euerie myles ende, thronging by twentie, and sometime fortie, yea, hundreths in a companie; one crying, 'The fayrest was thorow their Village,' another, 'This is the nearest and fayrest way, when you haue past but a myle and a halfe,' an other sort crie, 'Turne on the left hand,' some, 'On the right hand;' that I was so amazed I knewe not sometime which way I might best take; but, haphazard, the people still accompanying me, wherewith I was much comforted, though the wayes were badde; but as I said before at last I ouertooke it."

It seems that considerable sums of money depended on the performance of the exploit; and Kemp complains that some of it came but slowly in. We must, however, take our leave of him and his labor, to say a few words to the pulpit drum ecclesiastic, the documents relative to the bishoprick of Somerset: in our next.

#### MISCELLANEOUS.

*The Animal Kingdom, &c.*, by Baron Cuvier. Part IV. (London, Orr and Co.)—Cuvier's *Animal Kingdom* will ever be a work of the highest value among the standards in natural history. His system has been received by naturalists, by every portion of the civilised world, and must continue to be a fountain of knowledge of the ani-

mal creation, so long as men shall direct their inquiries to this most interesting branch of science. Taken from the latest French edition, and brought down to the present state of information by such men as E. Blyth, R. Mudge, Dr. George Johnston, and J. O. Westwood, in the several departments of mammalia, fishes, mollusca, and crustacea and insects, this publication must meet with every encouragement from a discerning public.

*Bentley's Standard Novels, Vol. LXXVIII.: The Vicar of Wrexhill*, by Mrs. Trollope. With a good characteristic frontispiece and vignette by Herveu, *The Vicar of Wrexhill*, certainly not one of the least clever and popular of Mrs. Trollope's productions, is likely to become still more generally prized in its new form. It is well deserving of its place in this successful collection.

*Juvenile Historical Library*, by Miss Corner. Part III. *Spain and Portugal*. (London, Dean and Munday.)—The early and distracted history of the Peninsula, with its Gothic and Moorish conquerors and its kingdoms in every province, offered less tractable materials for a concise Juvenile history than the annals of France in the two preceding parts. Nevertheless, Miss Corner has contrived to cram a brief outline notice of them, down to the time of Philip the Second, into these ninety-five pages; though not, we think, so carefully as in the parts which we have mentioned. In writing for the young, words should be well weighed; and in this light we object to such events as the sanguinary conquests of Cortes and Pizarro being designated as "extremely entertaining adventures," p. 92.

*Narrative of a Voyage to Java, China, and the Great Loo-Choo Island*, by Captain Basil Hall, R.N. F.R.S. Pp. 81. Double-cols. (London, Moxon.)—One of the most entertaining relations of a visit to regions of more than common interest, and attended by adventures to awaken the most lively curiosity; we rejoice to see this work reappear in the cheap form of a half-crown publication. If well received on its first issue, how much more does it merit attention now, when occurrences of such national importance attach new and enlarged views to every point connected with, and illustrated by, this voyage.

*Colonial Magazine*. No. III. (London, Fisher and Co.)—We are glad to see Mr. Montgomery Martin proceeding with this periodical in a manner to realise our expectation. The pains he bestows upon it, and the extent of useful information it contains, are most meritorious.

*A Practical Exposition of the Church Catechism, &c.*, by Mrs. Cuthbert. Pp. 132. (London, Rivingtons.)—In the form of simple lectures addressed to young people, and well suited to their capacities.

*The Christian's Latin Companion*, &c. Pp. 92. (London, Souter.)—Thomas a Kempis' "Imitation of Christ" done into Latin by Seb. Castello, with some hymns and a vocabulary.

*Tales about Peperry*. No. I. (London, Sherwood and Co.)—One of the productions to which the polemical spirit of our day gives rise. It revives many of the heavy and bitter charges with which the proceedings of the Church of Rome have been loaded from time to time.

*The Analyst: A Collection of Miscellaneous Papers*. Pp. 174. (London and New York, Wiley and Putnam.)—A pleasant collection of short papers on a great variety of subjects, and a nice little book for desultory reading.

*A Summary of the History of England*. Translated from the French of Felix Bodin, by J. Duncun, Esq. B.A. Pp. 198. (London, Rickerby.)—Bodin has been called the Sallust of France, and this little volume well deserved translation. He goes to first principles, and few works of the kind better deserve the study of youth.

*A Remedy for the Distresses of the Nation, &c.*, by the Rev. Thomas Farr, author of "A Traveller's Reminiscences of the War in Spain." Pp. 90. (London, Ridgway.)—Mr. Farr advocates a direct property-tax on all capital, except money, in the public funds; and the removal of indirect taxation which affects the poor. He holds that the corn-laws cause a loss of 50,000,000. a-year to the country, and if they continue will cause a revolution; whereas, if they are repealed, there will be an increased revenue of 5,000,000. per annum levied on foreigners; interest of money decreased to 3 per cent, and the value of land increased 20 per cent. To these glorious prospects is added a plan by which half the custom and excise duties, and half the assessed taxes, amounting to 36,000,000. may be taken off, and another surplus of 4,000,000. left at the disposal of government!!! "This a consummation devoutly to be wished!" and oh, that we could see this golden age restored! *Reclutet Saturnia regna.*

*A Winter in the West Indies and Florida*, by an Invalid. Pp. 190. (London and New York, Wiley and Putnam.)—The author starts with the startling fact, that about one-fourth of the deaths in the United States is caused by diseases of the lungs, which cut off the best of the youth of the land with premature and awful fatality. Being one of the sufferers, he sought for restoration to health in the West Indies and Florida; and the result of his experience is, that many of the West India islands are favourable towards cure, and that there is only one spot in America which in any degree possesses the qualities of climate advantageous for the invalid.

*The Naturalist's Library, Vol. VI. Entomology, Bee*, by Sir W. Jardine, Bart. F.R.S.E. & C. (Edinburgh, Lizars; London, Highley; Dublin, Curry, Jun.)—This is a charming volume, with a portrait and memoir of the celebrated Huber. There are no fewer than six-and-thirty plates coloured from nature; in which truth and beauty struggle for pre-eminence. The subject, we need not say, is one of much domestic as well as scientific interest, and it is treated with the author's usual ability.

Among a number of publications called forth by her majesty's marriage we may notice, *Precedency of H.R.H. Prince Albert, King Consort de France*. Pp. 28. (London, Mottingham.)—In which the writer tries to make out that the prince is a king of England, if the queen please to make him so.—*The Royal Marriage*, by the Rev. E. T. Gregory, M.A. LL.D.—*A Sermon Preached at Liverpool, and Addressed to the Deluded and Disaffected*. Pp. 31. (London, Ridgway.)—*Victoria and her People; or, the Covenant. A Poem*. Pp. 28. (London, Saunders and Otley.)—A very loyal and warm effusion.

*Is there a God?* A Lecture delivered in the Mechanics' Institution, Southampton Buildings, Jan. 27, 1840, by the Rev. R. Ainalie. Pp. 50. (London, Seeleys.)—A well-timed and able discourse, in which the doctrines of Socialism are exposed in their true light.

*History of Renard the Fox*. Adapted from the German of Goethe; illustrated with numerous Engravings designed by J. J. Grandville. Pp. 168. (London, Thomas; Tegg; Simpkin and Marshall.)—We are well pleased to see again a good old-fashioned child's book (really one of the pretty gilt-bound little twopenny or threepenny tales would delight us, were it just to vary the utilitarian publications, which we also like extremely in their way, but the adage remains, "all work and no play makes Jack a dull boy")—after so long a parenthesis, we have only to add, that *Renard* is cleverly depicted in this small tome in many shapes of his cruel and cunning character.

#### ARTS AND SCIENCES.

##### THE BRITISH ASSOCIATION.

THE "Glasgow Herald" furnishes us with the subjoined intelligence relating to the approaching meeting of the British Association in that city; and it affords us pleasure to be able to confirm the statement that, if her health permits, it is the intention of the Marchioness of Breadalbane to attend on the occasion. The presence of a lady so accomplished and so estimable in every point of view would contribute much to give *éclat* to that assembly over which her noble husband has been elected to preside; and where the literature of Scotland is gathered together, a descendant of the house of Baillie must always be considered as one of its most becoming and appropriate ornaments.

The preliminary arrangements for the meeting are now nearly completed, and in no city yet visited have the preparations been more complete. The zeal and business-habits of the gentlemen who form the various Committees are a sufficient guarantee, that what has been begun so well will be prosecuted with vigour, and prove creditable to the city. The Noble Marquess, the President, has been in correspondence with the Lord Provost, and, as an earnest, has ordered his name to be enrolled as a subscriber to the local fund in the munificent sum of 400*l*. The ladies of Glasgow and the neighbourhood will be highly gratified by the fact that the Marchioness of Breadalbane intends accompanying the Marquess; and her ladyship's presence will highly contribute to the enlivening the time which can be spared from the grave and select discussions, which constitute the primary object of the meetings. The Sectional Meetings can all be comfortably accommodated in the halls and class-rooms of the College. The Geological Section, being by far the most numerous, will hold its meetings in the Public Hall, which is capable of accommodating 1400. The Mineral Museum now being formed for the special, though not exclusive, use of this Section, will be exhibited in the Library Hall, which is close by the Common Hall. The New Theatre and the Royal Exchange have been secured for the evening meetings: in either of which places upwards of 3000 can be comfortably accommodated. The Committee on Minerals found in the West of Scotland are engaged, in concurrence with a general and strong recommendation of the Association, in collecting documents and specimens, and constructing charts, &c., on a plan so comprehensive, that there is no reason to doubt their being able to exhibit in their museum a complete picture of the geological formation of this district. They include in their plan collections of simple minerals and the fossil flora; and of course the remarkable phenomena of Arran will occupy their especial attention. The Model Committee have appointed, after obtaining consent of the parties, corresponding members in forty-one cities or towns in the three kingdoms, and have received promise of highly interesting models of machines or works of art from most of these places. The Liverpool and the Irish Steam-Packet Companies, as also the Great Canal Shipping Companies, have engaged to carry all models for the exhibition free of charge. Many of the mechanics and ingenious workmen in Glasgow and neighbourhood are engaged in preparing models of unique machines and splendid works of art; we know, also, of at least one very curious model having been ordered from France. Altogether this exhibition of mechanics and the works of art, the first of the kind in Glasgow, we doubt not will be worthy of that city, the birth-place of so many improvements, and of the greatest of machines—the steam-engine. One old-fashioned engine, worthless in itself, but which, from association, must, without doubt, command universal attention, will be placed in a prominent situation in the room, viz. the original model of the steam-engine which the immortal

Watt was repairing when the important discovery of the use of a separate condenser presented itself to his powerful and discriminating mind. Upwards of 180 eminent scientific foreigners have been invited to attend the meeting. Strangers from distant parts of Scotland, from England, and Ireland, will at least be as numerous in Glasgow as in other places. To prevent disappointment to all such, the Council have been under the necessity of limiting the number of members to be admitted from Glasgow, or within fifteen miles of it, to 1400, and have fixed the period of application from all such to be not later than 1st July next."

#### ROYAL INSTITUTION.

FRIDAY, March 13.—Mr. Grove, 'On Voltaic Reaction, or the Phenomena usually termed Polarisation.' The whole class of phenomena which come within the usual term polarisation, Mr. Grove demonstrated to result from a separation of the ions of the electrolyte by the initial current, and their reaction when the transferring power is removed. The experiments and reasonings that led him to adopt this opinion, and to choose the generic title of voltaic reaction in lieu of polarisation, which he considers grossly inaccurate, were forcibly and convincingly stated. The contemporaneous discovery by Volta, and Erman of Berlin, of the electrical effects exhibited by paper or cloth, moistened with salt and water, when removed from the contact of the terminal wires of a voltaic battery, to which it had been for some time submitted, was described to have led Ritter to the construction of his secondary piles. These, formed of alternate layers of an oxidable metal, and salt and water, of themselves, give rise to no electrical action; but when placed between the extremities of an ordinary voltaic pile, and then detached, they develop an electrical current in a reverse direction to that of the original pile. Sir H. Davy considered this to be the result of the decomposition of the layers of salt and water by the generating pile; of the conversion of the secondary into three elements, metal, acid, and alkali; and of the action of these different liquids upon the same metal. This subject, however, attracted no particular attention until revived by De la Rive, in his experiment commonly called "Polarised electrodes." They, like the secondary piles of Ritter, though unlike them in constitution, being an unoxidable metal, have no power of themselves to affect a galvanometer on being immersed in acidulated water; but acquire that power when placed in the liquid acid, after having formed for a short time the electrodes of an ordinary battery, and removed therefrom previously to the immersion. M. Becquerel, similarly to the view of Sir H. Davy, explained this to result from the decomposition of the interposed electrolyte, and to the reaction of the proximate elements of a salt, if such be present, or of the ultimate elements of water when that liquid alone can be acted upon. Professor Schönbein confirmed the views of M. Becquerel. He found that a positive electrode lost its power of producing a secondary current by being exposed to an atmosphere of hydrogen; and that, *vice versa*, a negative electrode lost its peculiar state by being exposed to chlorine or oxygen. And Mr. Grove, to crown the whole, by superadding the effect of polarised electrodes to the tendency of oxygen and hydrogen to combine, succeeded in the actual composition of water by a slow voltaic current. This beautiful result of an extensive series of experiments, together with the consideration of those of Mr. Faraday on electro-dynamic induction, which shew that even in the more perfect conductors—metal, a somewhat analogous but instantaneous reaction takes place, induced Mr. Grove to believe that in all these electrical phenomena action is

invariably followed by reaction; hence the adoption of the generic title "Voltaic Reaction" to the exclusion of polarisation, which tends only to confuse and mislead. Mr. Grove then proceeded to shew the application of these principles to the practical voltaic battery, and to explain the experiments which conducted him to the combination which his original and enormously powerful batteries exhibit, and which induction from those principles led him to expect. We may here remark that, throughout, illustrative experiments and diagrams most satisfactorily supported and proved the opinions expressed. For instance, to shew that by increasing the affinity in the cell nearest the zinc, which Mr. Grove conceived ought to be regarded as the generating cell, and lessening it in that nearest the copper, the decomposing cell, the power of voltaic combinations might be increased to an indefinite extent; a solution of sulphate of copper, and of sulphuric acid, were respectively poured into a glass divided by a porous diaphragm: in the solutions two plates of copper were immersed. They developed a very trifling electric action, because the affinity of oxygen and sulphuric acid for copper in the one cell is not able to conquer a similar affinity in the other; but when for sulphuric, muriatic acid was substituted, a most marked effect was produced, the affinity of chlorine for copper easily overcoming that of oxygen, and the copper on the negative side being reduced. A similar lucid explanation of the electrical principles developed in the phenomenon of gold being attacked by a mixture of nitric and hydrochloric acids, was given; the case with which nitric acid parted with its oxygen enabling the chlorine to quit the hydrogen and attack the gold. When these two acids are separated by a diaphragm of pipe-clay and zinc, substituted for gold, in the one cell, the affinity is greatly increased; and hence the great increase of power attained. For gold, however, platina is employed, because more durable and less expensive. The battery of Mr. Grove is formed, then, of pairs of zinc and platina plates, the zinc being amalgamated and immersed in a solution of either muriatic or sulphuric acid (the latter is found best in practice, though a fraction less powerful), and the platina being immersed in concentrated nitric acid, to which a little dilute sulphuric should be added to improve its conducting power. Before, however, proceeding to describe the extraordinary effects produced by these combinations, we must shortly relate Mr. Grove's explanation of the anomaly presented by amalgamated zinc. He says the molecules of heterogeneous metals, with which common zinc is adulterated, form voltaic combinations with the particles of zinc; but in amalgamated zinc these molecules are covered with mercury to which the tations of the electrolyte are transferred, rendering it equally positive with the zinc, and, consequently, causing all action to cease. Now, we come to the remarkable power these batteries exhibit, which will, judging by the effect produced on the numerous and scientific assemblage on Friday evening, surprise the most experienced electrician. With four Wollaston porcelain troughs of ten cells, water was decomposed and its constituent gases liberated at the rate of 110 cubic inches per minute! a sheet of platinum, one inch wide and a foot long, was ignited; and a bar of iron, one-sixth of an inch thick, was heated to fusion. In this battery the whole extent of platina-foil was four square feet, and it was arranged as a series of five plates. With another arrangement, consisting of fifty small plates of two inches by four, an

arc of flame, of an inch and a quarter long, was produced by charcoal points; bars of various metals were instantly burned, dropping down in large globules; and the blade of a pruning-knife, which Faraday would submit to the test, was consumed to the handle in an instant. Various other brilliant experiments were exhibited with these batteries, constructed by Mr. Watkins, of Charing Cross, much to the admiration of the spectators although to the injury of their eyes. It must be gratifying to Mr. Grove to find from the testimony of Mr. Pattison, who recently visited St. Petersburg, and to whom M. Jacobi unhesitatingly acknowledged the fact, that the extraordinary effects of decomposition and magnetic action produced by M. Jacobi, and published in a letter addressed some time ago to Mr. Faraday by him, were due to the powers of "Grove's Batteries." M. Jacobi must have derived the knowledge of these combinations from the "Comptes Rendus" of the French Institute, in which Mr. Grove's experiments were first published. Mr. Pattison has seen a boat navigated on the Neva with forty-eight of these combinations at the rate of two miles and a half an hour.

#### LINNEAN SOCIETY.

MR. FORSTER in the chair.—Exhibited, a specimen of the Jaffna moss (*Gigartina liekeoides*), used in pulmonary complaints, from Ceylon, presented by Dr. Farre; also a curious specimen of the *Septia Sepiola*, found among some shrimps at Boulogne, presented by Dr. Derbishire.—Congratulatory addresses to her Majesty and Prince Albert, on their nuptials, were read from the chair, and unanimously adopted for presentation by the meeting.—Read, a paper 'On the Existence of Spiral Cells in the Seeds of *Acanthodium spicatum*, and other *Acanthaceae*,' by Mr. Kippist, communicated by Professor Don. The chief part of the paper relates to the seed of *Acanthodium spicatum*, brought from the interior of Africa by Mr. Holroyd. The seeds of several *Polemoniaceae*, and some other plants, are furnished with appendages in many respects analogous; but the great peculiarity of the seed in the plant is, that instead of the cells being solitary, as in other cases, they are collected into clusters. These cells are closely pressed on the surface of the dry seed, to which they adhere; on the seed being placed in water the cells expand, and present the appearance of elongated spiral vessels. The author enumerates other species of the same natural family, in which similar hygroscopic processes occur. Those which more nearly resemble the *Acanthodium* are two Indian species of *Blepharis*.—Read, likewise, conclusion of a paper by Mr. Miers, 'On some new Brazilian Plants allied to the Natural Order *Burmanniaceae*.' We referred to this valuable paper in our last report.

#### ELECTRICAL SOCIETY.

MARCH 3d.—Read, a paper by Mr. Pollock, 'On the Application of Dr. Black's Law of Capacity for Heat to the Explanation of Electrical Phenomena.' In a former paper, Mr. Pollock endeavoured to shew that the cold resulting during the experiments made with the incomplete battery was in the most strict accordance with Dr. Black's law of capacity for heat. In the present one he has followed out the same view in a more general manner, in the firm persuasion that, by tracing the operation of that law in all electrical phenomena, the difficulties attending all electrical theories hitherto formed will be removed. He

has applied the law to the explanation of phenomena not generally considered electrical, and also of some electrical phenomena. Among the former were—1st. The sensation of cold or heat produced by oil of peppermint on the tongue, accordingly as the mouth be open or shut. In the former case, the oil evaporates; expansion, increase of capacity, and cold, result. In the latter, evaporation is prevented. 2d. The capability of the human body to bear a variation of temperature of more than 300°, owing to the great capacity of the perspiration for heat. 3d. The greater power of the photogenic and Daguerreotype action in the forenoon than afterwards, depending upon the latent heat in the matter acted upon being put in motion by the action of light; in the latter part of the day, the heating power of light increasing interferes with its influence to disturb the latent heat already existing in the matter. 4th. The experiment of Sir David Brewster, rendering black by heat nitrous acid gas: the interference of the undulations, the destruction of light, and the rapid cooling of hot iron when plunged into this gas, being attributable to the increase of capacity by the resolution, which heat effects, of one atom of matter equal to ninety-two into two atoms whose quantity of matter is equal to forty-six each. Among the latter, or among some of the electrical phenomena as stated above, were instanced, 1st. Humboldt's observation of the extraordinary oscillatory motions of the magnetic needle before sunrise, which he attributed to what he termed magnetic storms, supposing that the assumed magnetic fluid, existing in the earth was at that particular time put into a state of disturbance. Mr. Pollock remarks, that, according to Dr. Black's law, the expansion of the earth's surface and the conversion of water into vapour by the first action of the sun produce an increase of capacity for heat, which will be abstracted from parts even at a distance where the sun has as yet no direct influence. Thus, the greatest cold during the twenty-four hours occurs just before sunrise, and then the equilibrium of the latent heat in the earth is likely the most to be disturbed. From the coincidence of the disturbance of the magnetic needle, and the latent heat at one and the same period, Mr. Pollock infers the identity of what is termed the magnetic fluid, and latent heat. 2d. The conversion of a needle to a magnet, as stated by Mrs. Somerville, by exposing half of it to the action of the violet rays. This is also consequent upon the disturbance of the equilibrium of the latent heat of the body. 3d. The capability of unsymmetrical crystals to become electrical when heated, because of their unequal expansion; and again, the disturbance of their latent heat, which will be deficient where the greater, and in excess where the lesser, expansion occurs. Their electrical relative states are negative for the former, and positive for the latter. During the cooling of the crystal, the distribution of its latent heat and its electrical state become reversed. This was pointed out as a very remarkable case in support of "Identity." 4. The greater power of voltaic action, as shewn by Mr. Cross, in the fore part of the day, until about one o'clock. Mr. Pollock says, that in the same ratio as the heating power of the sun increases, so will his power of disturbing the equilibrium of the earth's latent heat be diminished; and hence the decrease of the electric state of the earth during the latter part of the day. The diminished power as above is the consequence of the sun communicating more heat, and thus

satisfying the increase of capacity created by the expansion of the earth's surface and atmosphere. In conclusion, Mr. Pollock observed, that in the further pursuance of this investigation it appears highly desirable to apply Dr. Black's law to the subjects—insulation, induction, and conduction, which will still further shew the connexion between the latent heat of bodies and their assumed electric fluid.—Read, also, a letter from Mr. Mason, 'On the Production of Casts of Medals by Voltaic Precipitation,' relating his experience in this matter; but want of space precludes comment.

Tuesday, 17th.—Read, a communication from Mr. Andrew Cross, of Broomfield, detailing 'Experiments with a Water Battery.' The statistics of water batteries, which this paper contains, are exceedingly valuable, and the experience and experiments of Mr. Cross, with series extending from three to nearly two thousand pairs of cylinders, highly important and interesting. He works on a grand scale, and wisely endeavours to imitate nature as closely as possible. We are prevented this week, by press of matter, from laying the details before our readers. We, however, do not regret this so much, because it will shortly be published at length in the forthcoming Journal of the Society.—Read, also, a note from Mr. Mackrel, 'On an Economical Battery.' It is a modification of the Wollaston Battery, with paper bags to contain the zinc. It is simple and cheap, and economises the solutions.

#### STATISTICAL SOCIETY.

LORD SANDON in the chair.—The first paper read was a report prepared by a committee of the Society 'On the Moral and Physical Condition of the Working Classes in the Parishes of St. Margaret and St. John, Westminster.'—A second paper was read; it was 'On the Effect of the New Postage Arrangement in the Number of Letters,' by Rowland Hill. From an examination of a number of tables given by Mr. Hill, it appears that the number of chargeable letters of all kinds has increased 29 per cent under the fourpenny rate, and 121 per cent (on deducting the government letters, 117 per cent) under the penny rate; the greatest increase being in Scotland. And that the number of chargeable letters distributed by the general post has increased 40 per cent under the fourpenny rate; and 169 per cent (on deducting the government letters, 165 per cent) under the penny rate; the greatest increase being, as before, in Scotland. Considering that a very short time has elapsed since the reduction took place; also, that an important part of the plan, namely, the use of stamps, remaining still to be introduced; and further, that the facilities for despatching letters, instead of being increased, have, from the temporary necessity for closing the letter-boxes early, been as yet materially diminished; perhaps the increase of letters will be thought as great under the circumstances as could reasonably be expected.—At the anniversary meeting held on Monday, Viscount Sandon was elected President, and the usual reports (very satisfactory) were read.

#### PARIS LETTER.

Academy of Sciences, March 17, 1840.

SITTING of March 9.—After a note had been read from M. Binet, professor of astronomy at the Collège de France, on the secular inequalities of the elements of planetary orbits, M. Robiquet read a curious report from M. Boutigny, druggist at Evreux, on various pheno-

mena relative to the calefaction of water and other liquids. It is known that if water be allowed to fall in small drops on a hot metallic plate it does not evaporate quickly, but remains in small spherical drops as long as the plate is maintained at the same temperature. M. Boutigny had tried the same experiment with ether, and also with anhydrous sulphuric acid, dropped into small platina dishes. He found that the latter substance became much agitated at first, and then formed itself into small drops, like ether or water, remaining motionless, and having almost the appearance of becoming crystallised. On seizing the heated platina dish with a pair of pincers, and rapidly pouring these drops of liquid on to the hand, a decided sensation of cold was produced. If, however, these globules were suddenly poured into a tube, and the tube immediately corked up, the globules would disappear, but would leave a slight dew behind. He suggested that these observations, if followed up, might throw some light on the operations of water and red-hot plates in steam-boilers.

A memoir was read from M. Penzoldt, on a wheel, or drum, which was intended for drying woollen and other stuffs. The cloth being applied to the outer surface, the wheel was made to revolve about 1500 or 2000 times in a minute; and a few minutes were found sufficient to dry the cloth, or stuff, almost entirely. A current of air might be introduced into the middle of the drum to facilitate the operation.

A modification of the system of telegraphs now in use, proposed by M. Regnault, was recommended to the Academy by M. Savary: it consisted principally in keeping the man-arm always horizontal, and adding a third branch in the middle.

Several *statuettes* were placed on the table, as instances of the application of a machine invented by M. Dutcl, for cutting blocks of marble into the rough form of the figure intended to be ultimately given by the statuary. They were executed with mathematical nicety, and in the proportion of only eight days' work instead of forty-two days, which the rough cutting of a large statue sometimes required.

M. Delannoy sent a communication that the amalgam of mercury used for the Daguerreotype, instead of being made with silver might be formed with lead, or other common metals.

A memoir was read from M. Dutrochet, on the vital heat of crustaceous and molluscous animals; in which the low state of the temperature of their bodies was fully proved. That of most fishes was proved by M. Dutrochet to be equal to that of the circumambient water: in crustaceous animals he could not discover any trace of temperature proper to themselves. He had also extended his experiments to insects, and had tabularised the results: in no case had he found the temperature exceed one degree centigrade. M. Muller sent a memoir on the lymphatic hearts of tortoises, &c. and on the organisation of the pseudo-branchiae and the plexus vasculares of fish.—M. Milne Edwards wrote to the secretary the result of his observations at Nice, on the *Beroe ovalis*, proving a double system of circulation in it.

Académie Française.—Sittings of 10th and 12th of March.—M. Viennet read a long extract of his epic poem, entitled "Fernand Cortez." Several works were presented to the Academy by their respective authors. One of the most remarkable was by M. Delandine de St. Esprit, "The History of France, or the Religious Conspiracies during the Reigns of the Last of the Valois."—A report was read to the Aca-

demy upon the work of M. Tissot, professor of philosophy at Dijon, "On the Mania of Suicide, on Revolt, on their Causes, Remedies, &c."

*Académie des Sciences, Morales, et Politiques.*—M. Châteauneuf read a memoir on the production of corn in France since the end of the seventeenth century. It resulted that the quantity of land devoted to the growth of all kinds of grain was on the increase; one half of fifty-three millions of hectares being cultivable, but only eight and a half millions being laid down in wheat, rye, and other bread corn. M. Portalis read to the Academy his observations on the New Civil Code of Sardinia, and took a review of the history of all the civil codes of Europe.

The "Bibliothèque de l'Ecole des Chartes" continues its course of publication; and valuable documents are always sure to be found in it.

The first volume of "La Galerie des Contemporains Illustres, par un Homme de Rien," has just appeared; its preface consists of a flattering letter from M. de Chateaubriand.

The "Album du Salon de 1840," with a preface by Baron Taylor, Inspector-general of the Fine Arts, has been sent into the world; its first three numbers contain some admirable sketches of good pictures in the collection.

The King of Sardinia has just founded a chair of practical geometry, and another of civil architecture, design, and ornamentation, in the University of Cagliari.

The Roman Pontifical Academy of Archaeology has proposed a prize for the following subject:—"Was the money, *as grave*, not Roman, and without any epigraph, struck only by the people who dwelt between the Tiber and the Liris (Gurigliano)? Was this anterior to the fourth century of Rome? What are the inferences to be drawn from the comparison of this money with the monuments of art of other populations of Italy, or beyond sea, as to the establishing of whence these arts took their origin, and derived their progress?" This prize is open to competitors of all countries: the essays (in Italian, Latin, or French) are to be sent in *without* the name of the authors, to the Cavaliere P. E. Visconti, perpetual Secretary of the Academy, on or before 15th November, 1841.

Sciarada: "Città l'un; spiace l'altro; un fiume è il tutto."—The answer in our next.

#### NEW PUBLICATION.

*Map of China, compiled from Original Surveys and Sketches.* By James Wyld.

THIS is an excellent map, and comes in excellent time, for it was much needed; all those in use hitherto being but copies of D'Anville's, which is full of errors, having been taken from the Jesuit missionary-map of 1737, and that compiled by P. Adam Schalliger. Succeeding geographers only perpetuated their defects. Of later years Staunton, Amherst, and Basil Hall sketched the country from Canton to Peking, a small part of Chan-tong, some of the islands, and the coast of Corea. A few observations on the Korean Archipelago were also made, from the Alceste and Lion, at the same time; and nothing more was done till, in 1828, the British resident at Canton mapped part of the coast from that port to Chan-tong. Mr. Wyld's map embodies all these surveys, but is chiefly founded on a MS. chart of the East India Company's, and a private sketch, English and American, of various harbours and portions of the coast, &c. Amongst these we find the Tchuman group, which is important, as

affording the best anchorage on the Chinese coast; and Poo-too, the sacred island of the Chinese, containing about 2000 priests. Formosa and Hainan also appear to be laboriously accurate. The interior of China is taken from the native maps, translated for the purpose; and from these are also marked the vegetable, mineral, and manufacturing districts, rice-grounds, coal-mines, varnish-trees, sugar-cane plantations, silk-worm districts, &c. The western frontier, we notice, contains much novel information with respect to the extension of the Chinese empire in that quarter; the indigenous tea-country, and the mines of gold, silver, coal, and rubies; the garrisons, pine-forests, &c. The eastern coast and islands shew extraordinary care and minuteness. This map hourly becomes more interesting in our present and future relations with China; and Mr. Wyld farther announces a plan of Peking, taken some little time since, and which, if our forces are to bombard that city, may be of use to direct the engineers and artillery-men.

#### LITERARY AND LEARNED. UNIVERSITY INTELLIGENCE.

OXFORD, March 12.—The following degrees were conferred:—

*Masters of Arts.*—Rev. F. A. Bowles, W. H. Cope, Magdalen Hall; Rev. D. O. Cotes, Scholar of University College.

*Bachelor of Arts.*—J. P. Evans, Scholar of Jesus College.

#### ROYAL SOCIETY.

THE Marquess of Northampton in the chair.—A paper by Major Sabine was read. It treated of terrestrial magnetism. The first section referred to the lines of inclination and intensity, from experiments made by the author in the Atlantic Ocean. The second section referred to the lines of intensity at the Cape of Good Hope and New South Wales. Major Sabine alludes to the valuable results obtained by Lieutenant Sullivan and Mr. Dunlop of the Paramatta Observatory; and gives his own in a tabular form, observing that they ought to be considered first approximations; as such they may be useful. There was likewise, in part, read, 'Experimental Researches in Electricity, seventeenth series,' by Mr. Faraday. Our report of this valuable paper, and also of the sixteenth series, both bearing on each other, will be given when the reading shall have been concluded.

The President's second *soirée* for the season took place on Saturday, and was as brilliantly and numerously attended as the first. The fine suite of rooms was filled for several hours by distinguished men in every walk of life,—the representatives of diplomacy, rank, science, arts, and literature. Besides Mr. Liston's extraordinary microscopic preparations to shew the circulation in the most minute animal tissues, the noble Marquess exhibited a beautiful selection of photogenic drawings; and many other interesting objects varied the scene of personal and friendly intercourse, which is the great charm of such associations.

#### ROYAL ASIATIC SOCIETY.

MARCH 7th. Professor Wilson in the chair.—H. Wilkinson, Esq. said that he was about to read a paper 'On Iron,' a subject which did not appear to have much connexion with the Society's pursuits; but when he stated that India could produce a metal equal in quality to the best iron from Sweden, and at a cost, when landed in England, of 60 per cent under Swedish iron, he thought that any thing on the subject would be received with interest.

He went on to state that Mr. Heath had received some hundreds of tons of ore from India, and he expected as much more, which contained 72 per cent of pure metal; and from this ore excellent wrought-iron could be made at once. He had lately been performing some experiments on this iron, in conjunction with Mr. Heath; and had made sword-blades of the steel produced from it, which excelled any he had ever seen. Mr. Wilkinson further said, that what he was going to read would not be absolutely new, though probably it might be so to several gentlemen present. It was upon the spontaneous heating of cast-iron when brought into the air after it had been for many years under salt-water. Several instances of this action were stated; the most curious of which was that of some cannon-balls raised in June 1836, by means of the diving-apparatus, from the ship Mary Rose, which sunk in a naval engagement near the Isle of Wight, in July 1545, nearly 300 years before. These balls all became hot on exposure to the air, and fell to pieces. It was observed also, that they had all lost about 36 per cent of their weight. An iron ring from one of the guns of this ship was placed upon the table; being of wrought-iron it had not exhibited the phenomenon shewn by the cast-iron, and was merely oxidised. Mr. Wilkinson stated that the cast-iron gratings which had been long immersed in the porter-vats of the large London breweries grew hot when the porter was drawn off, and from a similar cause. He then alluded to the cast-iron protectors, which had been fixed to the copper bottoms of ships, so as to prevent their corrosion by salt-water, in pursuance of a suggestion by Sir Humphry Davy; and observed, that in this case the action of the salt-water on the iron was greatly aided by the galvanic action caused by the contact of the two metals. The iron lost half its weight in two or three years, although retaining its original form; and in one large piece which he produced the weight was reduced almost to the levity of a piece of cork; and this piece would make a mark on paper like a lump of black-lead. The cause of the action in all these cases was the minute quantity of carbonic acid gas held in solution by the water, it being taken up with the atmospheric air, which was always found to contain about one per cent of this gas. This acid was the cause of rust, which he proved by exhibiting two bottles to the meeting, one containing iron in ordinary water, the other, iron in water deprived of its carbonic acid gas. In this bottle the iron was perfectly bright, notwithstanding it had been two years immersed; while in the other bottle the metal was covered with rust. These facts gave a clue to the cause of the curious phenomenon first mentioned. It was well known to chemists, that several metals, when reduced to a very minute state of division, caught fire spontaneously by the absorption of oxygen. Cast-iron which had been long exposed to the action of salt-water was in this state: it was in fact almost all carbon; and the little metal that remained, being diffused throughout the mass, was necessarily very minutely divided; on exposure to the air, an absorption of oxygen took place, and great heat was evolved. The subject might be illustrated by enclosing tartrate of lead in a glass tube; driving off the acid at a red heat, and then hermetically sealing the tube. The inclosed substance would be a black powder, consisting of lead minutely divided, combined with a small portion of carbon. This, if well made, would keep good for months; and on

breaking the tube, would instantly take fire. Mr. Wilkinson observed, that it was difficult to hit the mark correctly in this experiment; for the least excess of heat agglutinated the lead; while, unless a certain degree was kept up, no lead would be reduced to the metallic state; and, in either case, spontaneous combustion would not follow. He had brought three or four tubes with him for exhibition, but had no great confidence that he should succeed in firing them. The tubes were broken, but the substance did not take fire: it appeared that the metal had not been sufficiently reduced. Mr. Wilkinson, therefore, applied a small addition of heat, and the powder instantly inflamed on being shaken from the tube, and brought in contact with the air.—The Director read a short note by Dr. Wilson, the President of the Bombay branch of the Society, 'On some Inscriptions found at Märab, in Arabia, and presented to the Bombay Society by Dr. Smyttan.' These inscriptions are in the same character as some discovered in the south of Arabia, an account of which had been read at a former meeting of the Society (*vide* No. 1049), and printed in their Journal. They have been named Himyaritic, and are considered to have a resemblance to the Ethiopic. Dr. Wilson's opinion, however, is, that they rather resemble the ancient Greek, as it is found in some inscriptions, particularly the Nemean inscription; the alphabet of which, taken from the treatise of Dr. Gregory Sharpe, was laid upon the table. Dr. Wilson thinks that his conjecture on this point is corroborated by the universal belief of antiquity, that the Greeks had their alphabet from the Phœnicians; and, also, that the Phœnicians were originally an Arabian colony, as was explicitly stated by Herodotus. He does not, however, insist on the justness of his opinion, but thinks that the inscriptions will be viewed with great interest by European scholars.—Mr. E. Solly read a report on the series of dyeing drugs from the Punjaub and Mysore, adverted to at the last meeting. They comprised a numerous series; but as many of them were specimens of substances already well known in commerce, it was sufficient to mention the new and unknown ones. They were as follow:—*Capilly*, a red powder obtained from the fruit of the *Rottlera tinctoria*, and which is used in India by the natives for the purpose of dyeing silk of a pale orange colour. The colour is of a resinous nature, and might, perhaps, be employed in colouring varnishes or lacquers; but as Dr. Buchanan states that it costs 1s. 3d. per pound, it would probably be too expensive for dyeing calico. *Maddi Chickha*, the bark of a species of morinda, from Mysore, and there employed for dyeing calico red. The colours which it produced were dingy, but it appeared likely to be useful for some other colours. *Poppli Chickha*, a red-dye wood, also from Mysore, containing abundance of rich, brown-red colour, which, by the action of an alkali, becomes of a fine carmine tint. It forms a good colour on calico, with tin or aluminous mordant. Dr. Buchanan describes both this and the preceding dye as being very cheap and abundant. *Maen*, or *Sakker*, a substance used in India to mix with cochineal to heighten the colour. It is a very astringent substance, containing much tannin and gallic acid. It precipitates the animal part of cochineal, and likewise acts slightly on the colour from the acid which it contains, but it does not otherwise seem to brighten the colour. It might be used advantageously as a substitute for galls, provided its price permit,

as it dyes a good black with salt of iron, and makes an excellent ink. *Hurda* and *Tarikay*, varieties of myrobalsans, the fruit of certain species of *Terminalia*, and used by the natives of India in tanning and dyeing. They contain a considerable quantity of tannin, gallic acid, and gum; and are far less known than they deserve to be in this country, though a few small parcels have come over as East India galls. *Toondewa* and *Ukulbere*, two yellow dyes, the colours of which were not particularly fine or desirable. In concluding, Mr. Solly remarked that the dyes called *Maddi* and *Poppli Chickha*, and also the *Maen*, being quite new, and seeming likely to be useful, were worthy of being submitted to manufacturers.

## SOCIETY OF ANTIQUARIES.

MR. HUDSON GURNEY, V.P. in the chair.—Mr. Rosser exhibited a facsimile by rubbing, of an engraved monumental stone in the church of Brading, Isle of Wight. This splendid stone is eight feet long by three feet and a half wide, and covered with engraving, representing a man in armour standing in a niche, elaborately ornamented with figures of saints up the sides and a canopy over the head. From part of the altar-rails coming upon the stone, the name of the person to whose memory it was placed is doubtful; but the remainder of the inscription states that he was constable of Porchester Castle, and died in 1441.—Mr. Halliwell exhibited a drawing on vellum of the volval (as we understood the word), an astronomical instrument mentioned by Chaucer, of the nature of the astrolabe; this representation consisted of several astronomical tables in concentric circles.—Mr. Stapleton communicated observations on the ancient history of Normandy, with the names of the cities and provincial divisions; being part of his introduction to the forthcoming rolls of the Norman exchequer.

## LITERARY AND SCIENTIFIC MEETINGS FOR THE ENSUING WEEK.

*Monday*.—Geographical, 9 P.M.; Medical, 8 P.M.  
*Tuesday*.—Medical and Chirurgical, 8½ P.M.; Civil Engineers, 8 P.M.; Zoological, 8½ P.M.  
*Wednesday*.—Society of Arts, 7½ P.M.; Geological, 8½ P.M.; Medico-Botanical, 8 P.M.  
*Thursday*.—Royal, 8½ P.M.; Antiquaries, 8 P.M.; Royal Society of Literature, 4 P.M.; Numismatic, 7 P.M.  
*Friday*.—Royal Institution, 8½ P.M.  
*Saturday*.—Westminster Medical, 8 P.M.

## FINE ARTS.

## SOCIETY OF BRITISH ARTISTS, IN SUFFOLK STREET.

THE annual exhibition of this Society opened to the public on Wednesday, the 18th instant. We proceed to select from its novelties some examples highly honourable to native talent; premising, however, that there are few specimens of what may be termed the elevated in art; that there is a superabundance of portraiture; and that the leading and most attractive features of the collection will be found in the landscape department. For instance,

204. *The Memmons: Sunrise*. W. Müller.—The most powerful representation we ever met with of the effulgent effect of sunlight, as seen through the shifting sands of the parched desert; while the gigantic and mysterious statues present themselves in gloomy grandeur on the vast plain. In the foreground is a solitary vulture, preying on the carcass of an animal, and contributing to the awful sublimity of the desolate scene.

113. *Passage behind the "Falling Sheet," Niagara*. D. T. Egerton.—The objects here,

too, are fearfully sublime; and Mr. Egerton has happily succeeded in conveying to the mind of the spectator a perfect idea of one of the most magnificent and wonderful phenomena of nature. We confess we would much rather gaze at the daring travellers who, amidst the deafening roar, are about to penetrate the horrid chasm between the cataract and the rock over which it is precipitated, than join the party.

120. *Scheveling Beach: Morning*. J. Wilson.—A busy scene of life and motion, exhibiting some of the highest qualities of the Flemish school, but without any thing like servile imitation.

131. *A Landscape: Evening*. 214. *Tourleville, and the Port of Cherbourg, on the Coast of Normandy*. T. C. Hoffaud.—The former, a composition much resembling the effect and manner of Claude, with a truth of nature which always distinguishes the works of this able artist; the latter, a production on which Mr. Hoffaud has poured out the full tide of his skillful execution and fidelity of representation. In aerial perspective, and in the extent of vision which it embraces, it may vie with the best performances of the celebrated master to whom we have already alluded.

But to describe in detail the various proofs of high ability in this department of art, would lead us far beyond our limits. Suffice it to say, that Messrs. Tennant, Allen, Shayer, Brandard, Childs, Crome, and Clint, have greatly distinguished themselves. The two last-named artists have contributed some admirable river-scene moonlights. In studies of cattle, T. Sidney Cooper and C. Josi are alike conspicuous for faithful character and masterly execution.

71. *The Folly of Avarice*. E. Prentiss.—The artist has invigorated his pictorial illustration of this all-absorbing passion by a well-conceived contrast between the diminutive and attenuated form of the miser, and the lofty and splendidly decorated apartment in which he is seen. Nor is the chiaroscuro less calculated to set the principal object in a powerful light. The accessories, likewise, are painted with Mr. Prentiss's usual judgment and skill.

160. *Samson and the Philistines*. B. R. Haydon.—As a composition in the more elevated class of the art, Mr. Haydon has here exhibited his well-known talents and judgment. He has also communicated to Samson the energy of character and action which the occasion naturally called forth. And although, in certain respects, the work before us may fall short of some of the artist's former productions, it must be recollected that inequalities frequently occur in the efforts of genius.

370. *Noormahal, the Light of the Harem*. A. J. Woolmer.—One of the most beautiful and perfect specimens of the imaginative in art that ever came under our observation. Its lightness, its brilliancy, its vision-like transparency, must be seen to be appreciated. The same artist has afforded another striking instance of his talents in 298, *Haidée finding Juan on the Seashore after the Wreck*.

279. — R. Dadd.—Although without a title, neither that nor the quotation from "As you like it," can be necessary to show that this tasteful and elegant composition represents one of the sprightly conversations between Rosalind and Celia.

316. *The Smugglers' Return*. T. Clater.—Such works owe much to their intrinsically picturesque character. Mr. Clater, with the careful study and powerful effect that distinguish his performances, has given to his fierce figures, and to their cavern-like habitation, all that belongs to the subject and occasion.

359. *The Monopolist*. R. W. Buss.—Although perfect in its comic character, and one of the most carefully executed of Mr. Buss's works, we cannot help being surprised at his taking up a subject which, but a short time ago, was so happily treated by one of our ablest artists. The profound selfishness of Mr. Haydon's "Newspaper Monopolist" cannot be improved upon, even though, as in the present case, he join the monopoly of the fire to that of the journal.

386. ———. A. W. Elmore.—This beautiful little picture, suggested by a passage in Prior, exhibits the taste and talents of the artist to great advantage.

398. *The Morning Bath*. Miss F. Corboux.—A charming display of the fair artist's powers, calling forth all the associations of purity and duty connected with the subject.

415. *A German Tea-Garden*; sketched from *Nature at Dresden*. T. Von Holst.—From its character and execution, we cannot for a moment doubt the fidelity of the representation; and have only to express our fears that the austere and misanthropic countenance of a figure on the left will curdle the cream of the neighbouring tea-party. It is, however, a clever performance.

[To be continued.]

#### NEW PUBLICATIONS.

##### *Portrait of Her Majesty Queen Victoria.* Colnaghi and Puckle.

THIS is one of the most exquisite specimens of lithography ever seen in this country. It is by Mr. Lane, after Ross's charming miniature, and distinguished by extreme simplicity. The playful smile on the lips, the expression of the eyes, and the delicate pencilling of the eyelashes, give the portrait a lifelike character. It is intended as a companion to the "Albert," published by Messrs. Colnaghi and Puckle sometime ago.

##### *A Visit to Fandah, in 1833.* By Commander William Allen, R.N.

THESE are two interesting lithographic drawings, by Captain Allen, of Fandah or Fundah, high up what he considers to be the principal branch\* of the Niger; and to which two excellent papers in "The United Service Journal" for November and December refer. We rather think they are for private circulation only; but however that may be, they are striking and characteristic representations of African scenery and natives. Commander William Allen, we may notice, is second in command of the expedition preparing under the gallant Captain Trotter; and the third in command of the third steamer is also a Commander Allen—Commander Bird Allen.

##### *On the Use of the Improved Papier Mâché in Furniture, in Buildings, and in Works of Art.* By Charles Frederick Bielefeld, Inventor and Sole Manufacturer.

THIS is, unquestionably, a most valuable invention. After describing its applicability (illustrated by numerous plates) to a great variety of ornamental purposes, Mr. Bielefeld observes:—

"There is no art to which the lovers of the fine arts, and especially of sculpture, are more indebted than to the art of moulding and casting in plaster; but for this art we should be almost wholly ignorant of the merits of contemporary sculptors, and the glorious efforts of

ancient art would be all but lost to the world. By means of plaster-casts the *chef-d'œuvres* [*chefs-d'œuvre*?] of all ages are multiplied and brought from the uttermost corners of the world into the museum of the connoisseur, and the studio of the professor. But how perishable and fragile is a plaster-cast! how cumbersome! how difficult of transport! Such, indeed, are the risks of breakage, that no one is willing to pay for a cast the price that would compensate for the difficulty and expenses necessarily attendant on making a perfect mould and cast. The result is, that the plaster-casts ordinarily sold are most imperfect and unsatisfactory representations of the works of art they are derived from. The new substance now under consideration presents itself to obviate all these inconveniences; for, whilst a copy of any piece of sculpture can be made in it with perfect truth and fidelity, its weight is scarcely one sixth of that of plaster, and its liability to fracture less than that of stone, marble, or wood. When these advantages, coupled with economy in price, are considered, it will be easily seen what facilities are now afforded for disseminating throughout the empire a knowledge of the best works of sculpture."

This is an excellent idea, and it would give us great pleasure to see it carried extensively into effect.

##### *The Royal Gallery of Pictures.* Part IV. Bohn.

PERHAPS the most striking plates in the present, which is the last part of this pleasing publication, are Rubens's "Portrait of his Wife," beautifully engraved in line by S. Smith; and Rembrandt's "Lady with a Fan," not less beautifully engraved in mezzotint by J. P. Quilley. Of its size and extent, we do not know a more satisfactory collection (principally) of the Dutch and Flemish schools, than is presented in the whole volume, consisting as it does of thirty-two select works.

##### *Portraits of the Earl of Chesterfield, Countess of Chesterfield, and Hon. Mrs. Anson.* By the Count D'Orsay. Mitchell.

THE present *livraison* contains the first female portraits that we have seen from Count D'Orsay's pencil, and they prove that he is as skillful in delineating beauty and elegance, as he has shewn himself in representing the more firmly marked features of his male subjects.

##### *Six Studies of Trees.* By J. C. Deeley. WELL calculated to assist the student of landscape in discriminating the characteristics of various trees, from the humble Pollard-Willow to that pride of the British forest—the Oak.

*Westmacott's Outlines of the Fights of Free-will, a Moral Allegory* (Mitchell), have, we are happy to see, already reached a second edition. Their merits well deserved it, but it is not always that the productions of merit are so promptly acknowledged.

*Bolton Abbey*.—So great has been the sale of this beautiful and magnificent print, that the publisher (Mr. Boys) has found it necessary to have it re-engraved.

#### THE DRAMA.

*Covent Garden*.—On Monday an unfortunate essay was made at this theatre with *Romeo and*

*Juliet*, which was, we regret to say, as great a failure as any to which we ever saw a play of Shakspeare's exposed. Miss Jane Mordaunt, the younger sister of Mrs. Nisbett, a very pretty girl and promising in light comic parts, was quite overwhelmed with the weight of *Juliet*. A character all of nature, with the gushing affections unchecked by a single reserve, is not to be taught or learned by rote; and we shall not add another word upon the unsuccessful *débutante* on this occasion. Mr. Anderson, in *Romeo*, seemed to partake of the general weakness, and except in nearly tumbling over the balcony with *Juliet* created no sensation in the part. Mr. Vandenhoff's *Mercutio* wanted airiness and spirit; and, in short, with the exception of the *Nurse*, very satisfactorily played by Mrs. Jones, and the unequalled *Apothecary* of Meadows, with his melancholic, wailing voice, the tragedy was altogether a sad affair.

On Thursday, Cibber's *Double Gallant* was revived here, with all the female beauty and talent of the theatre, and in the fantastic costume of the time of Queen Anne,—furbelows, paint, patches, wigs, flounces, and feathers; the beaux corresponding in equally ridiculous laced coats and cuffs, long flapped waistcoats, profuse *Ramillies'* ringlets, triangular hats, hosen, shoon and buckles, all of like coxcombical and unnatural fashion. Nothing could surpass the getting-up of the play in this respect; and where Mr. Grieve had an opportunity to introduce any of his delightful scenery, it was done greatly to the advantage of the spectacle. With regard to the comedy itself, it is one of no interest whatever; and on the average rather tedious, though the dialogue is often smart and pointed. But the satire is pointed at the manners of another age, and an age for whose manners we, of the present day, care very little. Plot there is none; but all the characters, with hardly an exception (*Clerimont*, Mr. Vining) vicious and heartless, are engaged in multiplied and involved intrigues, to accomplish their separate desires or individual seductions. To this end, the most improbable disguises are assumed and thrown off; and the *Double Gallant* (*Atall*, Mr. C. Mathews), who might, in truth, be called the quadruple, or universal gallant, goes so far as to deny his own identity, first to one lady, and then to another, both being present, and to turn out to be a third party after all. To say that the play contains some immoral scenes would be a folly, for it is one mass and tissue of immorality. The ladies, married and unmarried, seem disposed to any species of adventure or dissipation; and the gentlemen are appropriately dissolute. The sordid citizen's (*Sir Solomon Farren*) wife (*Lady Sadlife*), Mrs. Nisbett, is a decided courtesan, wanting nothing but opportunity to furnish ample cause for an action of *crim. con.*; and brought off her scrapes by the ingenuity of her kindred-minded Abigail (*Wishwell*, Mrs. Orger). The second title of the piece is, *The Rich Lady's Cure*, which is performed on the most affected and preposterous of all she-idiot's (*Lady Dainty*, Mrs. Walter Lacy) by *Careless* (Mr. G. Vandenhoff), who, being rejected in his own shape, puts on the masquerade of some mongrel prince, and so carries the lady to the priest at a single interview. *Clarinda* (Madame Vestris) converts herself into a blustering cavalier, and fights, and, by stratagem, disarms her lover; and, in short, throughout the whole, "nothing is but is not." The attractions of the play, therefore, such as they were, depended on the performance; and it is but just to say that the

\* Mr. M'Queen is of opinion that the Formosa débouché is the main river.

ladies we have mentioned, and also *Sylvia* (Mrs. Brougham), and *Situp* (Mrs. Humby), were all that the profligate dandies of the year 1707 could wish; and sorry should we be to think that such were real portraits either of our grandfathers or grandmothers. The gentlemen were hardly so "letter perfect" in their parts, or so easy in their fine clothes; but still the flashes of Farren's humour, and the gaiety of C. Mathews's effrontery, together with the effect of three or four ludicrous situations, in which Mrs. Orger and *Captain Strutt* (a Bobadil, excellently done by Selby) participated, helped greatly to redeem the tedium of the drama. But, perhaps, it owed most of all to an old-fashioned dance at the end by all the characters, which was encored—it would be difficult to decide whether most a compliment to itself, or a slur upon the play to which it was attached. The performances lasted very nearly three hours and a half!

*Haymarket*.—The Haymarket opened on Monday with a crowded house to witness *Hamlet*, with several changes in the usual cast of characters. Before we notice them, however, we ought to state that a very graceful and appropriate new drop-scene has been painted by Mr. Phillips; and that the play was got up in a manner quite superior to the dinginess of which the Haymarket has been accused, with new dresses and scenery, and other improvements, that had a very favourable effect upon the general impression of the performances. One striking introduction, which, when it comes to be better managed, must excite a strong sensation, occurs in the closet-scene, where, instead of pulling two miniatures from their bosoms, *Hamlet* finds the counterfeit resemblance of his father and uncle, to appeal to in wringing his mother's heart, upon the wall of the apartment, where their whole-length portraits are appropriately seen. The sudden entrance of the *Ghost* too, as if starting from his own picture, will be most effective, though on the first night the position of the painting, and the garb and exposed countenance of the *Ghost* (Mr. Phelps), rendered it less so to the majority of the audience than we have no doubt it will be made on repetition. And before giving up the *Ghost*, we may notice that he is not sepulchral enough, but appears to take a sort of lively natural interest in the matter as if he should like to forgive and make it up with his quondam wife. Though Macready's *Hamlet* has been for some years before the public, his representation of the part on Monday was so fine and vigorous, that we must, in justice, offer a remark or two upon it. His conception is to our minds perfect: *Hamlet* affects madness, and is often greatly excited, but never mad. This was his reading of the character, and there is an argument in favour of it, which, notwithstanding all the voluminous controversy on the question, has never, as far as we know, been urged; but which, in our opinion, is decisive. *Hamlet* never exhibits the slightest semblance of insanity except when he has other persons with him; when alone, he is not only rational and sensible, but his soliloquies are the very perfection of moral and human reasoning. This is much stronger proof than his offering his pulse to his mother to show that it temperately beats time; for the really mad are equally so in their privacy as in their publicity. Embodying, then, this idea, the whole personation was wonderfully great—especially the play-scene, and the closet-scene already alluded to, which were the highest efforts of histrionic art. The change

of seats and other points in the latter, extorted such bursts of applause as almost to mar it; but, indeed, wherever there was passion, as with *Ophelia*, *Rosencrants* and *Guildenstern*, and the finale; the judicious advice to the players was carried into practice so perfectly that the theatre was borne away with the torrent, and the triumph was as complete as ever was witnessed on the stage. We must confess that we do not think the delivery of the soliloquies so fine; it may be the tormenting cant of criticism, but some of the pauses and emphases gave a peculiarity to certain passages which had better be reformed, even altogether. Mrs. Warner's *Queen* was both a slightly and excellent performance, and in her trial-scene the interest was much increased by her able co-operation with *Hamlet*. Mr. Warde in the *King* did not seem completely restored to health, but he looked it well, and fairly got through his regal duties, such as they are. We have now to speak of Miss P. Horton's *Ophelia*, the best we have seen for many years—if, in truth, we ever saw a better; for even in person it was fortunate, with the long yellow Danish-looking tresses of the actress. It possessed all the charms of simplicity and nature, with a degree of feeling of the most touching kind; and the snatches of song were sung in a style with which the wet eyes of many a listener shewed their deep and growing sympathy, till her final exit was marked with enthusiastic thunders of approbation. We have always held but one opinion of this young lady, and we rejoice in every new success which justifies it. Let her only be allowed opportunities to exercise her talents, and the *Ariel* and *Ophelia* of the last few months will shine yet more in more important characters. She has mind to work upon, and sensibility whence to draw upon the emotions of others; and without these qualities all the rest is leather and prunella. The remainder of the *dramatis personæ* do not demand much observation. Mr. Webster's *Orric* was good; and Mr. J. Webster's *Horatio*, quiet and respectable. Mr. Lacy's *Laertes* was rather out of his line; and Mr. Oxberry's *Gravedigger*, certainly not less out of his. After the play, *Tim Moore* kept the house in roars of laughter till we were obliged to quit. Every night Power adds some novel fun to this most ludicrous piece: he is inexhaustible.

The *Queen's Theatre* has been brightened by the appearance of Persiani as *Amina* in *La Sonnambula*, and F. Elsler in the ballet. The delicious organ of the former was never heard to more advantage; and the agility of the latter gave a fill-up to the languishing dance.

*Olympic*.—The *Ladies' Club* at the Olympic have had the rare good fortune to find in Mrs. Stirling a *Chair-Woman* to succeed their late Presidentess, Glover. It surprises us that petty-coat government should be so successful, and display so much ready talent; so much, indeed, that we are becoming every day more and more confirmed in the suspicion that the world has hitherto proceeded (except in the case of the Amazons) altogether on an erroneous principle, and that it is full time to "change all that," and try how we shall go on with the female instead of the male sex paramount. Mrs. Stirling, at any rate, is quite delightful as a ruler.

#### VARIETIES.

*Booksellers' Provident Institution*.—The annual meeting of this commendable Institution on Thursday week (Mr. James Nisbet in the chair) was of the most satisfactory character. Within only three years the fund has realised

8525l. 19s. 2d. The expenses have only amounted to 237l. 19s. 2d. There have, as yet, been no claimants upon the fund—charity we ought scarcely to call it, seeing, that it is supported not only by honorary life and annual subscribers, but by ordinary members who have an interest in the results; the whole being for the permanent or temporary assistance of persons employed in various branches of the book-trade.

*Another Comet*.—M. Galle has discovered a third comet within the space of three months. On the 7th (it is stated in a letter to Sir J. South), 28<sup>th</sup> 15<sup>h</sup> 15<sup>m</sup> after 5 P.M., mean time at Berlin; its right ascension was 322° 58' 22<sup>h</sup>, and its northern declination 28° 18' 47<sup>h</sup>. On the 8th, at 21<sup>h</sup> 52<sup>m</sup> after 3 P.M., its right ascension was 324° 30' 6<sup>h</sup>, and northern declination 29° 8'. When first seen, it was a little north, preceding  $\mu$  Cygni, and the next day near  $\eta$  Pegasi.

#### ANACREONTICA.

##### VII.

"Ὅδε πῦρ" Ἐσπερὸς φανίστες  
Χάριτες, κ. τ. λ.

Lo! Spring descends;—around her path  
The Graces shower their brightest roses;  
At her approach e'en Ocean smiles,  
His thunder now reposes.

See! where the coot delighted dives,  
Where soars the wandering crane on high:  
O'er all the scene the sun looks forth,  
No clouds obscure the sky.

With kindest fruits now teems the Earth,  
Now buds the olive, plant divine;  
And clusters, countless as the leaves,  
Weigh down the laughing vine.

##### VIII.

Χαλιδὼν τὸ μὴ φιλήσαι,  
Χαλιδὼν, κ. τ. λ.

'Tis painful not to love, 'tis true,  
And yet, to love is painful too;  
But ah! more painful 'tis to burn  
With love that never meets return.  
What now, in sooth, avails the claim  
Of genius, birth, or honest fame?  
Gold now is all in all below;  
For gold alone each breast doth glow.  
Curst be the wretch who first loved gold!  
That fruitful source of plagues untold:  
'Tis this that oft makes brethren part;  
'Tis this that steals a parent's heart;  
Hence murders rise, hence horrid wars,  
With all their train of diabolical jars;  
And, worst of ills beneath the sky,  
Hence lovers too untimely die.—R. B. S.

*H. B.'s Nos. 629, 30*.—In the first we have Lord John Russell as Mucipula, a wonderfully clever piece of caricaturing, by which the artist retains the features of the minister, and, at the same time, faithfully copies the original painting of Sir Joshua Reynolds. He holds the poor sheriff in a mouse-trap; and Sir R. Peel, as a cat, is ready to pounce upon him should he attempt to escape. The next is a tableau from the new play of "Mary Stuart," and represents the entrance of Ruthven and his associates to murder Rizzio, only the Duke of Wellington is in Macready's armour; Lord Melbourne is the favoured minstrel; and our gracious Queen is the hapless Mary.

*Black's General Atlas, Part VII.*—Mr. Sidney Hall has here completed his work in fifty-four maps; and we are sure that those who began with it have no cause to be dissatisfied with the manner in which it has been carried on and finished.

The United States Museum was opened on Thursday evening, Major S. Clarke, V.P., in the chair.—Great accessions of curious matters have been accumulating since last season, and the proceedings of the meeting, as well as the account of the progress of the Institution, were most gratifying and satisfactory.

*The Artists' General Benevolent Fund Anniversary*, on Friday next, with the President of the Royal Society in the chair, is of most auspicious promise. Twenty-five zealous stewards to co-operate with the friends of this excellent Institution must give it a strong impulse, and we anticipate an excellent meeting.

*The Spirit of Literature, No. 1.*, of which twelve numbers are announced to form a volume, is a very mixed *cento* of extracts from a multitude of authors.

*Geology*.—Petrified reptiles of the Saurian kind are reported to have been found in immense numbers in Fanning County, Texas.

*Temperance Literature, &c.*—"Persons wishing to seign the pledge of the total abstinence society may—by applying within."—In a respectable-looking shop-window in Porter Street. "Sum good hauns wanted in this busenias."—Ditto, in Crown Street.

## LITERARY NOVELTIES.

In the Press.

A New Work on the Physical and Moral Management of Early Infancy, by Dr. Andrew Combe.—A New and Complete Edition of the Works of Fielding, in one volume, is announced, with a Life by Mr. Thomas Roscoe.

## LIST OF NEW BOOKS.

The King's Highway; a Novel, by G. P. R. James. 8vo. 3 vols. post 8vo. 11s. 6d.—Dr. Burton's Manual of Land and Fresh-water Shells, 3d edition, enlarged by J. E. Gray, Esq., with many coloured Plates, post 8vo. 15s.—Narrative of a Voyage to Madeira, Teneriffe, &c., by W. R. Wilde, 2 vols. 8vo. 28s.—Hardy's Hours of Thought, fcap 8vo. 5s.—The Boy and the Birds, by Emily Taylor, 2d edition, square, 3s. 6d.—Fulton's Teacher's Manual, and Key to Calculations, 12mo. 2s.—Treatise on Syphilis, by Herbert Mayo, 8vo. 5s. 6d.—Poems of Chivalry, &c., by W. Pridoux, 6s.—The Countess, by T. S. Fay, 3 vols. post 8vo. 11s. 6d.—The Vishnu Purana: Hindu Mythology translated, by H. H. Wilson, 4to. 2s.—Persecutions of the Lutheran Church in Prussia, 18mo. 1s. 6d.—Four Sermons in Advent, by the Rev. F. Parry, 12mo. 2s. 6d.—Rev. C. Girdlestone's Commentary on the Old Testament, Part V., 8vo. 9s.—Acliphron, a Poem, by T. Moore, new edition, fcap. 3s. 6d.—Epicurean, a Tale, by T. Moore, new edition, fcap. 7s.—G. W. Cooke's History of Parry, 3d edition, 3 vols. 8vo. 11s. 6d.—The Anatomist's Vade Mecum, by W. J. E. Wilson, 12mo. 12s. 6d.—M'Crie's Life of John Knox, 6th edition, 8vo. 7s. 6d.—Goodwin's Child of Light Walking in Darkness, new edition, fcap. 3s. 6d.—Apostolic Instruction Exemplified in the 1st Epistle General of St. John, 12mo. 6s.—Memoir of the Rev. D. Rowlands, by the Rev. J. Owen, 12mo. 4s. 6d.—Lyra Urbanica; or, the Social Effusions of the celebrated Charles Morris, 3 vols. post 8vo. 11s.—Owen's Book of the Roads, new edition, with an Account of the Railroads, and a Map, 12mo. 3s.—The Year-book of Facts, 1840, fcap. 6s.—St Paul's Epistle to the Romans Explained, 2d edition, 12mo. 3s.—Queen of Flowers; or, Memoirs of the Rose, 2d edition, 18mo. 6s.—Beckford's Thoughts on Hunting, new edition, 12mo. 6s.—Dwight's Theology, new edition, 5 vols. 18mo. 15s.

## METHEOLOGICAL JOURNAL, 1840.

Wind, north-west on the 12th and two following days; on the 15th, west and south-west; since, north-east. On the 12th and two following days, generally cloudy; the 15th, overcast, small rain falling nearly all the day; the 16th and 17th, generally clear; a little rain fell during the morning of the 16th; the 18th, overcast, small rain fell occasionally.

Rain fallen, 1.175 of an inch.  
Edmonton. CHARLES HENRY ADAMS.

## TO CORRESPONDENTS.

We beg to direct the attention of our scientific readers to the report of proceedings at the last Royal Institution meeting.

ARTISTS' GENERAL BENEVOLENT INSTITUTION, for the Relief of Decayed Artists, their Widows, and Orphans, under the immediate Patronage of Her Most Excellent Majesty the QUEEN.

## BRITISH INSTITUTION,

PALL MALL.  
The Gallery for the Exhibition and Sale of the Works of British Artists is open daily, from Ten in the Morning until Five in the Evening.

Admission, 1s. Catalogue, 1s.  
WILLIAM BARNARD, Keeper.

## BRITISH ASSOCIATION for the

ADVANCEMENT OF SCIENCE. Meeting in Glasgow, 17th September, 1840.

Trustees (permanent).  
RODERICK IMPEY MURCHISON, Esq. F.R.S.  
JOHN TAYLOR, Esq. F.R.S. Treas. G.S.  
FRANCIS BAILEY, Esq. V.P.R.S.

Officers and Members of Council appointed at Birmingham, in 1839, for the Glasgow Meeting, 1840.

## President.

THE MARQUESS OF BREADALBANE, F.R.S.

## Vice-Presidents.

The Very Rev. PRINCIPAL MACPARIAN.  
Major-General Lord GREENOCK, F.R.S.  
Sir DAVID BREWSTER, LL.D. F.R.S. L. and E.  
Sir THOMAS M'DOUGALL BRISBANE, Lieut.-Gen.  
K.C. Pres. R.S.E.

## General Secretaries.

RODERICK I. MURCHISON, Esq. F.R.S. F.G.S.  
Major EDWARD SABINE, V.P.R.S. F.R.A.S.

## General Treasurer.

JOHN TAYLOR, Esq. F.R.S. Treas. G.S.

## Assistant General Secretary.

JOHN PHILLIPS, Esq. F.R.S.

## Secretaries for Glasgow.

Professor J. P. NICHOL, LL.D.  
ANDREW LIDDELL, Esq.  
JOHN STRANG, Esq.

## Treasurer for Glasgow.

CHARLES FORBES, Esq.

## Local Council.

Which consists of Forty Members, delegated from the London Council. Duties: To elect Members; to see that no more are elected than can be accommodated at the various meetings; and account for the funds to the British Association. This Committee has resolved, in consequence of the limited accommodation, and the expected influx of strangers, to limit the number of new Members residing in Glasgow, or within fifteen miles, to 1000; and to give opportunity for the admission of strangers, and other preliminary business: resolved, also, that the books of enrolment shall be closed, as regards residents, on 1st July.

Convener, J. A. ANDERSON, Esq.

Sub-Convener, WM. BANKIER, Esq.

## Local Secretaries.

To whom all applications for Membership must be addressed.  
PROFESSOR NICHOL, LL.D. Glasgow College.  
ANDREW LIDDELL, Esq. 102 Argyll Street.  
JOHN STRANG, Esq. City Chamberlain.

## Local Treasurer.

CHARLES FORBES, Esq. Glasgow Union Bank.  
\*From and after 15th May, Professor Nichol will be on the Continent; and, therefore, the letters dated thereafter should be sent to Mr. Liddell or Mr. Strang.

## Committees.—On Finance.

Which consists of Forty-eight Members. Duties: To raise and apply the funds required for all local purposes, but not to interfere with the funds raised by the Local Council; and, in concert with that Council, to fix the number and regulate the admission of Ladies to the Meetings, &c. &c.

The Hon. the LORD PROVOST, Convener.  
JOHN LEADBETTER, Esq. Sub-Convener.  
JAMES M'CLELLAND, Esq. Accountant, Secretary and Treasurer.

To provide Lodgings and other Accommodations. — Which consists of Twenty-four Members. Duties: To provide and fix up Halls and Rooms for the various Meetings and Exhibitions—Arrange about Ordinances—Lodgings for Strangers—Adapting Meetings.

WILLIAM RAMSAY, Esq. Professor of Humanity, Convener.  
JAMES SMITH, Esq. A. B. Liddell, Sub-Convener.  
ALEXANDER M'DOWALL, Esq. Writer, Secretary.

On Exhibition of Models and Manufactures. — Which consists of thirty-three Ordinary Members. Duties: To collect and arrange for Public Exhibition, in a Large Hall, Models of Art and Manufactures. This Committee has Forty-five Corresponding Members or Committees in many of the largest towns of the United Empire.

JOHN HOULDAWORTH, Esq. Convener.  
WILLIAM HUSSEY, Esq. Sub-Convener.  
JAMES THOMSON, Esq. C. E. Secretary.

On Museum of Minerals found in the West of Scotland. — Which consists of Thirty-four Ordinary and Ordinary Members, and Thirteen Corresponding Members. Duties: To select from the College, Aberdeen University, and from Private Collections, as also to purchase Specimens illustrative of the Mineral and Geological Structure of the West of Scotland.—To get prepared Maps and Charts of the same, and to arrange the whole for Public Exhibition in Library Hall of the College or other large building. This Committee has subdivided itself into Five Sub-Committees, viz. 1st. On the Coal-field of Lanarkshire. Geological Map of District around Glasgow, and Section of the Strata to the Coal-field. 2d. On Fossil Flora. 3d. On the Tertiary Formations. 4th. On Simple Minerals. 5th. On Model of Arran, with Specimens illustrative of its Formation.

THOMAS EDINGTON, Esq. F.R.S. Convener.  
WILLIAM MURRAY, Esq. of Monkland Iron Works, Sub-Convener.

DR. WILLIAM COUPER, Professor of Natural History, Curator.  
THOMAS EDINGTON, jun. Esq. Secretary.

ARTISTS' GENERAL BENEVOLENT INSTITUTION, for the Relief of Decayed Artists, their Widows, and Orphans, under the immediate Patronage of Her Most Excellent Majesty the QUEEN.

PATRON—His Royal Highness the DUKE of SUSSEX, K.G.

## VICE-PATRONS.

The Duke of Buccleuch  
The Duke of Devonshire  
The Duke of Sutherland  
The Marquess of Londonderry  
The Marquess of Westminster  
The Earl of Shrewsbury  
The Earl of Dartmouth

PRESIDENT—Sir MARTIN ARCHER SHEE, P.R.A.

## VICE-PRESIDENTS.

Thos. Phillips, Esq. R.A.  
Sir Francis Chantrey, R.A.  
Sir David Wilkie, R.A.  
Sir Robert Smirke, R.A.  
Sir Richard Westmacott, R.A.

The Nobility, Friends, and Subscribers, are respectfully informed that the TWENTY-FIFTH ANNIVERSARY FETE V.A. will be celebrated in FREEMASONS' HALL, on Friday, the 5th inst.

The Most Noble the MARQUESS of NORTHAMPTON, P.R.S. in the Chair.

## STEWARDS.

Rev. E. T. Daniell  
Henry R. Abraham, Esq.  
John Armstrong, Esq.  
Jacob Bell, Esq.  
W. M. Browne, Esq.  
Thos. Sydney Cooper, Esq.

Angus Fletcher, Esq.  
R. Carter Hall, Esq.  
Philip Hardwick, Esq. A.R.A.  
John Kirkpatrick, Esq.  
E. Landells, Esq.

Dinner on Table at Six precisely.

Tickets, 12s. each, and of the Stewards; of Charles Fowler, Esq. 1 Gordon Square; and of the Assistant-Secretary, 14 Osborn Street, Regent's Park.

WM. JOHN ROPER, Assistant-Sec.

## UNIVERSITY OF LONDON. FACULTY OF LAWS.

THE EXAMINATION for the DEGREE of BACHELOR OF LAWS in this University for the current Year will commence on MONDAY, the 8th of November. Candidates must send in their Applications to the Registrar by the 15th of April next.

Somersec House, 18-A March, 1840.

By order of the Senate,  
R. W. ROTHMAN, Registrar.

Under the Superintendence of the Society for the Diffusion of Useful Knowledge.

POLITICAL SERIES.—On the 16th inst. will be published, at the Society's Office, the Second Number of this Series; being a TREATISE on the PRINCIPLES OF GOVERNMENT. The succeeding numbers will appear on the 15th of every month. No. 1. will conclude the "Principles of Government," and will be followed by treatises of the various forms of government.

50 Lincoln's Inn Fields, 12th March, 1840.

## INDIA, PERSIA, and CAUBUL.—

WYLD'S MAP of all the COUNTRIES lying between TURKEY and BURMAH; comprising Asia, Persia, and Arabia, and including the Black, Caspian, and Red Seas, particularly constructed to show the overland route to India, and the relative position of Russia to the Anglo-Indian possessions, with Enlarged Plans of the Dardanelles and Bosphorus. Four Sheets, 11s.; Case, 12s. 6d.

Map of India, constructed with great care and research from the latest authorities, and intended more particularly to facilitate a reference to the Civil and Military Nations, with a Polymetrical Table of Reciprocal Distances. One large Sheet, 15s.; Case, 11s.

An Index to Wyld's Map of India, containing the Names of many Thousand Places, with their Latitude and Longitude, 8vo. 10s.

Published by James Wyld, Geographer to the Queen, Charing Cross East, four doors from Trafalgar Square, London.

## CHINA; Constructed from Original

Surveys. One large Sheet, 8s.; in a Case, 12s.

Asia; One Sheet, 6s.; in a Case, 8s. 6d.

The River and Harbour of Canton, with Entrance, and Islands, &c. 6d.

James Wyld, Geographer to the Queen, Charing Cross East.

## ROSS'S PORTRAIT of the QUEEN.

Just published (by Permission of Her Majesty), a Portrait of the Queen, drawn on Stone by E. Lane, Esq. A.R.A. from the Portrait of Her Majesty by W. C. Ross, Esq. A.R.A. now in the possession of Prince Albert, and forming a Companion Print to the Portrait of His Royal Highness, painted and drawn by the same artists.

"Her Majesty sat for the miniature a short time before her marriage; and it is one of the artist's most successful efforts. The likeness is perfect, and the features have that sweet and animated expression which is so engaging in the original."—Morning Chronicle, March 10.

Prints, 5s.; Proofs, 10s. 6d.

London: Colnaghi and Puckle, Printers to the Queen, &c. 22 Cockspur Street, Charing Cross; and of all Printers in the Kingdom.

## MAJOR PATTERSON'S NEW WORK.

**CAMP and QUARTERS:** Scenes of Military Life.

By Major PATTERSON,  
Author of "Adventures in the 50th or Queen's Own Regiment."  
"Major Patterson has been a hard fighter, and here gives his descriptions of perilous marches, dangers escaped, and battles won. We heartily recommend his volumes to the admirers of spirit, life, and enterprise."—*Metropolitan*.  
Saunders and Otley, Publishers, Conduit Street.

## MR. COLBURN'S NEW PUBLICATIONS, NOW READY.

**PRINCE ALBERT** and  
**PRINCE ERNEST'S SONGS and BALLADS.**  
Revised Copies of this Work (containing Forty-two Pages of Music) may now be had of all Book and Music-sellers throughout the Kingdom. Price 12s. with fine Portrait of Prince Albert.

## Mrs. Trollope's Widow Married.

A Sequel to "Widow Barnaby."  
3 vols. post 8vo. with Twenty-one humorous Illustrations by Nass.

## Colburn's Calendar of Amusements in Town and Country, for 1840.

## LIFE and LETTERS OF CICERO.

**THE LIFE and LETTERS OF MARCUS TULLIUS CICERO.**

Contents:—

1. The Life of Cicero, by Dr. Middleton.

2. Cicero's Letters to his Friends, translated by Wm. Melmoth.

3. Cicero's Letters to Atticus, translated by Dr. Heberden.

The Life, by Dr. Middleton, may be had separately, price 2s. cloth.

Edward Moxon, Dover Street.

In 8vo. (pp. 60) price 1s.

**CONSIDERATIONS on the STATE OF the LAW regarding MARRIAGES with a DECEASED WIFE'S SISTER.**

By a Barrister of the Middle Temple.

London: Longman, Orme, and Co.

**Marriage Act, 5th and 6th William IV.**

s. 54; commonly called Lord Lyndhurst's Act.—Parties aggrieved by the above Act, which prohibits Marriages with a Deceased Wife's Sister, are earnestly solicited to co-operate in an endeavour now making to obtain its repeal. The prohibition has no foundation either in religion or morality, and cannot be supported upon any ground of rational expediency.  
Apply to A. B., care of Messrs. Wilson and Ogilvy, Printers, 37 Skinner Street, Snowhill.—Names will be scrupulously concealed, if desired.

In post 8vo. price 6s. Illustrated with upwards of Sixty Woodcuts.

**THE FRUIT, FLOWER, and KITCHEN GARDEN;**

forming the Article "Horticulture" in the Seventh Edition of the "Encyclopædia Britannica."

By PATRICK NELL, LL.D. F.R.S.E. Secretary to the Caledonian Horticultural Society.

"One of the best modern books on gardening extant; clear, comprehensive, and in every respect well reasoned."—*London's Gardener's Magazine*.

Adam and Charles Black, Edinburgh; Longman and Co.; Simpkin, Marshall, and Co.; Whittaker and Co.; and Hamilton, Adams, and Co. London.

**ON STRICTURE, PILES, and other DISEASES OF the LOWER INTESTINE.**

Likewise,

On Protrusions, price 5s. 6d.

By FREDERICK SALMON, F.R.C.S.

Surgeon to the Infirmary for Fistula, and other Diseases of the Rectum, 38 Charterhouse Square.

Whittaker, Ave Maria Lane; and Wacey, 4 Old Broad Street.

In an elegant case, resembling a handsome 4to. vol. ornamentally bound and gilt, price Two Guineas.

**THE BEAUTY OF the HEAVENS.**

Consisting of One Hundred and Four Scenes, or separate Tableaux, beautifully coloured, representing the principal Astronomical Phenomena of the Universe, accompanied by, and illustrating an Elementary Lecture on Astronomy, expressly adapted for family instruction and Entertainment.

By CHARLES F. BLUNT,

Lecturer on Astronomy, Author of "The Wonders of the Telescope," &c.

Whithead and Co. 78 Fleet Street; also Ackermanns and Co. Strand; and C. Tilt, Fleet Street.

Part I. with Fifty Plates, and Seven Sheets of Letterpress price 12. 11s. 6d. plain, 8vo.; and 2l. 12s. 6d. Proof, India paper, 4to.

**ODONTOGRAPHY; or, a TREATISE**

on the COMPARATIVE ANATOMY of the TEETH; their PHYSIOLOGICAL RELATIONS, MODE OF DEVELOPMENT, and MICROSCOPIC STRUCTURE in the VERTEBRATE ANIMALS.

By RICHARD OWEN, F.R.S.

Correspondent of the Royal Academies of Sciences, Paris, Berlin; Hunterian Professor to the Royal College of Surgeons, London.

This work will appear in Three Parts, and will be illustrated by upwards of 150 Plates, and to be completed in the course of the present year.—A List of Subscribers' Names will be given with the last Part.

London: H. Baillière, Foreign Bookseller and Publisher, 219 Regent Street.

**In 8vo. price 4s. 6d. Part IV. (completing the First Volume) of a NEW GENERAL BIOGRAPHICAL**

DICTIONARY, projected and partly arranged by the late Rev. HUGH JAMES ROSE, B.D. Principal of King's College, London.

Edited by the Rev. HENRY J. ROSE, B.D.

Late Fellow of St. John's College, Cambridge.

Volume I. price 18s. cloth, lettered, will be ready for delivery in a few days.

London: B. Fellowes; J. G. F. and J. Rivington; Duncan and Malcolm; R. Hodgson; G. Lawford; J. M. Richardson; J. Behn; J. Bain; R. Hodgson; J. Dowling; G. and A. Greenland; F. C. Westley; J. Fraser; L. A. Lewis; James Bohn; Capes and Co.; J. and J. Deighton, Cambridge; and J. H. Parker, Oxford.

8d edition, Vols. I. and II. 10s. 6d. each.

**HISTORY of the REFORMATION in GERMANY, SWITZERLAND, &c.**

By J. H. MERLE D'AUBIGNÉ,

President of the Theological School of Geneva, and Member of the Société Evangélique.

The work opens with a succinct account of the state of Christianity at the opening of the sixteenth century, as exhibited in interesting traits and experience of men in different ranks. We see the manner in which truth long lost or obscured was recovered from the pages of the Bible; and we learn the ways of that Providence that brought out into "the liberty of sons" those who had long struggled in that desire "to justify themselves," which is the spring of distress of heart.

See high commendations in *Edinburgh Review*, *Eclectic*, *Evangelical*, *Gentleman's Magazine*, and *Record*.

D. Wither, 43 Piccadilly.

**With Frontispiece and Vignette, price 6s. cloth, THE RELIGIOUS WARS OF FRANCE,**

from the Accession of Henry II. to the Peace of Vervins.

By JONATHAN DUNCAN, B.A. Author of "Memoirs of the Dukes of Normandy;" "Religions of Profane Antiquity," &c. &c.

"In laying bare the detestable machinations of Jesuitism, our object has been, not to heap animadversion on the past, but to warn present and future generations to shun the vices of their predecessors."—*Preface*.

Joseph Rickerby, Rhetorhouse Lane, King William Street, City; and to be had of all Booksellers.

Price 3s. 6d.

Simpkin and Marshall, Stationers' Court, London.

**A TREATISE on the REAL NATURE**

of the SIN of ADAM. (A New Exposition.)

Shewing the Great Importance of a Right Understanding of the Subject, as regards the Primary Dogmas of the Christian Religion.

Dedicated to all who Believe, and to those who Desire to Believe, the Holy Scriptures.

"Fiat Lux."

Printed by HANNAH PAGE MOYES, of Brook Green, Hammersmith, and GEORGE BARCLAY, of Number 2 Pullin's Place, Islington, both in the County of Middlesex, Printers, at their Printing Office, Number 28 Castle Street, Leicester Square, in the said County; and published by WILLIAM ARMIGER SCRIPPS, of Number 13 South Molton Street, in the Parish of Saint George, Hanover Square, in the County aforesaid, at the LITERARY GAZETTE OFFICE, Number 7 Wellington Street, Watling Bridge, Strand, in the said County, on Saturday, March 21st, 1840.

LONDON, SATURDAY, MARCH 28, 1840.

PRICE 8d.  
Stamped Edition, 9d.

### REVIEWS OF NEW BOOKS.

*The King's Highway, a Novel.* By G. P. R. James, Esq. author of "The Robber," "The Gentleman of the Old School," &c. &c. 3 vols. 12mo. London, 1840. Longman and Co.

MR. JAMES seems determined to shew us that he is as versatile as he is prolific and inexhaustible. On almost every story he opens a new ground, and, peopling it with his very actual creations, makes his readers live in any country, at any time, and under any circumstances, it may please his genius to invent, and his talents to realise. It is not easy to find new language on every occasion to express the pleasure we receive from this gentleman's writings; suffice it to say, that we look forward to them as we were wont to do to those of the great man in whose footsteps he is following, and never suffer a disappointment. We cannot pay him a higher compliment; and we rejoice to say that *The King's Highway* will rather elevate him in, than depress him from, the rank he has so gallantly won among the most popular authors of his age and country.

The period chosen for this tale is one of the greatest interest, and affording scope for the most striking vicissitudes without violating probability. It opens with a scene consequent upon the Battle of the Boyne; and all the parties involved in it have their fortunes shaped and chequered by their adherence to James or William. The free use of the "Stand and Deliver" principle produces many of the leading events and consequences in the plot, which is altogether cunningly and admirably contrived to excite our curiosity for the result. The characters are drawn with much skill, and, as usual with our author, the descriptive parts are exact and excellent. We fancy we are upon every spot where he lays his incidents, and seeing and hearing the beings whom he employs to involve and work out his lifelike history. These are superior merits, and when we add that in these volumes we find even more of moral and philosophical reflection, and acute views of men and things, than in Mr. James's most successful works, we have said enough to send them to the public with the praise they so justly deserve.

Agreeably to our rule not to interfere with the plot, and thereby mar a chief charm in novel-reading, we must now endeavour to select a few insulated passages to illustrate some of the opinions we have thus briefly expressed:—

"The heart of the traveller then was ill—very ill at ease, but yet the calm of that evening's sunshine had a sweet and tranquillising effect. There is a mirror—there is certainly a moral mirror in our hearts, which reflects the images of the things around us; and every change that comes over nature's face is mingled sweetly, though too often unnoticed, with the thoughts and feelings called forth by other things. The effect of that calm evening upon Lennard Sherbrooke was not to produce the wild, bright, visionary dreams and expectations, which seem the peculiar offspring of the glowing morning, or of the bright and risen day; but it was the counterpart, the image, the reflection of that evening scene itself, to

which it gave rise in his heart. He felt tranquillised, he felt more resolute, more capable of enduring. Grief and anxiety subsided into melancholy and resolution, and the sweet influence of the hour had also an effect beyond: it made him pause upon the memories of his past life, upon many a scene of idle profligacy, revel, and riot,—of talents cast away and opportunity neglected,—of fortune spent and bright hopes blasted,—and of all the great advantages which he had once possessed utterly lost and gone, with the exception of a kind and generous heart: a jewel, indeed, but one which in this world, alas! can but too seldom be turned to the advantage of the possessor. On these things he pondered, and a sweet and ennobling regret came upon him that it should be so—a regret which might have gone on to sincere repentance, to firm amendment, to the retrieval of fortunes, to an utter change of destiny, had the circumstances of the times, or any friendly voice and helping hand, led his mind on upon that path wherein it had already taken the first step, and had opened out before him a way of retrieval, instead of forcing him onward down the hill of destruction. But, alas! those were not times when the opportunity of doing better was likely to be allowed to him; nor were circumstances destined to change his course. His destiny, like that of many Jacobites of the day, was but to be from ruin to ruin; and let it be remembered, that the character and history of Lennard Sherbrooke are not ideal, but are copied faithfully from a true but sad history of a life in those times. All natural affections sweeten and purify the human heart. Like every thing else given us immediately from God, their natural tendency is to wage war against all that is evil within us."

How true and fine this is; and the following comes yet more home to our breast:—

"It is a false and a mistaken notion altogether, that men of great mind and intense thought are easily wearied or annoyed by the presence of children. The man who is wearied with children must always be childish himself in mind; but, alas! not young in heart. He must be light, superficial, though perhaps inquiring and intelligent; but neither gentle in spirit nor fresh in feeling. Such men must always soon become wearied with children; for very great similarity of thought and of mind—the paradox is but seeming—is naturally wearisome in another; while, on the contrary, similarity of feeling and of heart is that bond which binds our affections together. Where both similarities are combined, we may be most happy in the society of our counterpart; but where the link between the hearts is wanting there will always be great tediousness in great similarity."

The subjoined portion of a dialogue between Wilton (the hero of the piece) and Lord Sherbrooke, the spoilt son of the minister whose secretary he is, will give a slight taste of the spirit breathed into these colloquies:—

"Indeed, my lord," replied Wilton, "you would particularly oblige me by making no effort to change the position in which I am placed. All the communication which takes

place between your lordship's father and myself is quite sufficient for the transaction of business, and we can never stand in any other relation towards each other than that of minister and private secretary." "Or clerk, as he called you to me to-day," said Lord Sherbrooke, dryly. "The name matters very little, my lord," replied Wilton; "he calls me *secretary* to myself, and such he stated me to be in the little memorandum of my appointment, which he gave me; but if it please him better to call me clerk, why, let him do it." "Oh! I shall not remonstrate," replied Lord Sherbrooke; "I never argue with my father. In the first place, it would be undutiful and disrespectful, and I am the most dutiful of all sons; and in the next place, he generally somehow gets the better of me in argument—the more completely the more wrong he is. But, nevertheless, I can find means to drive him, if not to persuade him; to lead him, if not to convince him; and having had my own way from childhood up to the present hour—alas! that I should say it, after having taken the way that I have taken—I do not intend to give it up just now, so I will soon drive him to a different way with you, while you have no share in the matter, but that of merely suffering me to assume, at once, the character of an old friend, and not an insincere one. On the latter point, indeed, you must believe me to be just as sincere as my father is insincere; for you very well know, Wilton, that, in this world of ours, it is much more by avoiding the faults than by following the virtues of our parents, that we get on in life. Every fool can see where his father is a fool, and can take care not to be foolish in the same way; but it is a much more difficult thing to appreciate a father's wisdom, and learn to be wise like him." "The latter, my lord, I should think, would be the nobler endeavour," replied Wilton; "though I cannot say what would have been my own case, if I had ever had the happiness of knowing a father's care." Lord Sherbrooke for a moment or two made no reply, but looked down upon the ground, apparently struck by the tone in which Wilton spoke. He answered at length, however, raising his eyes with one of his gay looks, "After all, we are but mortals, my dear Wilton, and we must have our little follies and vices. I would not be an angel for the world, for my part; and besides—for so staid and sober a young man as you are—you forget that I have a duty to perform towards my father, to check him when I see him going wrong, and to put him in the right way; to afford him, now and then, a little filial correction, and take care of his morals and his education. Why, if he had not me to look after him, I do not know what would become of him. However, I see," he added, in a graver tone, "that I must not jest with you, until you know me and understand me better. What I mean is, that we are to be friends, remember. It is all arranged between the Earl of Sunbury and myself. We are to be friends, then; and such being the case, I will take care that my Lord of Byerdale does not call my friend his clerk, nor treat him in any other manner than as my friend. And now, Wilton, set about the

matter as fast as ever you can. There is my letter of recommendation from the Earl of Sunbury, which I hope will break down some barriers; the rest I must do for myself. You will find me full of faults, full of follies, and full of vices; for though it may be a difficult thing to be full of three things at once, yet the faults, follies, and vices within me, seem to fill me altogether, each in turn, and yet altogether. In fact, they put me in mind of two liquids with which I once saw an Italian conjuror perform a curious trick. He filled a glass with a certain liquid, which looked like water, up to the very brim, and then poured in a considerable quantity of another liquid without increasing the liquid in the glass by a drop. Now sometimes my folly seems to fill me so completely, that I should think there was no room for vices, but those vices find some means to slip in without incommencing me in the least. However, I will leave you now to read your letters, and to wonder at your sage and prudent friend, the Earl of Sunbury, having introduced to your acquaintance, and recommended to your friendship, one who has made half the capitals of Europe ring with his pranks. The secret is, Wilton, that the earl knows both me and you. He pays you the high compliment of thinking you can be the companion of a very faulty man, without acquiring his faults; and he knows that, though I cannot cure myself of my own errors, I hate them too much to wish any one to imitate them."

*The Linendrapers' Magna Charta; or, an Easy and Pleasant Mode of Diminishing Shopkeepers' Confinement, Increasing their Physical Energies, and Augmenting their Knowledge, Respectability, and Happiness.* By Philanthropos. 8vo. pp. 29. London, 1840. Whittaker and Co.

A VERY tiny pamphlet; but then the matter! It is not "words, words, words," but a real, genuine scheme for bettering the condition of Linendrapers' Shopmen, and wringing from their reluctant tyrants no less than a "*Magna Charta*," just as the bold British barons of old wrung one from King John! When we looked on the title-page, we could not help laughing at the odd juxtaposition of phraseology—"Linendrapers"—"*Magna Charta*;" men and measures; or at least shopkeepers and parchment to make measures of.

Our valiant Knight of the Ellwand goeth forth to battle in stout panoply. Runnymede, with its fugitive-sounding name, needed not to have been ashamed of such as he; even though as yet the plan has not been adopted for increasing his "physical energies." In truth we hardly know why such a surplage can be desired. Tapes, ferret, thread, ribands, pins and needles, bodkins, thimbles, hooks and eyes, buttons, bobbin, laces, gimp, tulle, net, cambric, crape, gauze, muslin, chintz, gingham, dimity, calico; yea, tabbinets, merinos, silks, satins, and great linen webs, do not require the strength of giants to handle them. Why, then, should Philanthropos wish to have Titans to do what would be much better done by women? Why augment the forces of these pseudo-whiskerandos, who are already burly and big enough to charm, or fancy they charm, every female for whom they spread out the counters' and their own attractions? Like the French judge, when the felon excused himself for his crime, with *Il faut que je vive*, we may say, we "see no necessity for it." Then with regard to the scientific modes by which it is proposed to accomplish an easy and pleasant mode of dimin-

ishing confinement, science is certainly excellent in its way, and can do much; but it strikes us that a very easy method might be suggested without scientific reference at all, viz. by coming an hour later to the shop, bazar, or warehouse, in the morning, and going an hour earlier at night.

But we must address ourselves to the text. "Books (says Philanthropos) are innumerable. Then why (he inquires) add to their number?" and he answers himself, "Because the writings of authors, though glowing as a comet, and resplendent as a meteor, like the foregoing luminaries, have in no way diminished the icy coldness of the winter eve—have but in a small degree tended to the decrease of human suffering."

In despite of this bright simile he lowers his tone, and, with that pride which apes humility, proclaims, that "the writer of this pamphlet affects not to shine; he aspires only to kindle a fire, which, though perhaps as humble as the embers of a cottage hearth, may be instrumental in inclining his fellow-labourers to contemplate on their grievances, and may yield a spark whence mighty spirits may blow a flame, which shall cause the conflagration and extermination of all our woes. The essay now presented to the public claims no merit as a literary composition; its sentences are irregular; its connexion is imperfect. But these defects are caused by the scarcity of leisure, and by the deficiency of that solitude so indispensable for study and meditation. Indeed the whole of the tract, because of its indifferent execution, is an *ocular proof* that the assistants' reasons for complaint are real and urgent."

This is fine, in imagery, in imagination, in felicity of expression, and in depth of thought. The fire instrumental towards the contemplative mood is true to nature, and suggestive of a picture worthy of Wilkie. We see the shopman with the dying embers at his feet, his elbows on his knees, his gallant head declined, and his eye, nevertheless, in wild frenzy rolling, brooding over the grievances of his condition, till he is wrought to a climax, and fit to yield that electric spark which mighty kindred spirits may blow into a flame (exactly as he is blowing, and they blow a cloud from their cigars), to conflagrate and exterminate all their woes!! No more will they then have to deplore the "scarcity of leisure" or "deficiency of solitude;" the former shall be abundant, and the latter ample; the supply of both quite equal to the demand, and, consequently, the "ocular proof" of the assistants' wants becomes all my eye and Betty Martin. No wonder that the author boastfully cries—

"I with confidence look forward to all that I have foretold concerning the renovation of that portion of society of which I am a member."

And he stands on sure foundations; for he tells us—

"He who promulgates Utopian projects, and yet lacks the means to prove the practicability of his schemes, deserves our contempt."

We admire the greater man who can demonstrate the practicability of "Utopian" schemes, and who has by him a full stock of the raw materials for the erection of all his visionary "grottoes, palaces, and airy castles!" So the illustrious Greek, Philanthropos; for, doth he not add?—

"In like manner I (by myself I) shall merit the name of a wild visionary, if the assistants who are the materials on which my hopes are founded, if they prove worthless, useless, crumbling, and rotten. But I believe those individuals to

be substantial, powerful, and wise. My credit hangs on their conduct. Let them but follow my counsel, and I am one who builds his fortress on the rock; let their present foolish conduct be continued, let them but neglect my advice, and I am one at whom fools may sneer, and idiots may scorn."

We are not very clear about the powerful and wise assistants being the victims of present foolish conduct, but we dare say it is with these wise fools, *Nemo mortalium omnibus horis sapit* (we translate for the younger and less learned of the trade), i.e. linendrapers' shopkeepers have committed some little acts of folly since the running of omnibuses. They must, however, give over, for "it becomes them deeply to weigh the position, that no party advances its ends one step, without proportionately retarding the progress of a weaker section of society," and they must take care to get a-head of the weaker sections rather than to be guilty of weakness themselves. See the danger:—

"Let but the agricultural labourer and the artisan be linked together by the mystic spell of the arts and sciences [oh, wonderful! 'let but;'] let them but ascertain that unprincipled tradesmen revel in luxury, because of exorbitant profits and unfair dealing; let them but learn those statistics, which prove that about one third of what is prepared for the use of mankind is the proportion of wealth consumed by these buyers and sellers of merchandise; let them but reflect on these facts—these awkward stubborn facts, and assuredly means will be devised that will demonstrate that 'union is strength.' Fancy all the inferior, but industrious classes in London purchasing goods, either by barter or money, of manufactures; picture immense storehouses, where this combination retailed drapery goods at cost price; bear in mind, nearly 2,000,000! are the actual profits of low drapery goods sold in the metropolis; and then judge whether, competition being displaced by coalition, the necessary expenses of these wholesale warehouses, founded by the masses, might not be curtailed to that degree that all the members of this combination might, in clothing alone, together make a saving of one million sterling. Drapers, masters, and men, consider where is your remedy? Meditate upon what might be, may be, and perhaps will be the effect of the universal dissemination of knowledge, and of the facility of intercourse between man and man. Have you resources that would check such a tide of human affairs; that would save employers from commercial distress, and would hinder working drapers from experiencing those miseries consequent on want of employ? As in the tale of 'Nicholas Nickleby,' there is a Smike and a Ralph Nickleby, so in the history of the drapery, I prophesy wrongly if the ill-used assistant and the gripping employer will not each share a destiny equal in misery to that of the two above-mentioned personages, to whom now they bear so faithful a resemblance. Only can we avert such fearful miseries by the practice of honourable and upright dealing. Only can assistants brave the gusts of ill fortune, by demanding that mental superiority which will procure a livelihood any where or every where. Let not employers be enraged, if assistants think for themselves, and speak for themselves [ay, and write for themselves]. Do not they continually suffer themselves to be guided by the same principle of self-preservation? Do not governors [query?] experience depression of spirits, with all its evil consequences, owing to the

present arrangements of the drapery system? Do they wish to perpetuate those evils consequent on the present system of late hours on their dependent relations? Will they by disallowing any innovation in the trade, immolate their offspring at the altar of their God MAXIMON, and thus imitate heathen parents, who throw their children into the fire to appease the wrath, and purchase the favours, of their ideal Divinities? No! we will hope more favourably. The spirit of benevolence, so active in the present day, shall animate those who hitherto have been our masters, now to become our friends and guardians."

Our trusty and well-beloved friend Philanthropos does not seem to see very clearly how his grand reform in the linendrapery line would affect the relations with other lines of business, all preying more or less one upon the other. It may be, and we dare say is true enough, that "governors," with whom his vocation has connected him so much as to unfold the secrets of their dealings, "revel in luxury because of exorbitant profits and unfair dealings;" but do not their neighbours do the same, so as to make the odds all even? If the linendraper cheat the baker, the butcher, the publican, the jeweller, the plumber, the grocer, the dyer, the buttermilkman, the hardwareman, the milkman, the oilman, the tripman, the bookseller, the dogmeatman, the printer, the barber, the stationer, the broker, the fruiterer, the pewterer, the poulterer, the cheesemonger, the perfumer, the tobacconist, the carpenter, the carman, the smith, the auctioneer, the currier, the furrier, the chanter, the brewer, the upholsterer, the undertaker, the upholsterer, the wine-merchant, the chandler, the music-seller, the coalman, the hatter, the silversmith, the toyman, the Italian-warehouseman, the miller, the dentist, the coachbuilder, the builder, the scavenger, the saddler, the bricklayer, the nightman, the engineer, the mealman, the pastrycook, the watchmaker, the victualer, the ginspinner, the cutler, the distiller, the painter, the tea-dealer, the horsedealer, the glazier, the glass and chinaman, the schoolmaster, the candlemaker, the shoemaker, the hosier, the glover, the lodgingletter, the apothecary, the tailor, the chemist, the printseller, the mercer, the fishmonger, the ironmonger, the fellmonger, the coster and every other monger;—do not the baker, the butcher, the publican, the jeweller, the plumber, the grocer, the dyer, the buttermilkman, the hardwareman, the milkman, the oilman, the tripman, the bookseller, the dogmeatman, the printer, the barber, the stationer, the broker, the fruiterer, the pewterer, the poulterer, the cheesemonger, the perfumer, the tobacconist, the carpenter, the carman, the smith, the auctioneer, the currier, the furrier, the chanter, the brewer, the upholsterer, the undertaker, the upholsterer, the wine-merchant, the chandler, the music-seller, the coalman, the hatter, the silversmith, the toyman, the Italian-warehouseman, the miller, the dentist, the coachbuilder, the builder, the scavenger, the saddler, the bricklayer, the nightman, the engineer, the mealman, the pastrycook, the watchmaker, the victualer, the ginspinner, the cutler, the distiller, the painter, the tea-dealer, the horsedealer, the glazier, the glass and chinaman, the schoolmaster, the candlemaker, the shoemaker, the hosier, the glover, the lodgingletter, the apothecary, the tailor, the chemist, the printseller, the mercer, the fishmonger, the ironmonger, the fellmonger, the coster and every other monger, cheat the linendraper in return?!!

In short, do not they all impose and prey upon one another and the public at large? Is there a trade or profession in the wide and voluminous "London Directory," which is not illustrated by a list of names of excellent men who live by daily lies and deceptions—including "Old Clos," whom nobody can cheat; and the attorney who cheats every body—and if they hold out paying their way, are they not called very respectable tradesmen? and if they scrape together considerable sums of money, are they not styled eminent So-and-Sos, men of the highest honour, credit, station, influence, and character? Now only fancy for a moment that any whole class of these man-devouring worthies should take it into their heads to abandon their predatory nature and habits, and live by honest means; what would be the consequences upon the other classes? Why the first principles and foundations of mercantile society would be uprooted; disorder and confusion would prevail, till worse than chaos would come again, and the British nation must sink under the useless experiment. No! "Honour among thieves." We have risen to be a mighty and flourishing empire, as our forefathers have been and as we are. So success to swindling and roguery in linendrapery, as by custom established; and long may every other trade emulate, and, if possible, surpass, the success of that wealthy, and, therefore, illustrious "line of business!"

Being of this opinion, and desiring that the "Assistants" should be encouraged to tread in the footsteps of their masters, we cannot concede to the force of the following arguments in favour of the contrariwise course, urged by Philanthropos:—

"The nature of assistants' employment, and the mental constitution of young men, whose education has never been matured, impels them to satisfy the cravings of the mind for excitement. This excitement can only be procured, owing to habits of associates, to poverty, and to late hours of business, in the alehouse, or in the brothel. Frequent resort to these haunts is expensive. Salaries, on an average, but barely suffice to support appearances and to defray incidental expenses. Consequently, in some few instances, governors may well question how clothes, good fellowship, Sunday merrymaking, wine and women, can all be freely indulged in, when wages will not amount to 50*l.* per annum."

These glimpses at the lives led by linendrapers' shopmen are creditable to their spirit; and acknowledging that the nature of their employments (serving the fair sex from morning till night), and their mental constitutions (?), must render such amusements essential for their happiness, we heartily join in the question, How can they accomplish it on fifty pounds a-year?—less than twenty shillings a-week! The thing is impossible, with the utmost moderation and economy; and we doubt if it can be carried into sufficient effect even by a new Drapery *Magna Charta*. But let it be fairly tried. Encourage Sunday merrymaking, and down with Sir Andrew Agnew and the saints: lower the duties on wine, and open the ports: clothe Naughtiness in purple and fine linen (to which every liberal draper will contribute), and feed, or pension it out of the consolidated fund; and all may go well towards the easy mode of diminishing confinement.\* Stop where you are, and shoplifters not shop-

\* Perhaps, however, a more pregnant and efficacious hint on this point is thrown out by Philanthropos himself at page 27, where he says:—

"The dressmakers, when we have furnished an example,

walkers must be the synonyme for the assistants, 200,000 of whom are here represented as spending ten millions a-year in leading this sort of Life in London!!! At present—

"In the sultry evening of summer, those employed in the leading houses can sometimes get an hour's grace before eleven, just to sit over a pot of half-and-half and hear some singing, or time enough to take a 'walk' with some fair."

We put it to the humane and compassionate if this be enough to content any man, even though his physical energies are destroyed by severe toils and late hours? Surely the shops should shut at seven (see what poetical alliteration flows into the canon), and the assistants, as required by their advocate Philanthropos, should have time afforded them to cultivate "gymnastic exercises, which strengthen the bodily constitution; dancing, fencing, archery, &c., which give a graceful polish to the gesture of the human form; musical festivals, vocal and instrumental; drawing and painting instruction, which is alike entertaining and beneficial; and games of skill, as chess, backgammon, &c., which either sharpen the reflecting faculties, or give an adroitness at manual labour, particularly serviceable to the linendraper."

The force of reason can no further go. In our mind's eye we see the pennyworth of tape meted out with the graceful polish and most elegant gesture of which the human form is susceptible. We see the Hercules and Apollo combined in the vendition of a skein of silk; and we see the adroitness of the herald Mercury beautifully hit off, whilst the customer is gammoned and check-mated by the proficient in these sharpening games called backgammon and chess.

Do we wish the national prosperity; do we admire justice; do we hate labour; do we love pleasure; and can we resist this heart-touching and mind-convincing appeal? Assuredly not. The government and the country have patronised the Linnean, let them now patronise the Linen Society. What are vegetables to men; what exotic plants, when compared with native drapers? Oh, legislators! speedily adopt a Measure for the web of existing calamity;† let not a nail's-breadth of time be lost, but expedite the *Magna Charta* of the impatient barons, whose scissors may also be as fatal as those of Atropos—"Clotho colum retinet, Lachesis net, et Atropos secat." Pause not to appoint a commission, or refer to a committee. Carry at once a counter-resolution; if an address to the throne be necessary, think of the dressmakers (page 27), and act with promptitude and vigour; pay the debt humanity owes to this oppressed body, and throw Owen overboard; above all, remember the wants of your royal mistress, our gracious sovereign: how could her majesty do without the goods furnished by linendrapers?

GOD SAVE THE QUEEN.

*Facts in Mesmerism, with Reasons for a Dispassionate Inquiry into it.* By the Rev. Chauncy Hare Townshend, A.M. 12mo. pp. 575. London, 1840. Longman and Co.

MR. TOWNSHEND almost entirely agrees will act as well for themselves as now they can talk for themselves. And thus one third of our prostitutes will be diminished.\* Such, then, is the prospect."

† Mover and seconder in the Lords, Lord Holland and Lord Lovelace; supported by Lords Hood, Lindsey, Sandon, Rolle, Eldon, and Eldonborough. Mover and seconder in the Commons, Mr. Bodkin and Sir Yard Butler; and ably supported by Mr. Plimsbury, Mr. Peck, and all the Eld-iots, Eld-ices, and Eld-ices; with the Gores for the dressmakers."

\* Evidently a misprint.—Ed. L. G.

with Dr. Elliotson, differing from him only in a few minor details connected with the phenomena observed. He sets out by answering the objections to the theory in which he is a firm believer, and then adduces a number of "facts" or cases, the result of his own experiments, which are certainly most remarkable and striking. These so nearly resemble the wonders of the London Hospital and Baron Dupotet, that we need not detail the particulars, which, like the former, are utterly beyond the bounds or explanations of sense, reason, and credibility. Still we are bound to say, that they seem to have been performed with every precaution to guard against collusion or trick; and, from our own knowledge of our friend Mr. Townshend (than whom a man of greater integrity or of sounder mind does not exist), we are confident that there is not a syllable stated by him which is not as worthy of attention as the evidence of any intelligent and veracious witness can possibly be in any possible inquiry.

Our opinion of mesmerism hitherto is upon record, and we will not entangle ourselves with any argument on the author's extraordinary and inexplicable cases. We quote, however, a passage from him to shew, that if mesmerism possess the power he contends for, it is a very dangerous art, and may be turned to the most atrocious purposes. He writes:—

"A curious circumstance, attending the mesmeriser's power over the patient's organisation, is this:—When the two are in frequent mesmeric relationship, the phenomenon is carried forward into the natural state. This I found to be the case after I had often mesmerised Anna M—— and E. A——. I could, at any time, fix the hand or arm of either of these persons in any position I pleased, and in all the rigidity of catalepsy."

Mr. Townshend's strongest points are, perhaps, the following:—

"To what end, then, is reason given us, if not to judge of things invisible by those which are clearly seen? For what purpose possess we the irresistible propensity to supply deficient links in a chain of causation, if not to prompt us where our senses fail? We move a magnet over a needle; the needle moves in a corresponding manner; and the human mind is so constituted that we cannot behold these two facts, in seeming connexion, without uniting them by a third, which we consider as proved by them, since it is in truth their necessary consequence. We infer that the effect is produced by means of a magnetic current or medium—a something which propagates motion from the magnet to the needle. This something we cannot, indeed, behold;—yet do we believe in it,—and with justice, for that which reason perceives to be necessary is not an invention, and can never be superfluous: on the contrary, the only immutable and essential truths come out of the mould of the intuitive reason, which, as Coleridge observes, stops not at 'This will be so,' but at once decides, 'This must be so.' Now, in all cases where motion is communicated from one body to another, the line of communication must be maintained unbroken. The first impulse gives motion to certain atoms, which in their turn propel others, and so on, till the whole series between the active body and the body which is to receive the original impulse is set in motion, and then, at length, the sequence of events is complete, and the body, towards which motion tended, is set vibrating. If the medium that propagates the first impulse be undulatory and elastic, its atoms only oscillate on either

side a fixed point of rest; but, if it be composed of travelling atoms, there is an actual progression of the medium. In either case, motion is propagated by a real action of matter till it reach its final destination. This is the history of all communicated motion, and it is plain that this holds good whether we behold the collection of atoms, in a bodily shape, that transmits the motion, as in the case of one billiard ball propelling another, or whether we behold them not, as in the case of sound being communicated to the ear from a vibrating body, by means of the intervening air. I grant that the old axiom, 'A body cannot act where it is not,' is very properly exploded; but for it we must substitute another, namely, 'A body cannot act where it is not, save by deputy, or transmissive means.'"

But his experiments go far beyond this direct transmission, for he relates:—

"One evening, when sitting with my family, the idea occurred to me,—'Could I mesmerise Anna M—— there, as I then was, while she was in her own house?' to which I knew she was just then confined by slight indisposition. Acting on this thought, I begged all the party present to note the hour (it was exactly nine o'clock), and to bear me witness that then and there I attempted a mesmeric experiment. This time I endeavoured to bring before my imagination very vividly the person of my sleep-waker, and even aided the concentration of my thoughts by the usual mesmeric gestures; I also, at the end of an hour, said, 'I will now awake Anna,' and used appropriate gestures. We now awaited with more curiosity than confidence the result of this process. The following morning Anna made her appearance, just as we were at breakfast, exclaiming, 'Oh, sir! did you magnetise me last night? About nine o'clock I fell asleep, and mother and sisters say they could not wake me with all their shaking of me, and they were quite frightened; but after an hour I woke of myself; and I think from all this that my sleep must have been magnetic. It also did me a great deal of good, for I felt quite recovered from my cold after it. After a natural sleep I never feel so much refreshed. When I sleep for an hour in magnetism, it is as if I had rested a whole night.' These were the words of Anna M——, noted down at the time as accurately as possible."

And again:—

"Once standing near Anna M—— I addressed to her a sentence mentally, but she did not comprehend it, though, that I wished to say something to her, and that there was an action of my mind, she manifested knowledge. Her words on this occasion were remarkable. 'Why do you speak so low, sir? Speak louder, that I may hear you!' Now, be it remembered, I had not spoken at all, nor given her to understand, in any way, that I was about to address any thing to her. One experiment, however, of this nature, was almost invariably successful. If I mentally ran over a tune in my head, Anna would immediately begin to beat time, and sway her head about in the measure of the air. Anxious to have a correct witness of the experiment, I agreed with a musician that at a certain silent signal I should begin mentally to repeat an air, and, at another signal, change the air and measure from slow to fast. I made the musician acquainted with both the airs beforehand, in order that he might accurately judge whether the sleep-waker kept to the time. The experiment answered perfectly, both as to beating time, in the first place, with accuracy, and then as accurately

changing the measure. I could relate a crowd of other circumstances of a similar nature, and some perhaps even more remarkable than the above; but I forbear: the above are sufficient to illustrate the principle which I am endeavouring to deduce from facts. Should the principle itself remain unacknowledged, I shall have already drawn too largely on the faith of my reader."

He thus concludes:—

"With facts like these before us, where, but to the mesmeric medium, shall we look for indications of that inner body—that germ of a better existence, which analogy shews must be so intimate a part of us, and which is nevertheless so much a stranger to ourselves? Where, but in the medium of the fundamental sensation, shall we look for the fundamental life; for are not, in truth, life and sensation identified in their purpose, at least, of bringing us into sensible connexion with the world of matter? This being admitted, there is no difficulty in conceiving that this action, as relates to the mesmeric medium, shall be continuous. As now it so manifestly appears to be an intermediate between us and our present body, so hereafter it may become the means of linking us to a new organisation; or it may itself remain as our spiritual body, appropriated to us in a certain portion, when this visible and fleshly tabernacle is dissolved to its primal elements. Where shall we find so obedient a servant to our commands? where force to our strong desire after individual existence? where an agency so swift, powerful, and penetrating; so near to our essence, so kindred to our thoughts? In proportion as we value whatever tends to bridge our way across the gulf of death, whatever tends to carry on a train of old familiar thought into the unknown void, let us esteem, cherish, and reverence this cheering manifestation of our being, which so beautifully exhibits a pre-existent harmony between our human hopes and their accomplishment. That the mesmeric medium should link science to science is comparatively but a trifling benefit. That it should connect this world with a future is its last and greatest service."

Well, there may be more things in heaven and earth than are dreamed of in our philosophy. Mr. Townshend is above suspicion as a person who would artfully deceive us in the slightest degree; and, if not imposed upon himself—if he has not let the belief in this marvel make fools of his other senses, and attributed results to false data, we must acknowledge that he is a powerful ally to Dr. Elliotson,—another gentleman whom we suppose no one ever thought capable of seeking aught but the truth in these strange investigations.
